a, fruit; b, section of fruit (Bentley & Trimen).

starch, woody fibre, &c.) two alkaloids closely related to each other, which act as powerful poisons on the animal frame, and speedily occasion violent tetanic convulsions and death. These alkaloids are named *Strychnine* and *Brucin*, and exist in the seeds in combination with lactic and strychnic (or igasuric) acids. For a method of obtaining strychnine from the seeds, see the *British Pharmacopæia*; and for the poisons, see BRUCIN and STRYCHNINE.

Nyam-Nyams. See NIAM-NIAM.

Nyangwe, an Arab trading station on the Upper Congo or Lualaba, at the edge of the Manyema country, in 4° 20' S. lat. From that point Stanley commenced the descent of the Lualaba in 1876.

Nyanza. See ALBERT NYANZA, VICTORIA NYANZA, MUTA NZIGE.

Nyassa, or NYANJA, the southernmost of the equatorial great lakes of East Africa, is situated about 260 miles SE. of Tanganyika and 400 inland from the east coast. It lies at an altitude of 1570 feet, is very deep in the middle, shelving rapidly from the shores, which are rocky and high. Long and narrow, it measures 350 miles from north to south and an average of 40 from east to west. The river Shiré emerges at its southern extremity, and goes south to the Zambezi. The waters of the lake are sweet and abound in edible fish. Although the Portuguese had knowledge of the existence of the lake under the name of Maravi early in the 17th century, Livingstone was the first to fix in 1859 its exact situation and to navigate it.

NYASSALAND, a name applied to the regions immediately south, west, and north-west of Lake Nyassa, but without conveying any precise limitation of boundaries, practically means the region in which the African Lakes Company of Glasgow has carried on its operations since its foundation in

1878; it works hand in hand with the missionaries of the Established and the Free Church of Scotland, whose principal stations are at Blantyre, some distance to the south of the lake, and Bandawe, half-way up its western side. Both the commercial company and the mission stations were founded in response to representations by Dr Livingstone, for the express purpose of counteracting the slave-dealings of the Arab marauders, and they have had much trouble owing to the hostility of these people. Some trouble too has been occasioned of late years by Portugal, who claimed to exercise sovereignty over the region. See ZAMBESIA.

Nyāya, the second of the great systems of ancient Hindu philosophy. See SANSKRIT LITERATURE.

Nyborg. See FÜNEN.

Nyctaginaceæ, a natural order of plants, consisting partly of herbaceous plants, both annual and perennial, and partly of shrubs and trees. There are about 100 known species, natives of warm countries. Some have flowers of considerable beauty, as those of the genus *Mirabilis*, known in our gardens as *Marvel of Peru*, one of which, *M. Jalapa*, was at one time erroneously supposed to produce jalap. The roots of many are fleshy, purgative, and emetic.

Nyctalopia (Gr. *nyx*, 'night'; *ōps*, 'the eye'), the defective vision of persons who can see in a faint light but not in bright daylight; sometimes applied to the opposite defect, inability to see save in a strong daylight.

Nycteribia, very remarkable, wingless, spider-like, Dipterous insects, parasitic on bats.

Nykerk, or NIEUWKERK, a small town in the Dutch province of Gelderland, 28 miles SE. of Amsterdam by rail, and 1½ mile from the Zuider Zee. Pop. 7599.

Nyköping, a seaport of Sweden, situated on a bay of the Baltic, 62 miles SW. of Stockholm (100 miles by rail), manufactures machinery and cotton. The castle, now ruined, ranked in point of strength next to those of Stockholm and Calmar. King Waldemar was imprisoned here after his dethronement in 1288, till his death in 1302. Eric and Waldemar, brothers of King Birger, were left in 1317 to perish of hunger in a dungeon, the keys of which the king threw into the sea. In horror of this deed the people seized the castle and demolished it. In 1719 the town was taken and dismantled by the Russians. Pop. (1885) 5374.

Nyl-ghau (*Portax tragocamelus*), a species of antelope, with somewhat ox-like head and body, but with long slender limbs, and of great activity and fleetness. It is one of the largest of antelopes, and is more than four feet high at the shoulder. The horns of the male are about as long as the ears, smooth, black, pointed, slightly curved forwards. The female has no horns. The neck is deep and compressed, not rounded as in most of the antelopes. A slight mane runs along the neck and part of the back, and the breast is adorned with a long hanging tuft of hair. The back is almost elevated into a hump between the shoulders. The nyl-ghau inhabits the dense forests of India and Persia, where it has long been regarded as one

of the noblest kinds of game. The name is Persian, and signifies 'blue ox.' It is often taken, like other large animals, by the enclosing of a large space with nets, and by great numbers of people. It is a

Nyl-ghau (*Portax tragocamelus*).

spirited animal, and dangerous to a rash assailant. It is capable of domestication, but it is said to manifest an irritable and capricious temper.

Nymphaeaceæ, a natural order of exogenous plants, growing in lakes, ponds, ditches, and slow rivers, where their fleshy root-stocks are prostrate in the mud at the bottom; and their large, long-stalked, heart-shaped, or peltate leaves float on the surface of the water. Their flowers also either float or are raised on their stalks a little above the water. The flowers are large, and often very beautiful and fragrant. There are usually four sepals, and numerous petals and stamens, often passing gradually into one another. The ovary is many-celled, with radiating stigmas, and very numerous ovules, and is more or less surrounded by a large fleshy disc. The seeds have a farinaceous albumen. More than fifty species are known, mostly natives of warm and temperate regions. The root-stocks of some of them are used as food, and the seeds of many. See WATER-LILY, LOTUS, VICTORIA, and EURYALE.—Very nearly allied to Nymphaeaceæ are Nelumbiaceæ. See NELUMBO.

Nymphs, in Greek Mythology, female divinities of inferior rank, inhabiting the sea, streams, groves, meadows and pastures, grottoes, fountains, hills, glens, and trees. Among them different classes were distinguished, particularly the *Oceanides*, daughters of Oceanus (nymphs of the great ocean which flows around the earth), the *Nereids*, daughters of Nereus (nymphs of the inner depths of the sea, or of the Inner Sea—the Mediterranean), *Potameides* (River nymphs), *Naiads* (nymphs of fountains, lakes, brooks, wells), *Oréads* (Mountain nymphs), *Napææ* (nymphs of glens), and *Dryads* or *Hamadryads* (Forest nymphs, who were believed to die with the trees in which they dwelt). They were the goddesses of the fertilising power of moisture, possessed prophetic power, and took interest in the nourishment and growth of infants, the chase, and dancing. They are among the most beautiful conceptions of the plastic fancy of the ancient Greeks. See Krause, *Die Museen, Grazien, Horen und Nymphen* (Halle, 1871).—For Nymph in natural history, see CHRYSALIS.

the fifteenth letter of our alphabet, is the only letter which cannot be traced to the Egyptian hieroglyphics. It is believed to have been an ideographic picture invented by the Semites to express a sound only found in Semitic languages.

This supposition is supported by the correspondence of its Semitic name 'ayin, which means an 'eye,' with its oldest form **𐤀**, which may be regarded as the picture of an eye. The sound of 'ayin was a faucal breath, resembling the *h* in *huge*. The Greeks, who took over the Phœnician alphabet, having no corresponding sound in their language, used the symbol for the vowels *ō*, *ou*, and *ō*, which they required. In the earliest Greek inscriptions **Ο** represents all three sounds. About 550 B.C. the symbol was differentiated, the closed form *ο*, called *omicron*, or 'little *o*,' being appropriated for the short *ō*, while it was opened out at the bottom, **Ω**, to represent the long *ō*, which was called *omega* or 'great *o*.' In the Italic alphabets, which were obtained from Greece before the invention of *omega*, only the first of these symbols appears, whereas in the Runes, which were obtained at a somewhat later date, the vowel *o* is expressed by a symbol derived from *omega*. In our English alphabet this letter has been more stable than any other. Its form is the same as that found on the Moabite stone, and its value agrees with its value in Greek and Latin, while it is the only English vowel which normally possesses the same sound which it has in French, German, and other modern continental languages. The sound is intermediate between *a* and *u*, and may arise out of either—i.e. it may represent an Anglo-Saxon *a* or *u* as well as an Anglo-Saxon *o*. In English it has three values: the name-sound heard in *note*, which is the original sound, the shorter sound heard in *not*, and the neutral vowel heard in *son*. In English the name-sound may be represented in ten ways, as in the words *pole*, *goat*, *toe*, *yeoman*, *sow*, *sew*, *haut-boy*, *beau*, *owe*, and *though*.

Oahu. See HAWAII.

Oajaca, a mountainous state in the south of Mexico (q.v.), bordering on the Pacific. The capital, Oajaca, lies 5060 feet above the sea, in the fertile valley of the Atoyac. It contains a large cathedral (1729), a quaint bishop's palace, the Seminario Tridentino, and the State Institute, with thirty-four professors. The manufactures are chiefly chocolate, cotton goods, cigars, candles, and soap. Pop. (1887) 27,856.

Oak (*Quercus*), a genus of trees and shrubs of the natural order Cupulifere, having monoecious flowers, the male in slender catkins or spikes, the female solitary or clustered; the fruit a nut or acorn, oblong, ovoid, or globular, protruding from a woody cup formed by the enlarged scales of the involucre; the leaves are deciduous or evergreen, alternate, entire, lobed, or sinuate. The species, of which there are about 300, are spread over nearly the whole of the northern hemisphere, except the extreme north. They are more numerous in

America than in Europe; a few are found in Asia, none in tropical Africa, in Australia, or in South America except about the Andes. The Common or English Oak (*Q. robur*) is the most widely distributed of the species. It extends all over Europe, except the extreme north, and penetrates into central Asia by way of the Caucasus. In Britain there are two well-marked 'races,' which in their more extreme forms have been designated and described by some authorities as species, while by others they are, and with better reason, regarded merely as distinct seminal varieties of *Q. robur*.

Fig. 1.—Common Oak (*Quercus robur pedunculata*): a, branch in fruit; b, male flower; c, female flower.

The form that is most common—*Q. r. pedunculata*—is characterised by having stalkless or nearly stalkless leaves, while the acorns are borne on more or less elongated stalks. The other form—*Q. r. sessiliflora*—has these features inverted; the leaves are stalked and the acorns stalkless. The former is found most plentifully in the south and midland counties of England, the latter in the west and north, and in Scotland. But though these peculiarities of structure and geographical distribution are more or less true and constant, the two forms are not only found growing together in all districts, but the extremes of structural difference are also linked together by individual trees which exhibit every intermediate gradation of structural disparity. The Durmast Oak (*Q. r. sessiliflora pubescens*), which is most abundant in the New Forest, Hampshire, differs only from the stalkless fruited variety in having the leaves more or less downy on the under side, and in retaining them longer in winter than either of the others. But this variety is also found in company with the others in different parts of the country.

Prior to the introduction of iron into shipbuilding, when 'hearts of oak were our ships,' the comparative merits of the timber of these several forms of oak were vigorously discussed both in Britain and in France, but with so much contradictoriness of assertion that sound conclusions could not be deduced. So much is the quality of oak timber

affected by the soil and other circumstances in which the trees grow, that it is not improbable that the advocates on either side may have unwittingly confounded the wood of one variety with that of the other. The strength and durability of the timber of either kind is as unquestionable as is the extreme longevity of the trees. The timber of no other European tree combines in itself the essential elements of strength and durability, hardness and elasticity, in the same degree as the oak. Longevity is a characteristic of all species of oak, but the British oak is celebrated above all others for the great age to which it attains. In many districts of England, and in a few also of Scotland, there exist huge venerable living remains of giant oaks, whose age cannot be computed with accuracy, but which, when compared with younger trees authentically known to be 300 or 400 years old, may, without improbability, be reckoned to have stood for more than 1000 years. Many of these ancient trees are historical landmarks, being associated with the events and the names of persons of the remote past. Legendary though some of these associations may appear to be when applied to such as the 'King Oak,' in Windsor Forest, which is said to have afforded shade and shelter to William the Conqueror, it is far from improbable that the tree may have been of considerable age at the time of the Conquest. The circumference of the trunk of this tree in 1864, at 3 feet from the ground, was 26 feet. But there are many larger living oaks in other parts of the country. The Cowthorpe Oak, for instance, in the village of that name, 6 miles S.E. of Knaresborough, measured, at 3 feet from the ground, 48 feet in circumference. This tree is simply a wreck of former grandeur, yet lives and puts forth leaves annually. Taking the less favourable character of the climate of the West Riding of Yorkshire, when compared with that of Windsor Forest, into account along with the immensely greater bulk of the Cowthorpe Oak than the King Oak, it is not extravagant to assume that the former may be twice the age of the latter. The oak from remotest antiquity has had a celebrity among trees; it has been regarded as the 'Monarch of the Forest.' It was held sacred by the Greeks and Romans and by the ancient Gauls and Britons. The history of the use of the timber of the oak as material for shipbuilding may be said to date from the time of King Alfred (see NAVY). The timber is also employed in architecture, cabinet-making, carving, mill-work, and coopering; and the sawdust was formerly employed in the dyeing of fustian.

Fig. 2.—Sessile-fruited Oak (*Quercus robur sessiliflora*) Branch in Fruit.

ity, be reckoned to have stood for more than 1000 years. Many of these ancient trees are historical landmarks, being associated with the events and the names of persons of the remote past. Legendary though some of these associations may appear to be when applied to such as the 'King Oak,' in Windsor Forest, which is said to have afforded shade and shelter to William the Conqueror, it is far from improbable that the tree may have been of considerable age at the time of the Conquest. The circumference of the trunk of this tree in 1864, at 3 feet from the ground, was 26 feet. But there are many larger living oaks in other parts of the country. The Cowthorpe Oak, for instance, in the village of that name, 6 miles S.E. of Knaresborough, measured, at 3 feet from the ground, 48 feet in circumference. This tree is simply a wreck of former grandeur, yet lives and puts forth leaves annually. Taking the less favourable character of the climate of the West Riding of Yorkshire, when compared with that of Windsor Forest, into account along with the immensely greater bulk of the Cowthorpe Oak than the King Oak, it is not extravagant to assume that the former may be twice the age of the latter. The oak from remotest antiquity has had a celebrity among trees; it has been regarded as the 'Monarch of the Forest.' It was held sacred by the Greeks and Romans and by the ancient Gauls and Britons. The history of the use of the timber of the oak as material for shipbuilding may be said to date from the time of King Alfred (see NAVY). The timber is also employed in architecture, cabinet-making, carving, mill-work, and coopering; and the sawdust was formerly employed in the dyeing of fustian.

The bark is of great value as furnishing tan for the use of the tanner. It yields a bitter extract named *Quercine*, which is employed in medicine as a tonic and astringent. Colouring matter is also obtained from it, which is used in dyeing wool. The acorns are excellent food for swine; and their im-

portance for this purpose is clearly shown by the pannage laws enacted by Ine, king of Wessex, in the 7th century, for the regulation of rearing and fattening hogs, then, and for centuries afterwards, perhaps the most important agricultural pursuit of the people. Although the fruit of the British oak is neither so palatable nor so easily digested as to recommend itself for human food, that of many other oaks is sweet, wholesome, and nutritious. In Turkey the acorns of several kinds, after being buried in the ground for some time to deprive them of their bitter principle, are dried, washed, and ground to powder along with sugar and aromatics. The compound thus prepared is called *palamonte*, and a food is made from it named *racahout*, which is much esteemed by the ladies of the seraglios for maintaining their plumpness and good condition. The Barbary Oak (*Q. ballota*), the Evergreen Oak (*Q. ilex*), the Italian Oak (*Q. Esculus*) are European and African species, the fruit of which, especially that of the first named, is sweet and nut-like in flavour and wholesome to eat. The Dwarf Chestnut Oak (*Q. prinoides*), a North American species, and several others of that country also produce edible acorns. Among other oaks remarkable for the utility of their products are the Cork Oak (*Q. suber*; see CORK); the Valonia Oak (*Q. aegilops*), native of the Levant, and cups of which are said to contain more tannin per given bulk of substance than any other vegetable; the Black or Quercitron Oak (*Q. tinctoria*), an abundant native of the United States, the bark of which yields the *Quercitron* dye of commerce; the Gall Oak (*Q. infectoria*), a native of Asia Minor, furnishing the *gall-nuts* of commerce (see GALLS); the Kermes Oak (*Q. coccifera*), a native of the south of Europe, the Levant, and the north of Africa, which supplies the *kermes* or *scarlet grain* of commerce (see DYEING, Vol. IV. p. 139); and the Manna Oak (*Q. mannifera*), a native of Kurdistan, which secretes on its leaves in warm weather a sweet mucilaginous substance, that is made into highly esteemed sweetmeats. The timber of most of the American oaks is valuable. The following are the most esteemed as timber-trees: the White Oak or Quebec Oak (*Q. alba*), spread from the Gulf of Mexico to Canada, regarded as only inferior in quality to British oak; the Over-cup Oak (*Q. lyrata*), native of the southern states, occupying situations liable to inundation; the Chestnut-leaved White Oak (*Q. prinus*), also a native of the southern states; the Live Oak (*Q. virens*), extending from the Gulf of Mexico as far north as Virginia, regarded as the most valuable of American oaks for shipbuilding; the Red Oak (*Q. rubra*), pretty generally distributed in the United States and in Canada, furnishing the *Red Oak Staves* so much in demand in the West Indies. Of the Turkey Oak (*Q. cerris*) there are several interesting varieties, as the Fulham Oak (*Q. c. Fulhamensis*), which is semi-evergreen although the parent is strictly deciduous. The Austrian Oak (*Q. Austriaca*), the Evergreen or Holm Oak already named, and a number of the American species already noticed are much appreciated ornamental trees in Britain. Green oak is a condition of oak-wood caused by its being impregnated with the spawn of *Peziza aeruginosa*, which communicates a beautiful tint of green, and of which the turners and cabinet-makers of Tunbridge Wells avail themselves for inlaying, bead-making, &c.—The Common Oak and most others cultivated in Britain delight in deep moist loamy soil, in which, however, there should be no stagnant water. Great depth is of more consequence than superior quality of soil. Plantations of oak are slow in coming to marketable value, except in the shape of copsewood, for which the oak is one

of the best adapted trees, owing to the facility with which it stools or sends saplings up from its roots on being cut down. Copeewood oak is valuable for firewood, the making of charcoal for cooper work, and the making of crates, &c., while the bark is always marketable for the purpose of the tanner. The acorns of all species of oak supply oil in considerable quantity, which has been used in cookery and for other domestic purposes.

Many other trees bear the name oak popularly applied. Thus, the Poison Oak (*Rhus toxicodendron*), a shrub or small tree of North America, Indian Oak (*Tectona grandis*), African Oak (*Oldfieldia Africana*), and Stone Oak (*Lithocarpus javanensis*), which belongs to the same natural order with *Quercus*, are examples of the popular but erroneous use of the name oak.

See Evelyn's *Sylva* (1664); Strutt's *Sylva*; Camden's *Account of the New Forest*; Gilpin's *Forest Scenery*; Loudon's *Arboretum Britannicum*; *Trans. Highland and Agric. Soc.* (1881).

Oak-apple Day. See RESTORATION.

Oak-apples. See GALLS.

Oakham, the county town of Rutland, in the vale of Catmose, 25 miles WNW. of Peterborough. The castle, every peer passing which must forfeit either a horseshoe or a fine, is in ruins except the hall, used for county business. The fine parish church, with a lofty spire, was restored by Scott in 1858-59 at a cost of £8100; and Archdeacon Johnson's grammar-school (1584; reconstituted 1875) has an endowment of £1200 a year. Beer, boots, and hosiery are made. Pop. 3204.

Oakland, capital of Alameda county, California, is on the east side of San Francisco Bay, 4½ miles from San Francisco. It is a beautiful town, with wide streets adorned with evergreen oaks, and surrounded with gardens and vineyards. It is the terminus of the Southern Pacific Railroad, and steam ferry-boats ply constantly to San Francisco. Besides numerous churches and schools, a Congregational seminary, a large Roman Catholic college (1889), and the state home for the adult blind, the city contains canning-factories, manufactories of cotton and woollen goods, jute, iron, nails, shoes, pottery, carriages, and agricultural implements. Pop. (1870) 10,500; (1890) 48,682.

Oaks. See HORSERACING.

Oakum, a tangled mass of tarred hempen fibres, is made from old rope by untwisting the strands and rubbing the fibres free from each other. Its principal use is in Caulking (q.v.) the seams between planks, the space round rivets, bolts, &c., for the purpose of preventing water from penetrating. The teasing of oakum is well known as an occupation for prisoners in jail.

Oases (through Latin and Greek from the Coptic), fertile spots in a desert, due to the presence of wells or of underground water-supplies. The best known and most historically famous are those of the Libyan Desert and the Sahara; they occur also in the deserts of Arabia and Persia, and in the Gobi. The French have created many oases in the Algerian deserts by sinking Artesian Wells (q.v.). The chief vegetation of the African oases is palms—especially date and doom palms; with barley, rice, and millet, when the fertile area is large enough to admit of settled occupation. In the Libyan Desert are the oases of Siwa (where was the temple of Jupiter Ammon; see AMMON) in the north, Farafa, Bahriya, Dakhel, and Khargeh (the *oasis magna*, 120 miles W. of Thebes). In the western Sahara Tuat, 1000 miles SW. of Tripoli, is the best known; in the eastern Sahara are Fezzan (q.v.), Gadames (q.v.), Bilma (q.v.), and Air (q.v.) or Asben. See DESERT.

Oates, TITUS, was born about 1650, the son of a Norwich ribbon-weaver who, from an Anabaptist preacher under Cromwell, became at the Restoration rector of All Saints', Hastings, where the boy was baptised on 20th November 1660. He was brought up at Oakham school, Merchant Taylors' (1665), and Sedlescombe in Sussex; entered Caius College, Cambridge (1667); and two years later was admitted a sizar at St John's. Next taking orders, he held several curacies and a naval chaplaincy, but was as often expelled for infamous practices, of which perjury was not the worst. So, in concert with a Protestant alarmist, the Rev. Dr Tonge, he resolved to concoct the 'narrative of a horrid plot,' and, feigning conversion to Catholicism, was admitted as 'Brother Ambrose' to the Jesuit seminaries of Valladolid and St Omer. From both in a few months he was expelled for misconduct, but, returning to London in June 1678, he forthwith communicated to the authorities his pretended plot, the main features of which were a rising of the Catholics, a general massacre of Protestants, the burning of London, the assassination of the king, and the invasion of Ireland by a French army. Charles treated the story with contempt; but Oates swore to the truth of it before a magistrate, Sir Edmund Berry Godfrey, who on 17th October was found dead in a ditch—murdered probably by Titus and his confederates. All London straightway went wild with fear and rage; Shaftesbury skilfully fanned the excitement; and Oates became the hero of the day. A pension of £600 was granted him, and a suite of apartments at Whitehall set apart for his use; wherever he went the mob cheered him as the 'saviour of his country.' Bedloe, Carstairs, Dangerfield, and other wretches came forward to back or emulate his charges; the queen herself was assailed; and 2000 Catholics were cast into prison. Fifteen of them were executed, including five Jesuits and old Viscount Stafford; but after two years a reaction set in, and Oates was driven from his rooms in the palace. In May 1683 he was fined £100,000 for calling the Duke of York a traitor, and being unable to pay was imprisoned; in May 1685 he was found guilty of perjury, and sentenced to be stripped of his canonicals, pilloried, flogged, and imprisoned for life. The Revolution of 1688 set him at liberty; and a pension was even granted him of £300; but in 1696 he writes to the Secretary of State, describing his worse than utter destitution. He died 13th July 1705. See the Histories of Burnet, Echard, Lingard, and Macaulay.

Oath, in Law, is the declaration, attested by the name of God, which is required on entering certain public offices and before giving evidence in a court of justice. Of oaths taken on entering office, the most important is the coronation oath, administered to the sovereign by an archbishop or bishop of the Church of England in presence of all the people (see CORONATION). The oaths required to be taken to government by the holders of certain offices have now been reduced to three in number—the oath of allegiance, the official oath, and the judicial oath. The oath of Allegiance (q.v.), 'to be faithful and bear true allegiance to her Majesty,' and the official oath, 'to well and truly serve her Majesty,' must be taken by all the principal officers of state in England, Scotland, and Ireland. Short forms of these oaths are provided in the Promissory Oaths Act, 1868, and in a schedule appended to this statute will be found a complete list of the officials to whom these different oaths are to be tendered. All the judges of the land on entering office, take, in addition to the oath of allegiance, what is known as the 'judicial' oath, 'to do right to all manner of people after the laws and usages of this realm, without fear or favour, affection, or ill-will.'

Members of parliament now take only the oath of allegiance, which has come in the place of the several oaths of allegiance, supremacy, and abjuration formerly required from every member of both Houses of Parliament and from all persons holding office under the crown. Till comparatively recent times, oaths were required on many trivial occasions and from numerous classes of persons. By 5 and 6 Will. IV. chap. 62, and several succeeding statutes, however, nearly all these unnecessary oaths have been abolished and declarations have been substituted. Special oaths are, nevertheless, still taken by privy-councillors, by archbishops and bishops, by peers, baronets, and knights on their creation, by aliens on being naturalised, by recruits, and others.

The most important oaths affecting the general public are those which are administered in courts of justice to jurors and witnesses. Jurymen, who are called on to exercise their functions, whether in civil or criminal cases, are sworn 'to well and truly try the issue between the parties, and a true verdict give, according to the evidence.' Further, no person can give testimony upon any trial until he have in one form or another given a pledge that he will narrate the truth; he thus renders himself liable to the temporal penalties of perjury in the event of his wilfully and corruptly giving false testimony. In England, the oath which is administered to witnesses is in this form: 'The evidence I shall give shall be the truth, the whole truth, and nothing but the truth, so help me God.' The usage in England and Ireland is for the witness, after hearing the oath repeated by the officer of court, to kiss the New Testament by way of assent. The practice of kissing the book is a very old one, for there is extant (Cod. 3, 1, 14) an ordinance of the Emperor Julian prescribing that the oath be taken *sacrosanctis evangelis tactis*. In Scotland the witness, standing and holding up his right hand, repeats the oath after the judge, as follows: 'I swear by Almighty God, and as I shall answer to God at the great day of judgment, that I will tell the truth, the whole truth, and nothing but the truth.' Children under twelve years of age are never sworn, but are admonished to tell the truth. Children between twelve and fourteen may take the oath, but only if the judge is satisfied that they understood its nature. By the Act 1 and 2 Vict. chap. 105, legislative sanction has been given to the rule of the common law that all persons shall be bound by the oaths which are lawfully administered to them, 'provided they are administered in such form, and with such ceremonies as the parties sworn declare to be binding on their consciences.' Thus, a Jew is sworn on the Pentateuch, with his head covered; a Mohammedan, on the Koran, laying his right hand flat on the sacred book and then touching it with his forehead. A Chinaman is sworn by the ceremony of breaking a saucer before taking the oath. As regards the persons entitled to administer oaths, Lord Brougham's Act of 1851 provides that 'every court, judge, justice, officer, commissioner, arbitrator, or other person, now or hereafter, having by law or by consent of parties authority to hear, receive, and examine evidence, is hereby empowered to administer an oath to all such witnesses as are called before them.' Further, by statute (18 and 19 Vict. chap. 42) all diplomatic and consular agents abroad are empowered to administer oaths and do notarial acts. At the same time the old practice of persons voluntarily taking oaths before a justice of the peace—e.g. by a debtor as a further security to his creditors, and in various instances not connected with any judicial proceeding—has been put an end to by the statute 5 and 6 Will. IV. chap. 62. It is here enacted that it shall not

be lawful for any justice of peace, or other person, to administer or cause to be administered any oath, affidavit, or solemn affirmation, touching any matter of which he has no jurisdiction or cognisance. To some extent it is left to the discretion of the justice whether the particular matter is one as to which it is proper to administer an oath.

Of late years there have been made many alterations of the law as to oaths in relief of persons having conscientious scruples. Relief in this direction was first granted to Quakers, Moravians, and Separatists; they were allowed to make affirmation, whether as witnesses or on other occasions where an oath was formerly required (see AFFIRMATION). A further concession was made in 1854 to those who, not being Quakers, yet refused to take the oath from sincere conscientious motives, such being allowed also to affirm. Previous to 1869 atheists and persons who admitted that they had no religious belief were excluded from giving evidence in courts of justice. This exclusion of the testimony of atheists was put an end to, and at the same time the principle of substituting affirmations for oaths was largely extended by the Evidence Further Amendment Act of 1869 (32 and 33 Vict. chap. 68). This statute provides, 'If any person called to give evidence in any court of justice, whether in a civil or criminal proceeding, shall object to take an oath, or shall be objected to as incompetent to take an oath, such person shall, if the presiding judge is satisfied that the taking of an oath would have no binding effect on his conscience, make a promise and declaration in a statutory form (sect. 4). When in 1880 Mr Bradlaugh, member for Northampton, claimed to make an affirmation under these Evidence Amendment Acts in lieu of taking the usual parliamentary oath, a select committee of the House of Commons reported that the acts did not apply to the oath taken by members of parliament. This view was confirmed in 1883 by the courts of law in the case of *Clarke v. Bradlaugh*, 7 Q.B.D. 38. In 1883 the government brought in a bill permitting members of parliament to affirm, but it was lost. Finally, however, in 1888, a short statute, 51 and 52 Vict. chap. 46, provides that every person upon objecting to be sworn, and stating as the ground of such objection either that he has no religious belief, or that the taking of an oath is contrary to his religious belief, shall be permitted to make his solemn affirmation, instead of taking an oath, in all places and for all purposes where an oath is and shall be required by law, which affirmation shall be of the same force and effect as if he had taken the oath; and if any person making such affirmation shall wilfully, falsely, and corruptly affirm anything which, if affirmed on oath, would have amounted to perjury, he shall be liable to prosecution as if he had committed perjury. Further, the Act 52 and 53 Vict. chap. 63, sect. 3, provides that in every statute passed since 1850, unless a contrary intention appears, the expressions 'oath' and 'affidavit,' in the case of persons allowed for the time being to affirm or declare instead of swearing, include affirmation and declaration, and the expression 'swear,' in the like case, includes affirm and declare. All the enactments relating to the administration of oaths are consolidated by the statute 52 Vict. chap. 10, known as the Commissioners for Oaths Act. See *Stringer, Oaths and Affirmations in Great Britain* (1889).—United States statutes permit the making of affirmation by those who object to take oaths. Some states grant further relaxations than others.

Oats (*Avena*), a genus of edible grasses, containing many species, among which are some valuable for the grain which they produce, and some useful for hay. The Linnean genus *Avena*, as now

restricted, has the spikelets in loose panicles, the glumes as long as the florets, and containing two or more florets; the paleæ firm, and almost cartilaginous, the outer palea of each floret, or of one or more of the florets, bearing on the back a knee-jointed awn, which is twisted at the base. The awn, however, tends to disappear, and often wholly disappears in cultivation. Those species which are cultivated as corn-plants have comparatively large spikelets and seeds, the spikelets—at least after flowering—pendulous. The native country of the cultivated oats is unknown, although most probably it is central Asia. There is no reference, however, to the oat in the Old Testament; and although it was known to the Greeks, who called it *Bromos*, and to the Romans, it is probable that they derived their knowledge of it from the Celts, Germans, and other northern nations. It is a grain better suited to moist than to dry, and to cold than to warm climates, although it does not extend so far north as the coarse kinds of barley. The grain is either used in the form of groats or made into meal. Oatmeal cakes and porridge form great part of the food of the peasantry of Scotland and of some other countries. Oatmeal is now more largely used as food amongst the wealthier classes than formerly, but with the working-classes, alike in town and country, it is losing favour. No other grain is so much esteemed for feeding horses. Besides a large quantity of starch—about 65 per cent.—and some sugar, gum, and oil, the grain of oats contains almost 20 per cent. of nitrogenous principles, or protein compounds, of which about 16 or 17 parts are *Avenin*, a substance very similar to *Casein* (q.v.), and two or three parts gluten, the remainder albumen. The husk of oats is also nutritious, and is mixed with other food for horses, oxen, and sheep. From the starchy particles adhering to the husk or seeds after the separation of the grain, a light dish, long popular in Scotland under the name of *sovans*, is made by means of boiling water. The grain is sometimes mixed with barley for distillation. The Russian beverage called *kvass* is made from oats. The straw of oats is very useful as fodder, bringing, for that purpose, a higher price than any other kind of straw.

The varieties of oats in cultivation are very numerous, and some highly esteemed varieties are of recent and well-known origin. It is doubtful if they really belong to more than one species; but the following are very generally distinguished as species: (1) Common Oat (*A. sativa*), having a very loose panicle, which spreads on all sides, and two or three fertile florets in each spikelet, the paleæ quite smooth, not more than one floret awned; (2) Tartarian Oat (*A. orientalis*), also called Hungarian Oat and Siberian Oat, distinguished chiefly by having the panicle much more contracted, and all turned to one side; (3) Naked Oat (*A. nuda*), differing from the Tartarian oat chiefly in having the paleæ very slightly adherent to the seeds, which, therefore, fall readily out of them, whilst in the other kinds they adhere closely; (4) Chinese Oat (*A. chinensis*), which agrees with the last in the characters of the paleæ and seeds, but is more like the common oat in its panicle, and has more numerous florets, 4-8, in the spikelet; (5) Short Oat (*A. brevis*), which has a close panicle turned to one side, the spikelets containing only one or two florets, each floret awned, the grains short. Almost all the varieties of oat in cultivation belong to the first and second of these species. The naked oat is cultivated in Austria, but is not much esteemed. The Chinese oat, said to have been brought by the Russians from the north of China, is prolific, but the grain is easily shaken out by winds. The short oat is cultivated as a grain-crop

on poor soils at high elevations in the mountainous parts of France and Spain, ripening where other kinds do not; it is also cultivated in some parts of Europe as a forage plant.—Besides these, there is another kind of oat, the Bristle-pointed Oat (*A. strigosa*), regarded by some botanists as belonging even to a distinct genus, *Danthonia*, because the lower palea is much prolonged, and instead of merely being bifid at the point, as in the other oats, is divided into two long teeth, extending into bristles. The panicle is inclined to one side, very little branched; the florets, two or three in a spikelet, all awned, the grain rather small. This plant is common in cornfields, is cultivated in many countries, but chiefly on poor soils, and was at one time much cultivated in Scotland, but is now scarcely to be seen as a crop.—Not unlike this, but with the panicle spreading equally on all sides, the outer paleæ merely bifid, and long hairs at the base of the glumes, is the Wild Oat (*A. fatua*), which is generally regarded by farmers as a weed to be extirpated, springing up so abundantly in some districts as to choke crops of better grain. Its awns have much of the hygrometrical property which gains for *A. sterilis*, a species found in the south of Europe, the name of the Animal Oat, because the seeds when ripe and fallen on the ground resemble insects, and move about in an extraordinary manner through the twisting and untwisting of the awns. The seed of the Wild Oat has been sometimes used instead of an artificial fly for catching trout.—Amongst the species of oat useful not for their grain but for fodder are the Downy Oat-grass (*A. pubescens*) and Yellow Oat-grass (*A. flavescens*), both referred by some botanists to the genus *Trisetum*—the short awn being like a middle tooth in the bifid palea—and both natives of Britain, the former growing on light ground and dry hills, especially where the soil is calcareous, the latter on light meadow-lands.

Far more ground is occupied with oats in Scotland than with any other grain. In all the higher districts it is almost the only kind of grain which is cultivated. Throughout Scotland it is the crop that is chiefly sown after land has been in pasture for one or more years. The seed is generally sown broadcast by hand over the ploughed land, which is afterwards well harrowed and rolled. Sowing by broadcast or drill machines is now largely practised, and in this case the harrowing is done before the seed is sown. On soils that are infested with annual weeds, such as charlock, it is common to drill the seed, which permits the land to be hand-hoed and thoroughly cleaned. Oats thrive best upon deep and good soils, especially if enriched by decayed vegetable matter. They yield but poorly on thin sandy soils, where they suffer sooner from drought than barley, rye, or wheat. The produce per acre varies from 20 to over 80 bushels, weighing from 36 lb. to 48 lb. per bushel. Common yields run from 32 to 56 bushels; average weight from 40 lb. to 44 lb. per bushel. A crop of 45 bushels per acre will absorb and carry away about 55 lb. of nitrogen, 46 lb. of potash, and 19½ lb. of phosphoric acid per acre. Few soils, in ordinary tillage, require the direct application of potash for oats. Very light soils are most likely to need it. Superphosphate of lime and nitrate of soda are suitable manures for oats; common quantities being from 1 to 2 cwt. of the former and from ½ to 1 cwt. per acre of the latter, applied as a top-dressing. The Potato Oat is a variety generally cultivated in the best soils and climates. It is an early and productive variety. The Hopetoun Oat is also much sown in the earliest districts. The Sandy Oat is still more largely sown, more particularly when the climate is inferior and wet. It is not liable to be lodged with rains, and the straw

is of fine quality for fodder. All these are varieties of the Common Oat. The White and Black Tartarian are much cultivated in some districts. They are very productive, and well suited for feeding horses, cattle, and sheep. On the continent of Europe this grain is seldom seen of quality equal to what is produced in Scotland; even in most parts of England the climate is less suitable to it, and it is less plump and rich.

Ob, or **Obi**, the great river of Western Siberia, rises in two branches, the Biya and the Katun, both of which have their origin in the Altai Mountains, within the frontier of the Chinese dominions; and flows north-west and north for 2120 miles to the great Gulf of Ob in the Arctic Ocean. Its chief tributaries are the Irtysh, Tcharysh, Tom, and Tchulym, all navigable. On the banks of the Ob are Barnaul, Tomsk, and Naryn. At present only a few steamers ply on the great water-system of the Ob, which nevertheless seems destined to become a great commercial thoroughfare. The explorations of Professor Nordenskiöld, but more especially the tentative voyages of Captain Wiggins in 1874 and 1876, from Dundee through the Kara Sea to the Gulf of Ob, repeated in later years, have proved the feasibility of this direct route, and the accessibility of the great navigation system of the Siberian river to west European commerce.

Obadiah, the shortest book in the Old Testament canon, the work of one of the twelve 'minor prophets,' of whose personality absolutely nothing is known. The name is not uncommon, meaning 'servant of Jehovah,' and was borne by the devout chamberlain of Ahab (1 Kings, xviii. 3-16), who protected the prophets of the Lord from the fury of Jezebel. Delitzsch thinks the author of the prophecy may have been identical with the Obadiah mentioned in 2 Chron. xvii. 7, as one of the Levites sent by Jehosaphat to teach the law in the cities of Judah. From internal evidence the date of composition of the book may, with much probability, be put shortly after the capture of Jerusalem by Nebuchadnezzar, about 587 B.C. The book was placed next to Amos merely because the prophecy of doom upon Edom is an amplification of that pronounced earlier by Amos (Amos, ix. 12). This passage in Obadiah (verses 1-9) is closely parallel to Jeremiah, xlix. 7-22, from which indeed Knobel, Bleek, and Reuss think it directly borrowed. Ewald maintained that the first seven verses of Obadiah were written by a prophet of that name during the inroads of Rezin and Pekah, that the eleventh refers to the capture of Jerusalem by the Arabs and Philistines in the reign of Jehoram, and that the remaining verses were compiled by a later writer, partly from the older prophet (who was also used by Jeremiah), and partly from other sources. Caspari offers strong reasons for his statement that the words of Obadiah were modified and expanded by Jeremiah. Some scholars again, as Keil, have supposed unnecessarily that Joel, ii. 32, is a distinct reference to Obadiah 17. The book of Obadiah possesses high individuality of style, and contains some peculiar words. It has ever been favourite reading among the Jews, and it was from it that they derived the name of 'Edom' as applied to Rome, to Christians, and all their enemies. The book falls naturally into two well-marked divisions, of which the first (1-16) denounces destruction to Edom, and the second (17-21) prophecies the restoration of Israel.

See the commentaries on the prophet by Ewald, Orelli, Hitzig, Keil and Delitzsch, and Pusey; the books on Hebrew prophecy by Kuenen (Eng. trans. 1877), Robertson Smith (1882), Duhm (1875); also the special commentaries by Hendewerk (1836) and Caspari (Leip. 1842); Archdeacon Perowne in the 'Cambridge Bible for Schools' (1883), and Farrar's *Minor Prophets* (1890).

O'ban, a fashionable watering-place of Argyllshire, 84 miles WNW. of Stirling, and 136 of Edinburgh, by a railway opened in 1880. It curves round a beautiful and almost land-locked bay, which, sheltered from every wind by the island of Kerrera on the west and by the high shores of the mainland, forms a spacious haven, crowded in summer by yachts and steamers. A mere 'clachan' when Dr Johnson visited it in 1772, Oban began to be feued in 1803-20, and in 1832 was constituted one of the Ayr parliamentary burghs. It is now the great tourist headquarters of the West Highlands, possessing some thirty hotels and splendid steamboat facilities. Objects of interest are the picturesque ruins of Dunolly and Dunstaffnage Castles (see **ETIVE**), and a prehistoric cave-dwelling, discovered in 1890. Pop. (1821) 1359; (1871) 2413; (1881) 3991; (1891) 4377.

Obé, or **Obi**, the name given to the magical arts or witchcraft practised by *Obeah-men* and *Obeah-women* among the negroes of the West Indies and the United States. It is substantially similar to the corresponding superstitions all the world over. See **HAYTI**, **NEGROES**, **MAGIC**, **WITCHCRAFT**; and H. J. Bell, *Obeah: Witchcraft in the West Indies* (1890).

Obeld, **EL**, capital of Kordofan, in the eastern Soudan, 220 miles SW. of Khartoum, consists of a number of villages, originally separate and inhabited by distinct races, but now joined together into one town. Gum-arabic, ivory, gold, and ostrich-feathers are the chief articles of trade. Pop. estimated at 35,000. Near this place, in 1883, a force of Egyptians under Hicks Pasha, with an English staff, was exterminated by a large army of the Mahdi.

Obelisk (Gr. *obelos*, *obeliskos*, 'a spit'), a word applied to four-sided monuments of stone and other materials, terminating with a pyramidal or pointed top. These monuments were placed upon bases before gateways of the principal temples in Egypt, one on each side of the door. They served in Egyptian art for the same purposes as the *stelæ* of the Greeks and columns of the Romans, and appear to have been erected to record the honours or triumphs of the monarch. They have four faces, are cut out of one piece, and are broader at the base than at the top, at a short distance from which the sides form the base of a pyramidion in which the obelisk terminates. They were placed upon a cubical base of the same material, which slightly surpassed the breadth of their base. Each side of the obelisk at the base measures $\frac{1}{4}$ th of the height of the shaft, from the base line to that where the cap or pyramidion commences. The cap is also $\frac{1}{4}$ th of the same height. Their sides are slightly concave, to increase their apparent height. Their height varies from upwards of 100 feet to a few inches. The sides are generally sculptured with hieroglyphs and representations, recording the names and titles of kings, generally in one line of deeply-cut hieroglyphs down each side. Hewn in the rough out of a solid piece in the quarries, they were transported down the Nile during the inundation, on rafts, to the spot where they were intended to be placed, and raised from their horizontal position by inclined planes, aided by machinery. Some obelisks, before their erection, had their pyramid capped with bronze gilded, or gold, the marks of such covering still being evident on their surfaces. The use of obelisks is as old as the appearance of art itself in Egypt; these grand, simple, and geometric forms being used in the 4th dynasty, and continued till the time of the Romans. Their object is enveloped in great obscurity. At the time of the 18th dynasty it appears that religious ceremonies and oblations

were offered to the obelisks, which were treated as divinities. Their sepulchral use is evinced by their discovery in the tombs of the 4th dynasty, and the vignettes of early papyri. The most of them date from the 18th and 19th dynasties. Two which formerly stood at Heliopolis (q.v.) were re-erected by Rameses II. at Alexandria, and have been

Cleopatra's Needle, Thames Embankment, London.

popularly known as Cleopatra's Needles. One, which long lay prostrate, was, after an adventurous voyage, brought to London in 1878, and erected on the Thames Embankment; it weighs 186 tons, and is 68½ feet high. The other, presented by the Khedive to the United States, was set up in Central Park, New York, in 1881. There are several large ones in Rome (that now at St Peter's having been taken to Rome by Caligula), one in Florence, one in Paris (given by Mehemet Ali in 1837), and Lepsius's in Berlin (the oldest and smallest of all, 2 feet 1½ inch high), besides many others that have found their way into European museums. By far the largest obelisk in the world is the Washington monument (1885), at Washington, D.C. It is of marble, 55 feet square at the base, and 555 feet high.

See Zoëga, *De Origine et Usu Obeliscorum* (1797); Birch, *Notes upon Obelisks* (1853); Gorrings, *Egyptian Obelisks* (1885).

Ober-Ammergau, a village in the valley of the Ammer in Upper Bavaria, 45 miles SW. of Munich, with 1400 inhabitants. Here the famous Miracle Play is performed every ten years. See MYSTERY.

Oberland. See BERN.

Oberlin, JOHANN FRIEDRICH, a pastor distinguished for his active benevolence and usefulness, was born at Strasburg, 31st August 1740, and in 1767 became Protestant pastor of Waldbach, in the Ban de la Roche or Steinthal, a wild mountainous district of Alsace. Here he spent the remainder of his life, combining an affectionate diligence in the ordinary duties of the pastorate with wise and earnest endeavours to promote the education and general prosperity of the people.

The district had suffered terribly in the Thirty Years' War, and the scanty population which remained was sunk in poverty and ignorance. Oberlin introduced better methods of cultivating the soil, and various branches of manufacture, and made roads and bridges where required. He founded an itinerating library, began the first infant schools, and introduced ordinary schools in the district. Pastor Oberlin was latterly consulted in all that concerned the temporal and spiritual welfare of the people. The population, which was scarcely 500 when he entered on his labours, had increased to 3000 at the close of the century. The district still continues prosperous, and the population in 1890 was 6000. Oberlin was ably assisted in his reformatory labours by his pious housekeeper, Louise Scheppeler, who survived her master eleven years. He died 1st June 1826. Notwithstanding the humble sphere in which his days were spent, his fame as a philanthropist has extended over the world, and his example has stimulated and guided many. The Royal Agricultural Society of France bestowed a gold medal upon him in 1818. A collected edition of his writings appeared at Stuttgart (4 vols. 1843).

Obermann. See SÉNANCOUR.

Oberon, the king of the elves or fairies, and the husband of Titania. The name is derived from the French *Auberon* or *Alberon*, and that from the German *Alberich* (*alb*, 'elf,' and *rich*). Oberon is first mentioned as 'Roi du royaume de la féerie' in the 13th-century French poem of *Huon de Bordeaux*. The quarrel between Oberon and Titania and their subsequent reconciliation through Huon, a French noble, and Amanda, daughter of the sultan of Babylon, whom the former leads home by the help of Oberon, after many difficulties, form the basis of this tale, which was afterwards shaped into a popular prose romance. The name first appeared in English in Lord Berners' translation (Early Eng. Text Soc. 1885), and was adopted in many ballads, and also in Greene's play, *The Scottish History of James IV.*, slain at Flodden. Neither these, however, nor Spenser's use made the name familiar, but Shakespeare's *Midsummer Night's Dream*, where, as Keightley points out, the fairy mythology is an attempt to blend the elves of the village with the fays of romance. The fairies here agree with the former in their diminutive stature, in their fondness for dancing, their love of cleanliness, and their child-abstracting propensities. Like the fays, they form a community ruled over by the princely Oberon and the fair Titania. Wieland used the subject for his well-known romantic poem, and Planché's adaptation of this forms the subject of Weber's opera. The old *chanson de geste* was edited by Guessard and Grandmaison (Paris, 1860). See Liebrecht's German translation of Dunlop's *History of Prose Fiction* (1851).

Obesity, or CORPULENCE, may be defined to be 'an accumulation of fat under the integuments or in the abdomen, or in both situations, to such an amount as to embarrass the several voluntary functions.' A certain degree of fatness is not only quite compatible with health, but, as has been shown in the article FATS, the fatty tissue is of considerable use in the animal body, partly in consequence of its physical and partly in consequence of its chemical properties; and it is only when the fatness begins to interfere with the discharge of any of the vital powers that it can be regarded as a morbid condition. Obesity may occur at any period of life, but it is most commonly after

the fortieth year that the tendency to an inordinate accumulation of fat begins to show itself. After that time, in the case of men the pleasures of the table are usually more attractive than in earlier life, and much less muscular exercise is taken; while in women the cessation of the power of child-bearing induces changes which tend remarkably to the deposition of fat. The extent to which fat may accumulate in the human body is enormous. Daniel Lambert (1760-1809) weighed 739 lb.; his exact height is not recorded, but, according to the investigations of the late Dr Hutchinson (the inventor of the spirometer), the normal weight of a man 6 feet high should not exceed 178 lb. Dr Elliotson has recorded the case of a female child, a year old, who weighed 60 lb.

The predisposing causes of obesity are a peculiar habit of body, hereditarily transmitted; inactivity; sedentary occupations, &c.; while the more immediate or exciting causes are a rich diet, including fatty matters, and matters convertible in the body into fats, such as saccharine and starchy foods, and the partaking of such a diet to a greater extent than is necessary for balancing the daily waste of the tissues. 'Fat meats, butter, oily vegetable substances, milk, saccharine and farinaceous substances are the most fattening articles of food; whilst malt liquors, particularly rich and sweet ale, are, of all beverages, the most conducive in promoting obesity. The fattening effect of figs and grapes, and of the sugar-cane, upon the natives of the countries where these are abundant, is well known. In various countries in Africa and the East, where obesity is much admired in females, warm baths, indolence, and living upon saccharine and farinaceous articles, upon dates, the nuts from which palm-oil is obtained, and upon various oily seeds are the means usually employed to produce this effect' (Copland's *Dictionary*). The knowledge of the means of inducing obesity affords us the best clue to the rational treatment of this affection. It is a popular belief that the administration of acids—vinegar, for example, or one of the mineral acids—will check the deposition of fat; but if the desired effect is produced it is only at the cost of serious injury to the digestive, and often to the urinary organs. The employment of soap and alkalis, as advocated a century ago by Flemming, is less objectionable than that of acids, but the prolonged use even of these is usually prejudicial. The efficacy of one of our commonest seaweeds, sea-wrack (*Fucus vesiculosus*), in this affection has also been strongly advocated. It is prescribed in the form of an extract, and its value is probably dependent on the iodine contained in it.

A very interesting *Letter on Corpulence*, published in 1863 by Mr William Banting (1797-1878), in which he records the effect of diet in his own case, after all medicinal treatment had failed, is well worthy of the attention of those who are suffering from the affection of which this article treats. The following are the leading points in his case. He was sixty-six years of age, about 5 feet 5 inches in stature (and therefore, according to Dr Hutchinson's calculations, ought to have weighed about 142 lb.), and in August 1862 weighed 202 lb. 'Few men,' he observes, 'have led a more active life . . . so that my corpulence and subsequent obesity were not through neglect of necessary bodily activity, nor from excessive eating, drinking, or self-indulgence of any kind, except that I partook of the simple aliments of bread, milk, butter, beer, sugar, and potatoes, more freely than my aged nature required. . . . I could not stoop to tie my shoe, nor attend to the little offices humanity requires without considerable pain and difficulty; I have been compelled to go down-stairs slowly backwards, to save the jar of increased

weight upon the ankle and knee joints, and been obliged to puff and blow with every slight exertion.'

By the advice of a medical friend he adopted the following plan of diet: 'For breakfast I take four or five ounces of beef, mutton, kidneys, broiled fish, bacon, or cold meat of any kind except pork; a large cup of tea (without milk or sugar), a little biscuit, or one ounce of dry toast. For dinner, five or six ounces of any fish except salmon, any meat except pork, any vegetable except potato, one ounce of dry toast, fruit out of a pudding, any kind of poultry or game, and two or three glasses of good claret, sherry, or Madeira: champagne, port, or beer forbidden. For tea, two or three ounces of fruit, a rusk or two, and a cup of tea without milk or sugar. For supper, three or four ounces of meat or fish, similar to dinner, with a glass or two of claret' (p. 18). 'I breakfast between eight and nine o'clock, dine between one and two, take my slight tea meal between five and six, and sup at nine' (p. 40). Under this treatment he lost in little more than a year (between the 26th of August 1862 and the 12th of September 1863) 46 lb. of his bodily weight, while his girth round the waist was reduced 12½ inches. He reported himself as restored to health, as able to walk up and down stairs like other men; to stoop with ease and freedom; and safely to leave off knee-bandages, which he had necessarily worn for twenty years past. He made his own case widely known by the circulation of his pamphlet (which has passed through several editions), and 'numerous reports sent with thanks by strangers as well as friends' show that 'the system is a great success;' and that it is so we do not doubt, for it is based on sound physiological principles. Other more or less similar systems have since been recommended; one, with two successful cases, is recorded in the *Edinburgh Medical Journal* for December 1890. Such a radical change of diet, however, should not be adopted without medical advice, as in some cases it might cause disturbance of digestion or excretion, and lead to new dangers to health. See FASTING, TRAINING.

Objl. See OB, and OBJ.

Object, and its correlative, **SUBJECT**, are terms used in a perplexing multiplicity of senses, the same author, philosophical or semi-philosophical, being frequently inconsistent in the meaning attached by him to the words. Thus, it may be said that while ordinarily the *subject* is the knowing mind, the *object* is that which is known, thought, felt, seen, imagined—the psychological corresponding fairly with the grammatical usage. At another time the subject is the ego, while the object is the non-ego, the external world, with an implication that the objective has a firmer, surer ground, if not wholly independent of the subjective, then at least less liable to vary or fluctuate. On the other hand, if the *noumenon*, the subject, is the truly real, the phenomenal object is comparatively an accident. Yet again, that which is the law of the consciousness, which is prior to experience, is by some regarded as more indefeasible and objective than the fleeting elements of conscious experience. For some, objective is that which is common to *all* minds (and to the absolute mind) at all times, and the subjective that which is peculiar to my mind or any given mind at any given time. Thus the essence of the subjective becomes the most objective thing in existence; really objective truth is that which from the nature of the case is prior to and independent of experience. It is needless to point out that, when the subject thinks of itself, the subject may be said to become its own object. In general, however, that is objective which deals

much with the external world, and that subjective which is mainly based on introspection of mental states.

In addition to the possibility of confusion arising out of current usage, it should be remembered that in the middle ages, and even in Descartes and Spinoza, *subject* nearly meant the same as *substance* (something highly real); and in William of Ockham *objective* is that which the mind feigns, the image or representative idea as opposed to the real object which exists independently. Object used as 'end,' 'aim,' 'purpose' ('with the object of doing so and so') is a barbarous but irrepressible abuse. Coleridge is by no means the only writer who fails to make himself clear about the distinction between 'omm-jective' and 'summ-jective,' as Carlyle represents him.

Oblates (Lat. *oblatus, oblata*, 'offered up'), the name of a class of religious bodies in the Roman Catholic Church, which differ from the religious orders strictly so called in not being bound by the solemn vows of the religious profession. The institute of oblates was one of the many reforms introduced in the diocese of Milan by St Charles Borromeo, towards the close of the 16th century. The members consisted of secular priests who lived in community, and were merely bound by a promise to the bishop to devote themselves to any service which he should consider desirable for the interest of religion. St Charles made use of their services chiefly in the wild and inaccessible Alpine districts of his diocese. The oblates of Mary Immaculate, founded at Marseilles in 1815, have nine houses in Britain, two in Ireland, and are numerous in Canada, British India, and the United States. Two Irish reformatorys are under their charge.

Obligation, DAYS OF, holidays on which faithful Catholics are bound to abstain from servile work and to hear mass. These are, for England and Wales, Circumcision, Epiphany, Ascension Day, Corpus Christi, SS. Peter and Paul, Assumption, All Saints, Christmas Day. Scotland adds to these St Andrew, and Ireland St Patrick and the Annunciation.

Obock, a French possession on the African coast of the Red Sea, inside Bab-el-Mandeb, and opposite Perim. Area, 2300 sq. m.; pop. (1886) 22,370.

Oboe (Fr. *hautbois*; Ger. *hoboe, hochholz*), a treble reed musical instrument, to which the bassoon may be said to be the bass. Its reed is double, like that of the bassoon and the chanter of the bagpipe, and consists of two thin blades of cane attached by silk thread to a short metal tube. A similar instrument may be traced from the earliest times from Egyptian and Greek sculpture and paintings; and the Kensington Museum contains many specimens from Arabia, China, India, Wallachia, &c. The modern instrument, however (shown in the figure), from successive improvements and additions bears little resemblance to its ancient prototype, and is one of the most complicated and intricate of wind-instruments. It is made variously of boxwood, ebony, cocoa-wood, and silver, having holes for the fingers and usually fifteen keys, besides two automatic octave keys to assist the higher notes. It is an octave instrument like the Flute (q.v.), and its usual compass is from B below the staff to F in alt, although several semitones higher can be produced.

For orchestral purposes it is pitched in the key of C, but in military bands a B \flat instrument is sometimes used, and its music is written in the G clef.

Oboe.

The tone of the oboe is rich, and, from its great power in swelling and diminishing the sound, it is capable of every variety of expression. The oboe has the privilege of giving the pitch to the violin in the orchestra. Beethoven, Mozart, Bach, and nearly all the great composers make extensive use of the oboe in their compositions. The Oboe d'Amore and the Oboe di Caccia, oboes in the key of A and F or E \flat respectively, are nearly obsolete. —*Oboe* is also the name of a treble stop on the organ, its bass being the *bassoon*. See 'Oboe,' in Grove's Dictionary.

Obolus (Gr. *obolos* or *obelos*, 'a spit'; see NUMISMATICS, p. 550), the smallest of the four common Greek coins and weights, the sixth part of a Drachma (q.v.).

O'Brien, WILLIAM SMITH, Irish patriot, was born 17th October 1803. Descended from the royal line of Thomond, to which belonged the great king, Brian Boru, he was the second son of Sir Edward O'Brien, Bart., of Dromoland, in County Clare, in favour of whose eldest son the ancient barony of Inchiquin was revived in 1862. He was educated at Harrow and Trinity College, Cambridge, and entered parliament for the pocket borough of Ennis in 1826. Though a Protestant, he supported the Catholic claims; and for some years he gave an independent support to the Tory party. He lost his seat in 1831, but was returned for the county of Limerick in 1835, and from that time till 1843 generally supported the Whigs. But he gradually gave up hope of getting justice for Ireland from the imperial parliament, and on the 20th October 1843 he announced his adhesion to O'Connell's Repeal Association. But O'Connell's rooted aversion to an appeal to *physical* force soon made a wide gulf in sympathy between his party and those fiery spirits who became known as 'Young Ireland,' and whose fervid and warlike poetry and prose filled the columns of the *Nation* newspaper. To this party O'Brien soon joined himself, and the moral force policy, by means of which O'Connell had gained so many triumphs, was now abandoned by the group of young and eager enthusiasts. The death of Thomas Davis in September 1845 removed a man of unusual wisdom and powers of conciliation, and after many angry disputes O'Brien in 1846 withdrew from the Association, and next the Young Irelanders set up a Repeal League of their own, under the leadership of O'Brien. His honour and patriotism are undoubted, not so his practical wisdom; and his ardent temperament and the sight of the sufferings of his country soon hurried him on to dangerous courses, and brought him into collision with the law. Still his views were much more moderate and sensible than those of some of the zealots of his party. The sentence of John Mitchel for 'treason-felony' in the spring of 1848 hastened the projected rising, which, however, proved a miserable fiasco, ending ludicrously in an almost bloodless battle in a cabbage-garden at Ballinagarry, in County Tipperary. Smith O'Brien was arrested, tried by a special commission at Thurles, and sentenced to death; but the sentence was commuted to transportation for life. In May 1854 he was released on condition of not returning to Ireland, and in 1856 he received a free pardon. He spent his remaining years in private life, partly at Bangor in North Wales, and died there, 16th June 1864. See A. M. Sullivan's *New Ireland* (1877), and Sir C. G. Duffy's *Young Ireland* (1880).

Obscene Prints, Books, or Pictures exhibited in public render the exhibitor liable to be indicted for a misdemeanour. Persons exposing them in streets, roads, or public places are also liable to be punished as rogues and vagabonds with hard labour. An important change in

the law was effected by Lord Campbell's Act, which was passed in 1857, to suppress the traffic in obscene books, pictures, prints, and other articles. Any two justices of the peace, or any police-magistrate, upon complaint made before him on oath that such books, &c. are kept in any house, shop, room, or other place, for the purpose of sale, or distribution, or exhibition for gain or on hire, and that such things have been sold, &c., may authorise a constable to enter in the daytime, and, if necessary, use force by breaking open doors, or otherwise to search for and seize such books, &c., and carry them before the magistrate or justices, who may, after giving due notice to the occupier of the house, and being satisfied as to the nature and object of keeping the articles, cause them to be destroyed.

Obscurantists ('lovers of darkness;' Lat. *obscurare*, 'to darken'), the name given to those who are supposed to look with dislike and apprehension on the progress of knowledge, especially to such as defend theological prejudices against what is believed to be scientific truth.

Observantists. See FRANCISCANS.

Observatory, an institution supplied with instruments for the regular observation of natural phenomena, whether astronomical, meteorological, or magnetical. In some observatories all three classes of observation are carried on, but in most cases special attention is paid to astronomy alone, and only such meteorological observations are taken as are required for the calculation of the effect of atmospheric refraction on the position of a heavenly body; there are, however, several observatories which are devoted solely to meteorological or magnetical observations.

The most important work which is carried out in public astronomical observatories is the determination of the movements of the sun, moon, and planets among the stars; and, as a corollary to this, the relative positions of the stars to which the other heavenly bodies are referred. In early times the Greek astronomers fixed these positions by means of Armillary Spheres (q.v.) and Astrolabes (q.v.). Ptolemy made use of a Quadrant (q.v.); and many centuries after Tycho Brahé converted this form of instrument into an Altazimuth (q.v.), with which he made a long series of observations of the altitudes and azimuths of the heavenly bodies at the observatory which the king of Denmark erected for him; and he also measured with great assiduity their angular distances from each other by means of a Sextant (q.v.). It was not till the middle of the 18th century that the improvement of the clock by Graham enabled astronomers to rely on it for the determination of right ascensions by the times of passage across the meridian by means of a quadrant. A pair of such instruments pointing respectively north and south were erected at the Royal Observatory, Greenwich, and used by Bradley and his successors from 1750 till they were displaced by the Mural Circle (q.v.). At the same time the accuracy of readings was greatly increased by the invention of the micrometer-microscope, which made it possible to measure spaces to $\frac{1}{1000000}$ of an inch. Neither the quadrant nor the mural circle, however, could be relied upon for accurate motion in the plane of the meridian, but Römer remedied this defect by inventing a separate instrument, the Transit (q.v.). With the transit and quadrant Bradley commenced that series of observations of the positions of the sun, moon, and planets, and of stars for reference, which has been continued ever since at Greenwich, and on which, in combination with less extensive series at Paris and Königsberg, all our tables of the motions of

the heavenly bodies are founded. In modern observatories the transit and mural circle are combined into one instrument, the Transit-circle (q.v.). An important auxiliary to the transit-circle is the chronograph, an American invention, which, in various forms, is now found in all well-equipped observatories, the principle in all cases being the same—viz. the registration on a revolving cylinder of paper of the times of transit across the system of spider-lines of the transit-circle, as well as of the seconds of the sidereal clock, by means of electric currents, which pass through electro-magnets when the circuit is closed either by the observer or the clock, thus causing a momentary attraction of a piece of soft iron, and producing a corresponding mark on the paper either with a pen or a steel point. This system, while improving somewhat the accuracy of the individual observations, admits of a large number being made at intervals of two or three seconds, and leaves the observer free to make several observations of zenith distance during the passage of a star across the field of view. The observations of stars at the observatories of Greenwich, Paris, Washington, and Oxford are mainly directed to the most accurate determination of the places of a limited number, and the deduction of their proper motions by comparison with the results obtained by Bradley, Piazz, and Groombridge; at other observatories differential or zone observations of large numbers of stars have been made, with the object of making a complete and tolerably accurate survey of the heavens.

A large number of observatories, chiefly in Germany and America, are devoted to a very different class of observations—viz. differential observations with the Equatorial (q.v.) of comets and small planets as referred to comparison-stars, and the search for such objects; whilst at other observatories, among which that of Pulkova may be mentioned, the measurement of double stars with the micrometer is laid down as the chief object. Of late years two new subjects have been introduced in the routine of observatory work—photography and spectroscopy. The former was carried on for many years at Kew Observatory under Mr De La Rue's auspices, and at his private observatory at Cranford, and the work is now being continued at many observatories, both public and private; the latter has been taken up at a number of Italian observatories, and particularly at Rome by P. Secchi, and it now forms part of the regular system at Greenwich; whilst the observatories at Paris, Berlin, and Vienna are equipped for these physical observations, and in America and Australia they are vigorously carried on at several observatories—Melbourne, in particular, being provided with a four-feet equatorial reflector for this purpose, as well as for the examination of nebulae. The most important work of an observatory, however, consists not in making observations which are easily multiplied, but in reducing and publishing them—a task of far greater labour, and requiring far higher qualifications. However various may be the observations, the mathematical method of eliminating their errors is the same in all cases; and it is when such treatment is required in any inquiry that it should be undertaken at a public observatory, where this rigorous method will be applied.

In addition to regular astronomical observations of all kinds, national observatories are usually charged with the distribution of time signals, and the rating of chronometers for the navy—matters of great practical importance, especially in Great Britain, where Greenwich time is communicated directly by telegraph to more than 600 towns.

There were observatories amongst ancient

Babylonians and Egyptians. Of modern observatories that at Cassel dates from 1561, Tycho Brahe's at Uranienburg from 1576; that of Greenwich (q.v.) was founded in 1675. The oldest in the United States is the Hopkins Observatory, Williams College, erected in 1836; now there are upwards of sixty, of which those of Washington and Harvard, and the Lick (q.v.) Observatory are the chief. The highest in the world is that on Mont Blanc, at a height of 14,470 feet.

Obsidian, a natural glass—the vitreous condition of an acid lava. It is hard and brittle, with remarkably vitreous lustre, and perfectly conchoidal fracture, the edges of the fractures very sharp and cutting like glass. It varies from semi-transparency to translucency only on the edges. It is often black or very dark gray; sometimes green, red, brown, striped, or spotted; and sometimes *chatoyant* or *aventurine*. Some obsidians are rendered porphyritic with microscopic crystals of sanidine; others are often highly vesicular and plentifully charged with spherulites usually arranged in the line of lava-flow. The rock is usually rich in crystallites and microlites (the 'beginnings of crystallisation'), which are frequently arranged in parallel or undulating lines = 'fluxion-structure.' Steam- or vapour-pores of minute size occur abundantly in some obsidians. Obsidian is thus a kind of lava. It is capable of being polished, but is apt to break in the process. It is made into boxes, buttons, ear-drops, and other ornamental articles; and before the uses of the metals were well known it was employed, in different parts of the world, for making arrow and spear heads, knives, &c. It is found in Iceland, the Lipari Isles, Vesuvius, Sardinia, Hungary, Spain, Tenerife, Mexico, South America, Madagascar, Siberia, &c. Black obsidian was used by the ancients for making mirrors, and for this purpose was brought to Rome from Ethiopia. It was used for the same purpose in Peru and Mexico. Mirrors of black obsidian are indeed still employed by artists. Chatoyant or aventurine obsidian is very beautiful when cut and polished, and ornaments made of it are sold at a comparatively high price.

Obstetrics (Lat. *obstetrix*, 'a midwife,' from *obsto*, 'I stand before,' thus literally 'a woman who stands before or beside another'), called also MIDWIFERY (A.S. *mid*, 'together with,' and *wif*, 'a woman'). As a branch of medical science and practice obstetrics is concerned with the study and care of women during the processes of pregnancy, parturition, and the puerperium, or lying-in. As a department of medical study it embraces the anatomy and physiology of the female organs of generation, the phenomena of conception and pregnancy, of labour, normal and abnormal, and of the puerperium and the return of the organs to their non-pregnant condition. Strictly speaking, these processes are normal and physiological, and in perfectly natural conditions require little or no skilled help or assistance. But, while theoretically this may be so, it is still the case that these processes each produce an effect on the female organism which results in great modifications of the ordinary vital functions, so that the condition is one of continued physiological tension, which at any moment may pass into a pathological or abnormal condition in which skilled assistance is of the utmost importance. There can further be no doubt that many influences at work in states of civilisation tend greatly to increase the dangers of the reproductive process, so that the members of highly civilised communities are peculiarly liable to disaster; but at the same time the rudest savages are by no means free from these risks, and the care which most of them take of their women during pregnancy

and parturition amply proves how conscious they are of this fact (but see COUVADE). The dangers with which the reproductive process is associated may be in some measure realised when it is understood that during pregnancy women are liable to be affected by many of the ordinary diseases in an aggravated form, which may give rise to premature expulsion of the ovum—abortion—a process in itself attended by grave dangers; that during parturition the child may present by some part of the body other than the head, causing increased difficulty, often impossibility of spontaneous delivery; that there may be some disproportion between the size of the child's head and the pelvis, due to disease or deformity; that from disease or exhaustion the uterus may be incapable of expelling its contents; that after the birth of the child the natural processes for checking hemorrhage from the site of the placenta may be at fault, or again the retention of a blood-clot or fragments of placenta may expose the patient to the risks of septicæmia or blood-poisoning. These are but a tithe of the dangers which surround the reproductive process, but they give an ample explanation of the existence of a science and art of obstetrics by which these and similar dangers may be obviated. With regard to parturition itself it may be noted that the great majority of labours (95 per cent.) are natural—i.e. the head presents, and they are spontaneously accomplished within twenty-four hours. But in civilised countries, and under the best practice, it is estimated that one in 120 women dies within a fortnight after labour. It would be out of place in a work of this kind to enter into the details of this science, but a sketch of the history of its origin and development may be of interest.

Until about the beginning of the 16th century the practice of obstetrics was mainly empirical. It was founded on experience and superstition, and was in great measure destitute of an anatomical or physiological foundation. Such practice is seen in the present day among uncivilised races, and we find procedures described as employed by the Egyptians, Jews, Greeks, and Romans in vogue among the North American Indians and negroes at the present time. During the empirical period we find, as we might expect, that the ordinary practice was wholly in the hands of women. At first female friends and neighbours would perform what kindly offices they could, but soon a distinct class of midwives arose, whose experiences or special aptitude fitted them for the duty. All ordinary labours were attended by them, and they did not yield up a difficult case to the surgeon or physician until they had exhausted a code of practice partly reasonable as founded on experience, partly superstitious, but often very elaborate. When these resources failed, the aid of the male practitioner, who combined the offices of priest and physician, was usually invoked. At first the aid yielded by these was largely based on superstition, consisting in charms, incantations, and invocation of special deities. Eilithyia among the Greeks and Lucina among the Romans were the chief deities presiding over childbirth, though among the Romans particularly a number of minor deities were regarded as specially available for special complications. With the growth of medical knowledge the purely religious office of the priest became detached from that of the physician, and among the Egyptians in quite early times the physician became a separate functionary and rendered much more practical aid. The ignorance of the anatomy of the organs involved greatly limited their practice, and cases of difficult or delayed labour were usually treated by Cesarean (q.v.) section, or later by some form of embryotomy.

The writings of Hippocrates (400 B.C.) contain

the earliest attempt to formulate a practice of obstetrics. While his writings on this subject show keen observation and shrewd judgment, yet his imperfect anatomical knowledge led him into grave errors. The presentation of the head was the only way by which he considered it possible that delivery could be effected, and then cephalic turning was enjoined by him in all cases where the head did not come first. When this was found to be impossible, as in many cases it must have been, embryotomy or Cæsarean section were the only alternatives. For over 300 years the teaching of Hippocrates was practically unquestioned, until the study of anatomy in Alexandria, under the Ptolemies, served to clear up many of his errors, and so advance the art. To the knowledge of anatomy gained here is due the great advance in obstetrics shown by the Greek physicians who practised in Rome about the beginning of the Christian era. Chief among these is Soranus (98-137 A.D.), who published a work 'on the diseases of women,' which shows a wonderful advance in the knowledge of the anatomy of the female organs of generation. He further showed a knowledge of obstetrics which is a long way ahead of Hippocrates. He insisted upon the safety of foot and breech presentations, and recommended and described the operation of podalic turning. He showed the importance of posture in favouring difficult labours, and gave careful instruction for the performance of various destructive operations. After Soranus came Galen (born 130 A.D.), who gave an account of obstetric art as it existed at that time, but whose anatomy was very defective as compared with that of Soranus. His teaching and opinions seem to have largely influenced the Persians, and through them the Arabs, for their practice all through the middle ages seems to have been founded on Galen. Probably about the 4th century a remarkable book was published by Moschion, *Peri tōn Gynaikēiōn Pathōn*, which is sometimes, though not quite correctly, called the first obstetric work published. It is based on Soranus, and shows a much sounder anatomical knowledge than Galen possessed. Three hundred years later Paulus Æginetus published a work on this subject which is really a compilation from previous authors, and shows no advance on Moschion. From this time until the beginning of the 16th century it may be said that obstetrics made no progress. Indeed, with the fall of the Roman empire this, like other arts and sciences, fell on evil days, and the knowledge was in great measure lost and its practice degenerated, gradually passing into the hands of the lowest and most degraded women. All trace of the earlier teaching was lost with the knowledge of the anatomical principles on which it rested; practice was regulated by the grossest superstition and ignorance, and the male practitioner was never allowed to enter a lying-in room save as a last resort. Indeed, the practice of midwifery by men was for many centuries in Europe regarded as a crime and an offence against morals, and so late as 1522 Werdt of Hamburg, who donned female attire in order to permit his attending and studying a case of labour, was detected and publicly burned at the stake. And a hundred years later a Dr Willughby, an Englishman, whose daughter was a midwife, crawled into a darkened room on his hands and knees in order to assist her at a difficult labour! Nothing could have been more deplorable than the state of obstetric practice during this period, and the suffering and mortality resulting from this condition of affairs could not be easily estimated.

The first indication of a new order of affairs is found in the training of midwives in the medical school

of Salerno about the beginning of the 16th century. Some time previously this school had inaugurated the study of anatomy, and the light shed thereby had its influence on the dark and degraded practice of obstetrics. Progress was, however, slow, and its practice still largely remained in the hands of women, to whom clung the superstition of the dark ages. Yet in the hands of anatomists like Vesalius, Fallopius, Berengarius, and surgeons such as Paré, a scientific basis was again being laid, and the knowledge of Soranus and Moschion being rediscovered. And, while all ordinary labours were managed by women, the surgeons were called in to assist when a difficulty arose. By them turning was rediscovered, and embryotomy, Cæsarean section, &c. were restored and developed on more scientific principles. By-and-by, especially in France, the practice of obstetrics by surgeons gradually gained ground, though there, and still more elsewhere, its practice by men lay under a reproach. The invention of the obstetric forceps by the Chamberlens, about the beginning of the 17th century, gave a great impulse to the art. In 1668 Mauriceau published his *Treatise*, which ran through seven editions, and was for long the standard work on the subject. It was translated into English by Hugh Chamberlen in 1672, and it seems to be about this time that men began generally to engage in the practice of midwifery: Harvey, the Chamberlens, and others took it up in England; whilst La Vallière, the mistress of Louis XIV., by employing Julian Clement, a surgeon of high eminence, in her first confinement in 1663, did much to establish the practice in France.

Since the revival of the study of anatomy and physiology the progress of scientific obstetrics has been steady and sure. The reproach under which its practice so long lay has been entirely removed, and the colleges of physicians, which at one time refused their fellowships to any one engaged in obstetric practice, now receive them on the same terms as other physicians, and all medical licensing bodies demand an adequate knowledge of its theory and practice from every candidate for their diplomas. The science and practice have been built up by a host of workers, the mere mention of whose names here space precludes. But it may be of use to indicate some of the great advances and discoveries on which the art rests.

(1) *The Rediscovery of Podalic Version or Turning*.—In 1550 Paré described this operation, whose value had been recognised and its method described in the 1st century by Soranus. This had been lost to practice since the 7th century. Paré showed how it could be performed, and pointed out its advantages in saving fetal life; and it is certain many children were delivered safely by this means whose lives could not have been otherwise saved. The operation has been extended and modified in various ways since, but that described by Paré is at the present day the one most usually performed.

(2) *The Invention of the Forceps*.—About the end of the 16th or beginning of the 17th century, the forceps was invented by Dr Peter Chamberlen, a son of a William Chamberlen, a Huguenot refugee, living in England (see FORCEPS). The secret, long kept, ultimately leaked out, and by 1747 the instrument was generally known and employed. The original instrument was modified by Levret of Paris, Smellie and Simpson in Great Britain; and, more recently, its construction has been elaborated by Tarnier of Paris on what is called the 'axis-traction' principle. It may safely be said that no single invention has been more successful in saving life and relieving suffering.

(3) *The Employment of Anæsthetics*.—In 1847 Sir James Simpson first employed chloroform anæsthesia to relieve the pain of labour, and this

certainly marks one of the most beneficent advances in the history of obstetrics—probably the greatest since the invention of the forceps. Besides relieving and abolishing untold suffering in ordinary labour, it permits the performance of many operations and the correction of untoward conditions which previously were impossible or irremediable. It should be added that Hypnotism (q.v.) has within recent years been employed on the Continent for the same purpose.

(4) *The Employment of Antiseptics and the Prevention of Puerperal Fever.*—Till 1870 the great scourge of maternity hospitals, and also a frequent cause of disaster in private practice, was the prevalence of outbreaks of puerperal fever or septicæmia. In that year the teaching of Lister began to influence obstetric practice, and since then rigorous antiseptics are the rule in all maternity hospitals. Thus a mortality reaching in many instances to 6 per cent. of all cases has been reduced almost to zero, and this opprobrium of obstetric practice has been removed.

The teaching of midwifery is provided for in the curricula of all the medical schools of the United Kingdom. In most a three months' course of lectures with attendance on a certain number of cases is demanded of each student. The Scottish universities require attendance on a six months' course of 100 lectures, besides practical training by the bedside. As has been said, the licensing bodies demand an adequate knowledge of midwifery from every candidate for a license to practise; and further, at every maternity hospital the training of nurses by lectures and demonstration is regularly carried on. The ignorant midwife of the past is thus being replaced by trained women, who are competent to undertake the management of all ordinary cases of labour. There is, however, considerable room for improvement in the training and certification of these midwives. In recent years, in Great Britain and elsewhere, the facilities offered to women to obtain a full medical training are being greatly increased, and it is not unlikely that in course of time a very large part of the practice in this department, at the present undertaken by men, may be transferred to women. And that properly educated women are capable of undertaking all the responsibilities of this department of practice is shown by such cases as those of Mesdames Boivin and Lachapelle, who (in the words of Velpeau), 'although the pupils of Baudelocque, were not afraid to shake off, to a certain extent, the yoke of his scientific authority, and whose high position and dignity form the starting-point of a new era for the science of obstetrics in Paris.'

See amongst English works on the subject those of Playfair and Barnes; American, those of Lusk and Parvin, and the *American System of Obstetrics*; the French treatise by Tarnier and Budin; and German works by Schroeder, Spiegelberg, and Winckel (all of which have been translated). See also articles in this work on ABORTION, CÆSAREAN OPERATION, FETUS, FORCEPS, PREGNANCY, &c.

Ocarina, a recent Italian toy-instrument of flute-like sound, made of pottery, and shaped like the body of a bird (without head or neck).

Occam, WILLIAM. See OCKHAM.

Occasionalism. See DESCARTES.

Occleve, THOMAS. See HOCCLVE.

Occlusion, a term applied to the solution of a gas by a melted solid—as of oxygen by melted silver—which gas is given up by the melted material when it solidifies, so that in the case of silver the metal sometimes 'spits' or gives off the gas in bubbles, thereby roughening its otherwise smooth surface. Sometimes the gas is absorbed or 'occluded' (in a wider sense) even though the

metal be not fused—e.g. hydrogen gas by cold palladium, carbonic oxide by red-hot cast-iron.

Occultations (Lat. *occultatio*, 'a concealment') are neither more nor less than 'eclipses'; but the latter term is confined by usage to the obscuration of the sun by the moon, and of the moon by the earth's shadow, while the former is restricted to the eclipses of stars or planets by the moon. Occultations are phenomena of frequent occurrence; they are confined to a belt of the heavens about $10^{\circ} 17\frac{1}{2}'$ wide, situated parallel to and on both sides of the equinoctial, and extending to equal distances north and south of it, being the belt within which the moon's orbit lies. These phenomena serve as data for the measurement of the moon's parallax; and they are also occasionally employed in the calculation of longitudes.

Occultism. See MAGIC, ALCHEMY, ASTROLOGY, THEOSOPHY.

Ocean, generally the body of salt water that separates continent from continent, embracing altogether about three-fifths of the whole surface of the earth. The separate oceans are the Atlantic, separating America from Europe and Africa; the Pacific, between America and Asia; the Indian, lying south of Asia, and limited on the east and west by Australasia and South Africa; the Arctic, surrounding the north pole; and the Antarctic, surrounding the south pole. There are articles on the several oceans, and the physical features and characteristics of the ocean will be described under SEA.

Oceania, a name sometimes given to the fifth division of the globe, comprising all the islands which intervene between the south-eastern shores of the continent of Asia and the western shores of America. It naturally divides itself into three great sections—the Malay Archipelago, Australasia or Melanesia, and Polynesia (q.v.).

Ocelot (*Felis pardalis*) is a species, with several varieties, which is confined to the New World, and ranges from Arkansas in the north to Patagonia. These animals are inhabitants of forests, and very expert in climbing trees. Their prey consists in great part of birds. They are beautifully marked and coloured. The coloration varies

Ocelot (*Felis pardalis*).

considerably, but the ground tint is always a rich red or tawny colour, blending finely with the dark brown on the margins of the open spots, of which there are chains along the sides; the head, neck, and legs being also variously spotted or barred with dark brown or black.

Ochil Hills, a pastoral range occupying parts of the Scottish counties of Stirling, Perth, and Clackmannan, and extending from the vicinity of Stirling north-east to the Firth of Tay. It is 24 miles in length, and about 12 in breadth. Chief summits are Benclough (2363 feet), Dunmyat (1375), and King's Seat (2111). The hills, which are formed chiefly of greenstone and basalt, contain silver, copper, and iron ores. See Beveridge's *Between the Ochils and the Forth* (1888).

Ochino, BERNARDINO, Italian reformer, was born at Siena in 1487, and joined the Franciscan Observants, but in 1534 changed to the Capuchin order, as being more strict. In four years' time he was vicar-general of the order, having already before joining it gained the reputation of a man of great piety and eloquence. In 1542 he was summoned to Rome to answer to the Inquisition for certain evangelical tendencies which had been manifested in sermons delivered by him at Venice three years before, and had been much talked about. Warned by Cardinal Contarini, Ochino turned back at Bologna and fled to Geneva, where Calvin gave him a welcoming hand. In December 1545 he was appointed preacher to the Italian congregation in Augsburg, but fourteen months later was driven from the city by the advent of the imperial troops. From this time Ochino was dogged by misfortune, and was never able to stay long in any one place. He first found refuge in England, invited there by Cranmer; he was made pastor to the Italian exiles and given a prebend in Canterbury Cathedral. In England he wrote the *Tragedy*, a series of dramatic dialogues translated from the original Latin into English by Bishop Ponet, which is believed to have had some influence upon Milton's *Paradise Lost*. At Mary's accession (1553) Ochino fled to Switzerland, and ministered to the Italian exiles in Zurich for ten years. Then the publication of *Thirty Dialogues*, one of which the Calvinists stated to contain a defence of polygamy, occasioned his being banished precipitately from the canton. In the dialogue in question Ochino states expressly and repeatedly that 'polygamy is immoral;' but, being a man of inquiring, questioning intellect, he at the same time threw out the suggestion that there might be individual cases in which it might perhaps be permissible, provided the individual were quite certain he had God's approval. Ochino fled to Poland, but was soon driven thence by an edict directed against all foreigners, and died in flight at Schlackau in Moravia in the end of 1564. See *Life* by Benrath (Eng. trans. by Helen Zimmern, 1876).

Ochres are native pigments consisting of clays or earths composed chiefly of silica and alumina, along with oxide of iron or more rarely with other oxides. Some are found in a natural state fine enough to be used after being simply washed. The two important classes of ochres are the yellow and the red, the colouring material of the former being the hydrated oxide of iron, and that of the latter the red or sesquioxide. Umber (q.v.), which is classed with the ochres, contains manganese as well as oxide of iron. Yellow ochres are reddened by being burned. Most of the ochres can be prepared artificially, but these are not so safe for artists' purposes as the native earths. The latter are remarkable for their stability, as can be seen in many pictures by the old masters. Yellow ochre and Roman ochre are much used both by artists and house-painters, and so also (but the first more by artists) are the red ochres, known as light red, Indian red, and Venetian red. This last, however, is an artificial product, and, although it is an oxide of iron colour, it contains no earthy base, so that correctly speaking it is not an ochre. Ochre is found in several English counties, but it is most largely worked in Anglesey and Devonshire. About 12,000 tons are raised in some years, the value of which is roundly £2 per ton. It occurs in many other countries, there being large deposits of it in Canada. The earthy or powdery varieties of some of the less common metallic compounds found native are called ochres by mineralogists. Among these there are bismuth ochre, antimony ochre, nickel ochre, and chrome ochre.

Ochterlony, SIR DAVID, British general, was born of Scottish (Forfarshire) descent, at Boston, Massachusetts, on 12th February 1758, went out to India as a cadet at eighteen, and was made lieutenant-colonel in 1803. In the following year he defended Delhi against Holkar; but his greatest services were rendered against the Goorkhas. In 1814 he stormed their hill-forts one after the other, and compelled them to sue for peace; on the renewal of the war in 1815 he shut up their principal chief in the hill-fort of Malaun, forced it to surrender, and penetrated to within a few miles of the Nepalese capital. Peace was again made; and the treaty has remained in force down to the present time. Ochterlony was made (1816) a baronet for his success. He rendered excellent service in the Pindari and Mahratta wars of 1817 and 1818. He died at Meerut, 15th July 1825.

Ockham (more usually in the Latinised form OCCAM), WILLIAM OF, surnamed *Doctor Singularis et Invincibilis*, a famous 14th-century schoolman, was born in England, at Ockham in Surrey, but when is not known; the date usually given is 1370 or 1380. He entered the Franciscan order, and studied at Oxford and Paris, being a pupil, afterwards the rival, of Duns Scotus. It seems not to be correct that he took part in the contest between Philip the Fair of France and Boniface VIII., the famous *Disputatio super Potestate Prælati Ecclesiæ . . . commissæ*, usually attributed to him, having been probably written by another. But in the revolt of the Franciscans against Pope John XXII. at Perugia in 1322 he did take part, being one of the most active in the movement. After four months' imprisonment at Avignon he repaired to Munich, and found there a defender in the Emperor Louis of Bavaria, whom he in his turn defended stoutly against the temporal pretensions of the pope. In 1342 he seems to have become general of the Franciscans. Besides insisting on the independent divine right of temporal rulers, and so in some measure clearing the way for modern constitutional ideas, Ockham won greater fame as the reviver of Nominalism (q.v.), for which he won a final victory over the rival Realism, chiefly by setting forth its real meaning in plain and simple language. He seems to have died at Munich in 1349. His views on civil government are expounded in *Super Potestate Summi Pontificis octo Questionum Decisiones* (1339-42) and *Tractatus de Jurisdictione Imperatoris in Causis Matrimonialibus*, his philosophical views in *Summa Logice* (1488) and the commentary on the *Sentences* of Peter the Lombard, and his theological in this last and the *Tractatus de Sacramento Altaris* (1516). See T. M. Lindsay in *Brit. Quart. Review* (1872).

Ockley, SIMON (1678-1720), Orientalist, was educated at Oxford, and in 1711 became Arabic professor. His *History of the Saracens* (2 vols. 1706-18; long a standard, though not based on the best authorities) was partly written in a debtor's prison.

O'Connell, DANIEL, 'the Liberator,' greatest of Irish patriots and orators, was born near Cahirciveen in County Kerry, August 6, 1775. He was the eldest son of Morgan O'Connell, brother of the childless Maurice O'Connell, then head of an old Catholic family, whose chief seat was Darrynane Abbey. He was early adopted by his uncle, at whose house most of his boyhood was spent. He was placed, together with his brother, in January 1791 at the college of St Omer, the president of which, Dr Stapylton, foresaw his unusual promise. In August 1792 they went to the college at Douay, which was suppressed at the end of the year, and it was not without danger that the boys made their escape by Calais to England. To the end of his life O'Connell never forgot his glimpse of dominant

revolution. He entered at Lincoln's Inn in 1794, worked hard, and was called to the Irish bar in May 1798. He was soon drawn, like most eager young Irishmen, into political agitation, and it appears probable that he had some connection with the conspiracy of 1798, the unhappy issue of which cured him for life of all love for secret societies. At the same time the scandalous scenes at state trials, the degraded condition of his co-religionists, and the shameful circumstances attending the Union already shaped for him the politics of his life. The average professional earnings of his first four years were only £180, but thereafter these rose rapidly. In 1802 he married his cousin, Mary O'Connell, who bore him five sons and three daughters, and with whom he lived till her death in 1836 in uninterrupted happiness. He joined the Munster circuit, and went on it for twenty-two years. He soon became famous as a counsel, as well as an unrivalled cross-examiner of Irish witnesses, and ere long was plunged in an enormous practice, amid which he yet contrived to find time for the convivialities of that day and for a large measure of political agitation. The wide popularity of 'the Counsellor'—to the last a favourite title among his Irish admirers—was due to his fearlessness and professional dexterity, his boisterous wit and good-humour, his constant tact and readiness in reply, and not less to the violent language he often employed in court, which he defended in later days as a necessary means to awaken the slumbering spirit and self-respect of Catholics. Their hopes, which had been raised by the pledges given at the Union, soon sank low, and O'Connell now flung himself into the agitation for their rights, quickly distanced Keogh and other timid leaders of the party, and by the beginning of 1811 stood out as its virtual chief.

Grattan's motion in favour of emancipation was carried in March 1813, but his bill was lost in committee. The 'securities' it proposed were most distasteful to the Catholic bishops, and O'Connell, ever a devoted churchman, supported them in their policy in opposition to Grattan. The timid counsels of the pope, then a pensioned prisoner of Napoleon, were displeasing to the Catholic party, but it was O'Connell's own conscientious convictions that nothing short of repeal would be permanently satisfactory that made him fight resolutely against all compromise. His attacks on the 'beggarly corporation' of Dublin, then an Orange stronghold, brought him a challenge from Mr J. N. D'Esterre, and in the duel that ensued his pistol unfortunately inflicted a fatal wound on his antagonist, February 1, 1815. O'Connell was filled with lifelong remorse; he settled a pension on the widow, and never till his latest day passed the dead man's house without uncovering his head and breathing a prayer. At the same time he registered a solemn vow never to go out again. His fiery invectives brought him in the course of his lifetime many challenges, but only once did he allow himself to accept another—from Peel in the September of 1815. The duel was only prevented by his being arrested on his wife's information and bound over to keep the peace. Meantime the Catholic cause languished; Grattan died in 1820, and Plunket took up his mantle, but again the Lords threw out the bill. The visit of George IV. to Ireland in August 1821 raised hopes only to be nipped in the bud, while famine and commercial insecurity paralysed the public confidence. In 1823, at the moment of deepest gloom, O'Connell formed on a broad and popular basis the Catholic Association, and before the end of the year had brought the priests into it. At first they showed much disinclination to join in the agitation, preferring the old policy of 'dignified silence'; but, once

they entered heartily into it, the movement became for the first time really national and irresistible. The Association was a gigantic system of organisation, perfectly new to Ireland, and aroused the greatest enthusiasm from sea to sea. By the 'Catholic Rent' a large sum of money was raised for its purposes, a penny a month not being too little as a test of membership. By the end of 1824 it had grown to a formidable power, the average weekly rent for its last three months being as much as £500. The government in alarm brought in a bill to suppress the Association, but it dissolved itself, March 18, 1825. The Irish forty-shilling freeholders now began to find courage to oppose their landlords at the elections. Waterford was carried in 1826, and O'Connell himself stood for Clare in 1828, and was carried amid enormous enthusiasm, yet perfect order. The Clare election set the whole country aflame; the lord-lieutenant, Lord Anglesey, foreboded insurrection, and even the Iron Duke was appalled at the prospect; but O'Connell saw that an outbreak would ruin the Catholic cause on the very eve of its triumph, and with magical effect ended the agitation. In 1829 the measure of relief passed at last, admitting Catholics to parliament, repealing the oath of abjuration, and modifying that of supremacy, the 'securities' being the abolition of the forty-shilling franchise and raising the qualification to £10. On the 15th May 1829 O'Connell came to take his seat, and was heard at the bar as to his right to escape the old oaths. He spoke calmly and admirably, but the House refused his claim by 190 to 46. He went down to Clare like a conqueror, was returned unopposed, and took his seat at the beginning of 1830, then fifty-five years old. At the new election on the king's death he was returned for Waterford.

Much of the good effect of 1829 was lost by the unnecessary insult to a sensitive people of not allowing its champion to take his seat without re-election, still more by the fact that no Catholics were appointed to the bench, and by the placing in the hands of the lord-lieutenant the power to suppress arbitrarily by proclamation any assembly that seemed to him dangerous. O'Connell now formed a new society for Repeal, 'The Friends of Ireland of all Religious Persuasions,' which was quickly suppressed, only to be revived as often as suppressed by a succession of others under new names and forms so as to elude the letter of the law. He denounced the ministry of Wellington and Peel, and tried in 1830 to embarrass them by an unjustifiable letter recommending a run upon gold. In the face of the threatened prosecution against him in 1831 he temporised and so saved himself. In the same year he became King's Counsel, the honour having been kept back as long as possible. It was at this period that he declined the challenge of Hardinge, the chief-secretary. Liberal in every part of his imperial policy, during the Reform struggle he supported the Whigs, as later he advocated free trade in corn, negro emancipation, the removal of the disabilities of the Jews, the cause of Poland, not to speak of universal suffrage, and the drastic reformation of the House of Lords. In the autumn of 1830 the potato crop had been very poor, and much misery was the result in Ireland. Under O'Connell's advice the people declined to pay tithes, and that winter disorder was rampant everywhere.

He had sat last for Kerry, when at the general election of 1832 he was returned for Dublin. At this time he nominated about half of the candidates returned, while three of his sons and two of his sons-in-law composed his 'household brigade.' Of the 105 Irish members but 23 were Tories; while of the 82 Liberals as many as 45—his famous 'tail'—were declared Repealers. The severest of all

coercion acts hitherto in force was that of 1833, against which O'Connell fought in the House of Commons with masterly courage and ability. The disgraceful interruptions and outrageous insults of his opponents somewhat excuse the violence of his tone and the vulgarity of such phrases as 'beastly bellowings,' till then, if not since, unfamiliar to the ears of the House of Commons. Soon after this he was forced against his better judgment by Feargus O'Connor, the *Freeman's Journal*, and his more ardent followers to bring the Repeal movement prematurely into parliament. On April 22, 1834, he spoke nearly seven hours for a committee to inquire into the Act of Union. The debate lasted nine nights, and the motion was defeated by 523 to 38. The Whigs under Lord Melbourne came into power in 1835, and, Repeal being for the time set aside as hopeless, O'Connell would have accepted office had not the king intervened to forbid it, and certainly for the next five years he gave the Whigs a steady support. His phrase 'a bloated buffoon,' applied to Lord Alvanley, brought a challenge which was refused, but his son Morgan went out in his stead, and two shots were fired. D'Israeli, who had solicited O'Connell's help in his canvass for High Wycombe in 1832, now attacked him fiercely at the Taunton election in 1835. In a speech at Dublin O'Connell retorted by calling him 'a miscreant,' 'a liar,' 'a disgrace to his species,' and 'heir-at-law of the blasphemous thief who died upon the cross.' D'Israeli now sought to earn a cheap reputation as a fire-eater by challenging Morgan O'Connell in his father's stead, but the challenge was declined. That year O'Connell visited the north of England and Scotland, received everywhere by enormous crowds full of curiosity and interest. An incident in the Carlow election of 1835 brought upon him from unscrupulous and watchful enemies the charge of having pocketed money to procure a man a seat, but the inquiry only brought out that he was grossly careless in managing affairs, and left no real stigma on his character. One of the most common Tory slanders upon him was that Repeal was not so much the object of 'the big Beggarman' as the Repeal rent; but it must be remembered that to serve his country he surrendered a very lucrative practice at the bar (worth £7000 a year, as he told the House of Commons) and all hope of professional promotion, that though as much as £10,000 of tribute flowed yearly into his hands he expended it faithfully in the cause, and, in spite of the large fortune bequeathed by his uncle in 1825 and a subscription of £50,000 in 1829, died worth scarcely a thousand pounds. The vast hospitality he exercised was a necessity of his position, and, if it is true that he brought his own sons into parliament, it cannot be said that he ever set aside a really good candidate in their favour. Ireland trusted him, and to the end he justified her trust.

Mulgrave and Drummond governed Ireland so mildly and impartially that O'Connell was prepared to abandon the Repeal agitation in the prospect of at last obtaining justice for his country. In 1836 he was unseated on petition for Dublin—his expenses in defending were £20,000; those of the petitioners, £40,000. He was now returned for Kilkenny, nearly £8500 being at once raised for his expenses. He had loyally supported the Whigs at the risk of waning popularity in Ireland, but he began to feel misgivings as he saw his dreams of justice to Ireland vanishing into a more and more distant future. In the November of 1837 he denounced the men in a Dublin strike and was hooted at in the streets, and on 28th February 1838 he was severely reprimanded by the Speaker for attributing perjury to the Tory committees in the House of Commons. That same year the Mastership of the Rolls was

offered him but declined. In August he founded his 'Precursor Society,' and on April 15, 1840, his famous Repeal Association, the members of which were grouped in three classes—volunteers who subscribed or collected £10 a year, members who subscribed £1, and associates who subscribed one shilling. That summer and autumn he addressed meetings incessantly, but yet the agitation languished till the appearance of the *Nation* in October 1842 brought him the aid of Dillon, Duffy, Davis, Mangan, and Daunt. In 1841 O'Connell lost his seat at Dublin, but found another at Cork, and in November he was elected Lord Mayor of Dublin. On February 25, 1843 he brought up the question of Repeal in the Dublin corporation in a splendid oration of four hours' length, and carried it against Isaac Butt by 41 to 15. The agitation now leaped into prominence, and the priests came pouring in to swell its strength. That year's rent was £48,400; Conciliation Hall was built in Dublin, and a magnificent and perfect organisation arranged with great enthusiasm and perfect harmony. Even a Repeal police was instituted under a Head Pacificator. Arbitration courts were formed, and a great mass of national literature disseminated. O'Connell travelled that same year 5000 miles. Monster meetings, attended by hundreds of thousands, were held in every corner of Ireland, yet these were never mobs—nowhere was there crime or even drunkenness, thanks to Father Mathew. The greatest was that held on the Hill of Tara, 15th August 1843, the attendance at which was estimated by the *Nation* at three-quarters of a million. O'Connell had an innate horror of rebellion and bloodshed—'he who commits a crime adds strength to the enemy' was a favourite motto; another, 'no political change whatsoever is worth the shedding of a single drop of human blood.' Throughout a whole generation with wonderful skill he had kept the public mind at a pitch of the highest political excitement, yet restrained it from unconstitutional action, although he often skated dangerously near the edge of inflammatory language. But now the Young Ireland party, with all the infallibility of youth and enthusiasm, began to grow impatient of the old chief's tactics, and, impelled by their enthusiasm and certain of the speedy surrender of the government, O'Connell allowed himself in his speeches to outrun his better judgment. But this time Wellington was resolute in his measures, and poured 35,000 men into Ireland. A great meeting was fixed at Clontarf for Sunday, October 5, 1843, but it was proclaimed the day before. O'Connell, apprehensive of a bloody scene, issued a counter-proclamation abandoning the meeting. Early in 1844 he was tried with his son and five of his chief supporters for a conspiracy to raise sedition, and after a trial extending over twenty-three days was found guilty, and ultimately on May 30 sentenced to twelve months' imprisonment, a fine of £2000, and £5000 security for good behaviour for seven years. The House of Lords set aside the verdict as erroneous on September 4, and at once bonfires blazed across Ireland from sea to sea. But during the fourteen weeks the Tribune lay in prison the disease seized him of which three years later he was to die. And he found that in his absence the Young Ireland party had taken a forward step, and that his moral force policy was now discredited by the more fiery young spirits of his party, who began to talk in articles and songs of the lawfulness of physical resistance to the government. His proposed scheme of federation and local parliaments found no favour, and he withdrew it, alleging that it was merely a ruse to gauge the Whig feeling of Ulster. He opposed Peel's provincial 'godless colleges,' and soon came an open split between him and Young Ireland, the members

of which seceded from the Association after angry disputes in 1846. Next followed the potato famine. Distraction at the sufferings of his country, dismay at the stalking shadow of famine, vexation at the breach in his party, consciousness of failure in the dearest project of his life, religious austerities in expiation of the errors of his youth, the progress of insidious disease, and last of all a crazy passion for a young English girl, now combined to break down his herculean frame. He left Ireland for the last time on 26th January 1847, made a touching but scarce audible speech in the House of Commons on February 8, next went to Hastings and to Folkestone, and as he felt the hand of death upon him was filled with a great longing to reach Rome. Boulogne, Paris, Moulins, Lyons, Marseilles, and Genoa were the slow stages of the journey. At the last, after some days of delirium, he died, May 15, 1847. His heart by his own desire was carried to Rome, and buried in the church of St Agatha; his body rests in the Glasnevin Cemetery, Dublin, in a crypt at the base of an Irish round tower, 165 feet high.

Daniel O'Connell was framed by nature for the part he had to play in life. Almost six feet high, of burly figure, giant strength, inexhaustible energy, and enormous powers of work, he had a splendid command of nervous language, and a mighty voice that rose high above the uproar of the crowd. A magnificent orator, trenchant, versatile, self-possessed, sincere with all his exaggeration, ready in unstudied and effective retort, richly endowed with a coarse but genuine humour, and ever thoroughly Irish, he controlled at will the wildest emotions of an Irish mob, and passed with the ease of a master from bursts of passion and outrageous buffoonery to the tenderest pathos. He was master of all the artillery of vituperation, but it should be remembered in his defence that he was assailed all his life, the constant victim of a malignity and hatred now difficult to realise. Even the *Times* newspaper stigmatised him as 'an unredeemed and unredeemable scoundrel,' and asked, like Cicero of another Catiline, 'How long shall such a wretch be tolerated among civilised men?' Yet O'Connell was no demagogue in the unworthy sense of that word, no socialist or advocate of strikes—he opposed the poor-laws of 1838 on the most unpopular grounds, and rejected the proffered alliance of the Chartists, constantly denounced rebellion, and was unwavering in personal loyalty to the sovereign. He was no mere tool of Rome, and never abused Protestants as such, but advocated a large tolerance in religion far beyond the ideas of either his antagonists or his supporters, making for his aim a really Liberal Catholicism that earned the unstinted approbation of Montalembert and Lacordaire. His church policy was carried out far beyond his dreams in 1869, his fixity of tenure granted by the Land Bill of 1870; and indeed the magnitude of the measures the imperial parliament has since his time adopted to heal the distresses of Ireland but shows how sound was his statesmanship and how real were the evils that he denounced. Yet together with all this good there was mixed much evil also. He was coarse, scurrilous, cunning, violent, bombastic, unscrupulous, more than Celtic in his looseness of phrase and exaggeration, he often played upon unworthy passions, and left behind him an inheritance of antagonism between classes in Ireland that has done much to degrade and embitter the tone of public life. But it should never be forgotten that he taught his country to manage within constitutional limits the whole machinery of political agitation, and again aroused within her the spirit of nationality and the instinct of freedom. He said himself with justifiable pride, 'Grattan sat by the cradle of his country, and followed her

hearse: it was left for me to sound the resurrection trumpet, and to show that she was not dead, but sleeping.' With all his faults he was a great and sincere patriot, whose devotion to the best interests of Ireland will never fade from her remembrance.

Of O'Connell's published writings the most characteristic is the *Letter to the Earl of Shrewsbury* (1842). His *Memoir of Ireland, Native and Saxon* (1843), never saw its second volume, and is poor and inaccurate. There is no adequate biography, though there are *Lives* by his son John O'Connell (1846), William Fagan (1847-48), M. F. Cusack (1872), and a short Centenary Life by the Rev. John O'Rourke (1875). See W. J. O'Neill Daunt's *Personal Recollections* (2 vols. 1843); his son's *Recollections and Experiences during a Parliamentary Career from 1833 to 1848* (2 vols. 1849); W. E. H. Lecky's *Leaders of Public Opinion in Ireland*, unquestionably the ablest estimate of his character (new ed. 1871); M. F. Cusack's *Speeches and Public Letters of the Liberator* (2 vols. 1875); Shaw Lefevre's *Peel and O'Connell* (1887); the excellent study by J. A. Hamilton in the 'Statesmen' series (1888); and W. J. Fitzpatrick's authoritative and invaluable *Correspondence of Daniel O'Connell, the Liberator* (2 vols. 1888). The delightful letters to his wife and Archbishop M'Hale, contained in the last, gave a new revelation into his character. Good articles on O'Connell are those by J. Ball in *Macmillan's Magazine* for July 1873, and Mr Gladstone in the *Nineteenth Century* for January 1889.

O'Connor, FEARGUS EDWARD, Chartist, was born in 1796, and was educated at Portarlinton and Trinity College, Dublin. He was called to the Irish bar, and entered parliament for Cork in 1832. At first a supporter of O'Connell, he became estranged from his leader, and devoted himself to the cause of the working-classes in England. His great stature and strength, his eloquence and enthusiasm, gave him vast popularity as a leader, and by his paper, the *Northern Star*, he did much to advance the cause of Chartism. Elected for Nottingham in 1847, he presented the monster petition in the April of the following year. In 1852 he was found to be hopelessly insane, and in 1855 he died.

Oconto, capital of Oconto county, Wisconsin, on Green Bay, at the mouth of the Oconto River, 149 miles by rail N. of Milwaukee. It has large steam sawmills, and exports pine lumber. Pop. (1885) 4880; (1890) 5221.

Octave (Lat. *octavus*, 'eighth'), in the church calendar, is the eighth day after a festival, counting in the festival day itself; also, the week after a church festival.—In Music octave is the interval between any musical note and its most perfect concord, which is double its pitch, and occupies the position of the eighth note from it on the diatonic scale. The name octave is often given to the eighth note itself as well as to the interval.

Octavia, the sister of the Roman emperor Augustus, and wife of Mark Antony, distinguished for her beauty, her noble disposition, and womanly virtues. On the death of her first husband, Marcellus, she consented in 40 B.C. to marry Antony, to make secure the reconciliation between him and her brother; but in a few years Antony forsook her for Cleopatra. In 32 B.C. war, long inevitable, broke out between Antony and Octavian; and the former crowned his insults by sending Octavia a bill of divorce. But no injury was too great to be forgiven by this patient Griselda of the ancient world; and after her husband's death she brought up with maternal care not only her own children by Antony, but also those of Cleopatra. She died 11 B.C.

Octavian. See AUGUSTUS.

October (Lat. *octo*, 'eight') was the eighth month of the so-called year of Romulus, but became the tenth when Numa changed the commencement

of the year to the first of January, though it retained its original name, notwithstanding the attempts made by the Roman senate, and the emperors Commodus and Domitian, who substituted for a time the terms *Faustinus*, *Invictus*, *Domitianus*. Many Roman and Greek festivals fell to be celebrated in this month, the most remarkable of which was the sacrifice at Rome of the October horse to the god Mars.

Octopus, a widely distributed genus of eight-armed cuttle-fishes, the members of which (e.g. *O. vulgaris* in Europe, and *O. bairdii* in America) usually live near shore, lurking among the rocks, preying upon crustaceans and molluscs. The term is often extended to related genera, such as *Eledone*, and to other members of the sub-order Octopoda. These differ in many ways from the Decapoda, such as *Sepia* and *Loligo*: thus, the suckers on the eight arms are sessile and without a horny ring; the body is more rounded, and there is no internal residue of a shell. Of the half-hundred species some are large: thus, *O. vulgaris* may have tentacles about 8 feet long, and *O. punctatus* of the Pacific coasts even twice as much. These are dwarfed, however, by the gigantic ten-armed *Architeuthis*, of which one specimen exhibited in America had a head and body $9\frac{1}{2}$ feet long and arms of 30 feet, while another had a body twice as big.

Common Octopus (*Octopus vulgaris*).

Many fanciful descriptions have been given of the Octopus, notably that by Victor Hugo in his *Toilers of the Sea*, in which the characters of cephalopod and polyp are dramatically combined. Large specimens may of course act powerfully on the defensive, but by nature they are timid, lurking animals, the conger eel and other voracious fishes being their most formidable foes. They are sometimes caught in sunken pots, into which they creep, and the flesh is used both as food and bait. The predominant colour is reddish, but it changes rapidly with that of the surroundings and with the temper of the animal, which has also the power of discolouring the water by a discharge of inky fluid. The eggs are enclosed in small translucent sacs, and hundreds are attached to a common stalk which is glued to the rock, and protected and kept free of small seaweeds, &c., by the female. For their general structure, see CEPHALOPODA, CALAMARY, and CUTTLE-FISH.

Octroi (Lat. *auctoritas*, 'authority'), a term which originally meant any ordinance authorised

by the sovereign, and thence came to be restrictively applied to a toll or tax in kind levied from a very early period in France and other countries of northern Europe on articles of food which passed the barrier or entrance of a town. The octroi was abolished in France at the Revolution, but in 1798 it was re-established. The octroi officers are entitled to search all carriages and individuals entering the gates of a town. Similar taxes are raised in Italy and elsewhere.

O'Curry, EUGENE (1796–1862), Irish antiquary. See IRELAND, Vol. VI. p. 209.

Od, the name given by Baron Reichenbach (q.v.) to a peculiar physical force which he thought he had discovered, intermediate between electricity, magnetism, warmth, and light. This force, according to him, pervades all nature, and manifests itself as a flickering flame or luminous appearance at the poles of magnets, at the poles of crystals, and wherever chemical action is going on. All motion generates od; and all the phenomena of mesmerism are ascribed to the workings of this od-force. See Buchner, *Das Od* (1854); Fechner, *Erinnerungen an die letzten Tage des Odlehre* (1876); and the *Transactions of the Psychical Research Soc.* (1883).

Ode (Gr. *ōdē*, from *aeidō*, 'I sing'), a form of lyrical poetry associated in its supreme form with the name of Pindar, but practised with splendid success by many English poets. The Greek ode was simply a chant or poem arranged to be sung to an instrumental accompaniment, and all the variations of form that occurred were merely subjective, incapable of imitation, and conditioned only by the exigencies of the music. Archilochus was the first to expand the simple distich into an *epode*; Alcman, to adopt the more complex form of the *carmen* or ode. Sappho, Alceus, and Anacreon carried it further, and shaped the lighter form of ode known to us, through the masterpieces of their greatest imitator, as the Horatian. Stesichorus modified the ode of Alcman by elaborating a triple movement, in which the metrical wave moving in the *strophe* was answered by the counter-wave moving in the *antistrophe*, the whole concluded by the *epode*, a blended echo of the two. Simonides adapted this elaborate form to Dorian music, and next followed Pindar, the greatest master of the ode. His *Parthenia* or odes for virgins, his *Skolia* or dithyrambic odes in praise of Dionysus, and his encomiastic odes have all perished; only his *Epinikia*, or triumphal odes, remain. These display an infinite variety of metrical ingenuity; no two odes have the same metrical structure, yet each obeys a definite structural law, and license there is none in its irregularity. The Humanist poets imitated the simpler *Ætolian* measures as they found them in Catullus and Horace; but many of our poets, taking Pindaric as synonymous with irregular, produced so-called odes whose only likeness to their great original was their 'unshackled numbers.' But irregularity in verse is not allowable except in cases where it is a natural aid grasped by the poetic mood in its moment of exaltation; for the most constant charm of poetry is the inevitableness of cadence, which must never be lightly flung away unless to subserve another and still higher law—that of emotional necessity. It is only in the hands of a master that the ode may safely be imitated in English; by all others the apparent artifice of the form and the necessary spontaneity of the impulse may not be reconciled.

Ben Jonson's odes are unequal; Herrick's, poor; Spenser's *Epithalamium*, or marriage ode, is one of the most splendid triumphs of English poetry; and

Milton, in his magnificent poem, *On the Morning of Christ's Nativity*, found in this a form adequate for that poetic exaltation which was his habitual mood. Cowley was already an expert in the Horatian ode, when he fell in with Pindar, and imitated him, in externals at least, in a number of elaborate compositions, usually redeemed from dullness by bursts of undoubted poetic power. Dryden has left at least three immortal odes, *To Mistress Anne Killigrew*, *For St Cecilia's Day*, and *Alexander's Feast*; and Congreve wrote not only a few admirable, if formal, examples, but an excellent critical *Discourse on the Pindarique Ode* (1705). The matchless Orinda, Lord Orrery, Ambrose Philips, Young, Akenside, and Shadwell followed after their kind; and Gray, first drawn to this form by Gilbert West, translator of Pindar, produced in 1754 and 1756 his two inimitable Pindaric odes, the *Progress of Poesy* and *The Bard*. The exquisitely poetic, though not Pindaric, odes of Collins were given to the world somewhat earlier. Wordsworth, Coleridge, Shelley, Keats, and Tennyson poured some of their noblest verse into this form, while modifying it further, whether as *regular*—i.e. following a definite arrangement in stanzas, or as *irregular*, following no such arrangement. There are no finer odes or nobler poems in our language than Coleridge's odes *To the Departing Year* and *To France*; Wordsworth's *To Duty* and *Intimations of Immortality from Recollections of Early Childhood*; Shelley's *To the West Wind*, *To a Skylark*, *To Liberty*, and *To Naples*; Keats's odes *To a Nightingale*, *On a Grecian Urn*, and *To Autumn*; Tennyson's funeral ode *On the Death of the Duke of Wellington*; and Swinburne's *To Victor Hugo in Exile*.

See *English Odes* (1881), admirably selected by Edmund W. Gosse, with an excellent introduction; and the subtle and suggestive article 'Poetry,' by Theodore Watts, in vol. xix. (1885) of the *Encyclopædia Britannica*.

Odense, the chief town of the Danish island of Fünen (q.v.). Its cathedral was founded in 1086; and diets were held here in 1527 and 1539. Pop. (1880) 20,804; (1890) 30,277.

Odenwald, a mountainous system partly in Baden and Bavaria, but mainly in Hesse (q.v.).

Oder (Lat. *Viadrus*, Slavon. *Vjodr*), one of the principal rivers of Germany, rises in the Oderberg on the tableland of Moravia, 1950 feet above the level of the sea, traverses Prussian Silesia, Brandenburg, and Pomerania, then empties itself into the Stettiner Haff, whence it passes into the Baltic by the triple arms of the Dievenow, Peene, and Swine, which enclose the islands of Wollin and Usedom. It has a course north-west and north of 550 miles, and a basin of 50,000 sq. m. The rapid flow, induced by its very considerable fall, together with the silting at the embouchures of the numerous tributaries, renders the navigation difficult; great expense and labour being, moreover, necessary to keep the embankments in order, and prevent the overflowing of the river. Canals connect the Oder with the Spree, the Havel, and the Elbe; the Warthe is the only tributary of importance for navigation. On the banks of the Oder are Ratibor (where it is navigable for barges), Brieg, Breslau, Frankfort-on-the-Oder, Stettin, and Swinemünde.

Odescalchi. See INNOCENT XI.

Odessa, in point of population the fourth city of Russia, stands on the shore of the Black Sea, about midway between the estuaries of the Dniester (25 miles to the south-west) and the Dnieper, 90 miles north-east of the Danube mouth, and by rail 967 miles from Moscow and 381 from Kieff. The city is built facing the sea on low cliffs, seamed with deep ravines and hollowed out by galleries in

the soft rock, in which numbers of the poorest inhabitants herd together. Above ground its streets are long and broad, and cross each other at right angles. Odessa was only founded in 1794, near a Turkish fort that fell into Russian hands in 1789; but it quickly became the principal export town for the extensive corn-growing districts of South Russia. Its progress was greatly aided by its being declared a free port from 1817 to 1857, and again by the construction of the railway to Kieff in 1866. The population has increased rapidly, from 3150 in 1796 to 25,000 in 1814, 100,000 in 1850, 184,800 in 1873, and 270,600 in 1887. Close upon 70,000 of these were Jews, dividing with the Greeks most of the trade. Merchants of many other nationalities dwell here also, especially from the countries round the Black Sea. The harbour is made up of a roadstead and three basins, protected by moles against the dangerous winds that sweep the Black Sea. It is impeded by ice—scarcely ever closed by it—during an average of only a fortnight in the year. The bulk of the exports consists of grain, principally wheat; the total quantity of grain sent abroad in 1889 was valued at £10,889,062, wheat alone being estimated at £7,497,000. The figures for wheat fluctuate, however, between the last-quoted sum and £2,209,000 (1886). The value of the gross exports has steadily increased, doubling between 1886, when the figure was £8,279,900, and 1889, when it reached £16,787,700. Sugar (£1,217,400 in 1889), wool, and flour are the remaining chief items of export. The imports (raw cotton, oils, groceries, iron and steel, coal, food-stuffs, fruits, tea, tobacco, machinery) average £3,856,500 (five years from 1885). An average of 1295 vessels of 1,370,256 tons enter the port every year, an average of 716 of these vessels, with a tonnage of 1,180,245, being British, the Russian tonnage being only one-fifth of this. But the Russians carry on a large and increasing coasting trade. The chief branches of industrial activity are flour-milling, sugar and oil refining, and, in a secondary degree, the manufacture of tobacco, machinery, leather, soap, chemicals, biscuits, &c. Odessa has a university (1865) with close upon 600 students, and the usual cabinets and collections; a great number of schools, including a cadet, a commercial, and two music schools; several learned societies, and a public library (1829) of 40,000 vols., many of them rare. The museum of the Historical and Antiquarian Society contains treasures from the coasts of the Black Sea, belonging to the Hellenic, the Venetian-Genoese, and the Tartar-Mongol civilisations. Amongst the public buildings of Odessa we mention the cathedral (1802-49), which is the church of the Archbishop of Kherson, three dozen other churches, a very fine opera-house (1887), palatial grain-warehouses, corn-elevators, and the 'palais royal,' which, with its gardens and park, is a favourite place of resort. Monuments to Count Worontsoff (1863), the Duke de Richelieu (1827)—both great benefactors of Odessa—and Pushkin (1889) adorn the city. Water is brought by aqueduct (27 miles long) from the Dniester. Numerous coast batteries have been built since 1876 to prevent a recurrence of bombardment, such as happened when the British fleet sailed past the city in April 1854. Odessa has an unenviable notoriety as a home of the cholera, for its persecution of the Jews, and for its Nihilist sympathies.

Odeypoor. See UDAIPUR.

Odilon-Barrot. See BARROT.

Odin (*Odinn*; O. H. Ger. *Wuotan*; Saxon, *Wodan*, or *Woden*—whence *Wednesday*), the chief god of northern mythology, common to all Germanic peoples. He is not the creator of the world, but its ruler, king of heaven and earth. Odin, as

the highest of the gods, the *Alfadur*, rules heaven and earth, and is omniscient. As ruler of heaven, his seat is the palace Hlidskialf in Asgard, from whence his two black ravens, Hugin (Thought) and Munin (Memory), fly forth daily to gather tidings of all that is being done throughout the world. As god of war, he holds his court in Valhalla, whither come all brave warriors after death to revel in the tumultuous joys in which they took most pleasure while on earth. His greatest treasures are his eight-footed steed Sleipner, his spear Gungner, and his ring Draupner. As the concentration and source of all greatness, excellence, and activity Odin bears numerous different names. By drinking from Mimir's fountain he became the wisest of gods and men, but he purchased the distinction at the cost of one eye. He is the greatest of sorcerers, and imparts a knowledge of his wondrous arts to his favourites. Frigga (q.v.) is his queen, and the mother of Balder (q.v.), the Scandinavian Apollo; but he has other wives and favourites, and a numerous progeny of sons and daughters. He is claimed as ancestor of various royal dynasties. Rhys contends that the myths relating to Woden, the great Teutonic sky-god, may be traced to a Celtic origin, and compares the name Woden with the Celtic Gwydion. See SCANDINAVIAN MYTHOLOGY.

Odoacer, ODOVACAR, the ruler of Italy from the year 476 to 493, was the son of *Ædico*, a captain of the Germanic Scyrr. He entered the military service of the western Roman empire, and rapidly rose to eminence. He took part in the revolution by which Orestes (475) drove the Emperor Julius Nepos from the throne, and conferred on his son Romulus the title of Augustus, which the people scoffingly changed into Augustulus. He soon perceived the weakness of the new ruler, and at the head of the Germanic mercenaries—Herulians, Rugians, Turcilingians, and Scyrr—marched against Pavia, which Orestes had garrisoned, stormed the city, and put his opponent to death (476). Romulus abdicated, and withdrew into obscurity. Thus perished the Roman empire. Odoacer showed himself to be a wise, moderate, and politic ruler, sought to conciliate the Byzantine emperor Zeno, and, with the title of *Patricius*, ruled Italy from Ravenna. The barbarian ruler did everything in his power to lift Italy out of the deplorable condition into which she had sunk. Though an Arian himself, he acted with a kingly impartiality that more orthodox monarchs have rarely exhibited. He conducted a successful campaign in Dalmatia, and against the Rugii on the Danube. The increasing power of Odoacer excited the jealousy and alarm of Zeno, who encouraged Theoderic, king of the Ostrogoths, to undertake an expedition against Italy (489). Odoacer, defeated in three great battles (at Isonzo, at Verona, and on the Adda), shut himself up in Ravenna, which he bravely defended for three years. Compelled by famine, he capitulated (493) on condition that the kingdom of Italy should be shared between him and Theoderic; but a fortnight after Odoacer was assassinated at a feast by Theoderic himself. See Hodgkin, *Italy and her Invaders*.

Odometer. See PEDOMETER.

O'Donnell, LEOPOLD, Marshal of Spain, born at Teneriffe, 12th January 1809, was descended from an ancient Irish family. He entered the Spanish army when young, and espoused the cause of the infant Queen Isabella against Don Carlos (see CARLISTS). When the Carlists were overthrown he was created Chief of the Staff to Espartero. He took the side of the queen-mother in 1840, emigrated with her to France, and took up his residence at Orleans, where he planned many of

the political risings which took place under the rule of Espartero. In 1843 his intrigues against Espartero (q.v.) were successful; and he was rewarded by the governor-generalship of Cuba, where he amassed a large fortune by favouring the iniquitous trade in slaves. When he returned to Spain (1848) he intrigued against Bravo Murillo and Narvaez; was made war minister by Espartero in 1854; but plotted against his benefactor, and in 1856 supplanted him by a *coup d'état*. He was in three months' time succeeded by Narvaez, but in 1858 he returned to power; in 1859 he commanded the army in Morocco, and after a tedious campaign took the Moorish camp, and the city of Tetuan surrendered, whereupon he was made Duke of Tetuan. In 1866 his cabinet was upset by Narvaez, and he died at Bayonne, 5th November 1867.

Odontopteryx (Gr. *odous*, 'a tooth'; *pteryx*, 'a wing'), a goose-like or duck-like bird, the remains of which occur in the London clay (see EOCENE SYSTEM). The alveolar margins of both jaws are furnished with tooth-like denticulations, which are actual parts of the bony substance itself, and, therefore, not like true teeth. The tooth-like serrations, of two sizes, are of triangular or compressed conical form, and are all directed forwards.

Odontornithes, extinct toothed birds from the Cretaceous strata of North America. There are two distinct types—Ichthyornis and Hesperornis. The former and its relative Apatornis were small tern-like flying birds, with teeth in sockets, and with biconcave vertebrae. But Hesperornis was a large bird, about six feet long, with utterly degenerate wings and obviously incapable of flight. According to Marsh, to whom our knowledge of these forms is chiefly due, it was a consummate diver, even more aquatic than the penguin. The teeth are set in grooves, the vertebrae saddle-shaped. 'A bird indeed,' Stejneger says, 'but a kind of swimming, loon-like raptorial ostrich, without fore-limbs, with the gape armed with formidable rows of strong teeth like a gigantic lizard, and with a large, broad, and flattened tail like a beaver.' See Marsh's monograph (1880).

Ecolampadius, JOANNES (the Latin form of HAUSSCHEIN, although his proper name was Hussagen), one of the most eminent of the coadjutors of Zwingli in the Swiss Reformation, born in 1482 at Weinsberg, in Swabia. He relinquished the study of law at Bologna for that of theology at Heidelberg, became tutor to the sons of the Elector Palatine, and subsequently preacher in Weinsberg. Being appointed preacher at Basel, he formed the acquaintance of Erasmus, who employed him as assistant in his edition of the New Testament. In 1516 he left Basel for Augsburg, where also he filled the office of preacher, and where he entered into a convent. But Luther's publications exercised so great an influence on him that he left the convent, and became chaplain to Franz von Sickingen, after whose death he returned to Basel in 1522, and, in the capacity of preacher and professor of Theology, commenced his career as a reformer. He held disputations with supporters of the Church of Rome in Baden in 1526, and in Bern in 1528. In the controversy concerning the Lord's Supper he gradually adopted more and more the views of Zwingli. In 1529 he disputed with Luther in the conference at Marburg, and he wrote several treatises. He died at Basel, 24th November 1531. He was remarkable for his gentleness of character. There are Lives in German by Herzog (1843) and Hagenbach (1859).

Ecumenical. See ECUMENICAL.

Ede'ma (Gr., 'a swelling') is the term applied in medicine to the swelling occasioned by the effu-

sion or infiltration of serum into cellular or areolar structures. The subcutaneous cellular tissue is the most common seat of this affection. Edema is not a disease, but a symptom, and often a symptom indicating great danger to life. The means of removing it must be directed to the morbid condition or cause of which it is the symptom.

Oedenburg (Hung. *Soprony*), a town of Hungary, situated in an extensive plain, 3 miles W. of the Neusiedler See and 48 S. by E. of Vienna. It is one of the most beautiful towns in Hungary, and has manufactures of candied fruits, sugar, soap, &c., with a large trade in wine, corn, and cattle, the neighbourhood being rich and well cultivated. The Roman town of *Scarabantia* here was one of considerable importance; and numerous Roman remains have been found. Pop. 22,322.

Œdipus (Gr. *Oidipous*), the hero of a legend which supplied subjects for some of the noblest tragedies of Sophocles and Euripides. Œdipus was the son of Laius, king of Thebes, by Jocasta, the sister of Creon, and was exposed after his birth, with his feet pierced through, on Mount Cithæron, because his father had learned from an oracle that he was doomed to perish by the hands of his own son. The child was discovered by a herdsman of Polybus, king of Corinth, and was named Œdipus from his swollen feet. Polybus brought him up as his own son. Being told by the oracle at Delphi that he was destined to slay his father and commit incest with his mother, he would not return to Corinth, but proceeded to Thebes to escape his fate. As he drew near he met the chariot of the king, and the charioteer ordering him out of the way, a quarrel ensued, in which Œdipus unwittingly slew Laius. In the meantime the famous Sphinx had appeared near Thebes, and propounded a riddle to every one who passed by, putting to death all who failed to solve it. In the terror of despair the Thebans offered the kingdom, together with the hand of the queen, to whoever should deliver them from the monster. Œdipus offered himself, whereupon the Sphinx asked him, 'What being has four feet, two feet, and three feet; only one voice; but whose feet vary, and when it has most, is weakest?' Œdipus replied that it was man, whereat the Sphinx threw herself headlong from the rock on which she sat. Œdipus became king, and husband of his mother, Jocasta. From their incestuous union sprung Eteocles, Polynices, Antigone, and Ismene. A mysterious plague now devastated the country, and, when the oracle declared that before it could be stayed the murderer of Laius should be banished from the country, Œdipus was told by the seer Tiresias that he himself had both murdered his father and committed incest with his mother. In his horror he put out his own eyes, that he might no more look upon his fellow-creatures, while Jocasta hanged herself. He wandered towards Attica, accompanied by his daughter Antigone, and at Colonus near Athens the Eumenides charitably removed him from earth.

Œhlenschläger, ADAM GOTTLÖB, Danish poet, was born 14th November 1779 in a suburb of Copenhagen, where his father, a Sleswick, was an organist. After an irregular and desultory course of education, he tried unsuccessfully the career of an actor, and then took to law studies, but soon devoted all his energies to the cultivation of the history and poetry of his own country. In 1803 appeared his first collection of poems; and the *Vaulunders Saga* (1805) and *Aladdins forunderlige Lampe* raised him to the rank of the first of living Danish poets. These early efforts were rewarded by a travelling pension, which enabled

him to spend some years in travelling the Continent, and becoming acquainted with Goethe and other literary celebrities. During this period Œhlenschläger wrote his *Hakon Jarl*, the first of his long series of northern tragedies (1807; Eng. trans. by F. C. Lascelles, 1875), and at Rome his *Correggio* (1809; Eng. trans. by Theodore Martin, 1854). In 1810 Œhlenschläger returned to Denmark, where he was hailed with acclamation, and made professor of *Æsthetics* in the university. In 1814 took place his literary feud with Baggesen (q.v.). In 1819 appeared one of his most masterly productions, *Nordens Guder*, which showed that the severe criticism to which his writings had been exposed during the celebrated Baggesen quarrel had corrected some of the faults, and lessened the self-conceit which had characterised his earlier works. His reputation spread with his increasing years both abroad and at home. In 1829 he went to Sweden, where he was welcomed by a public ovation; and he was honoured in his own country in 1849 by a grand public festival in the palace at Copenhagen. He died 20th January 1850. His fame rests principally on his twenty-four tragedies, most of them on northern subjects. Besides those already referred to, the best are *Knud den Store*, *Palnatoke*, *Axel og Walborg*, *Væringerne i Miklagard*. His lyrical and epic poems are of less value. His *Poetiske Skrifter* were edited in 1857-62 in 32 vols.; the German translations were done by himself. An Autobiography appeared in 1830-31, his *Reminiscences* in 1850; and there are *Lives* by Arentzen (1879) and Nielsen (1879). His Danish and German works amount in all to 62 volumes.

Œhler, GUSTAV FRIEDRICH, one of the greatest Old Testament scholars of the 19th century, was born at Ebingen, 10th June 1812, studied at Tübingen, laboured as a teacher at Basel and Tübingen, became in 1840 professor in the theological seminary in Schöenthal, and in 1845 ordinary professor of Theology at Breslau. In 1852 he was called to Tübingen to be head of the theological seminary, and here he died, 19th February 1872. The chief books of this learned and reverent scholar were *Prolegomena zur Theologie des Alten Testaments* (1845), *Die Grundzüge der Alt-testamentlichen Weisheit* (1854), *Ueber das Verhältniss der A. T. Prophetie zur heidnischen Mantik* (1861), *Theologie des Alten Testaments* (1873-74; Eng. trans. 1874-75), and *Lehrbuch der Symbolik* (1876). See the study by Knapp (Tüb. 1876).

Œland, a long and narrow island in the Baltic, 4 to 17 miles from the east coast of Sweden. It is 55 miles long and 5 to 12 broad; pop. 37,513. Scarcely more than a limestone cliff, it is scantily covered with soil, but in some parts it is well wooded, and has good pasture-ground; there are large alum-works; and the fishing is excellent all round the coasts.

Œls, a manufacturing town of Prussian Silesia, 16 miles ENE. of Breslau by rail. Pop. 10,276.

Œnanthic Ether. See **ETHER**.

Œnoth'era, a genus of ornamental plants of the natural order *Onagraceæ*, related to the *Fuchsia* (q.v.), though strikingly dissimilar in general appearance. The Evening Primrose (*Œ. biennis*), a native of Virginia, has been known in Europe since 1614, and is now naturalised in many parts of Europe and in some parts of Britain, on the banks of rivers, in thickets, on sandy grounds, &c. The flowers are fragrant in the evening. The root somewhat resembles a carrot in shape, but is short; it is usually red, fleshy, and tender, and is eaten in salads, or in soups, and as a boiled vegetable. Eaten after dinner it incites to wine-drinking, as olives do. This and numerous other species of

Oenothera, chiefly natives of North America, are very generally cultivated in English flower-gardens.

Evening Primrose
(*Oenothera biennis*).

Oera Linda Book. See FRISIANS.

Erëbro, a town of Sweden, at the entrance of the Svarta into the Hjelmar Lake, 170 miles W. of Stockholm by rail. It has an ancient castle, in which many diets have been held; and there is a trade in minerals and matches. Pop. 13,618.

Ersted, HANS CHRISTIAN, physicist,

was born 14th August 1777, at Rudkjobing, on the Danish island of Langeland, and studied medicine at Copenhagen, where in 1806 he was appointed extra-ordinary professor of Physics. He held numerous scientific appointments and honorary offices and distinctions, and died 9th March 1851. He may be regarded as the father of the science of electro-magnetism (see ELECTRICITY, Vol. IV. p. 265), and made numerous chemical discoveries. Of his many works the best known are *Naturlarens Mechaniske Deel* (1845; 3d ed. 1859) and *Aanden i Naturen* (1850). His collected works were translated into German in 6 vols. (1850-53). There is a biography by Hauch and Forchhammer (1853).—His brother, ANDERS SANDØE (1778-1850), was a distinguished Danish statesman.

Oesel, an island in the Baltic belonging to the Russian government of Livonia, and lying across the mouth of the Gulf of Riga. It is about 45 miles in length from north-east to south-west, has an area of 1000 sq. m., and a pop. of 50,600. The surface is undulating, broken by low hills, marshy, watered by numerous small streams, and well wooded. The coast is generally formed by high cliffs. The climate is milder than that of the neighbouring continental districts. The only town is Arensburg, on the south-east coast (pop. 4000). Many of the inhabitants of Arensburg are of German descent, as are the nobles and clergy of the island; but the peasantry are Estonian. Long governed by the Teutonic Knights, it became a Danish province in 1559, was given up to Sweden in 1645, and in 1721 fell into the hands of Russia.

Oesophagus, or GULLET, a membranous canal about 9 inches in length, which extends from the pharynx to the stomach, and thus forms part of the alimentary canal. See DIGESTION, Vol. III. p. 814; and CHOKING.

Estridæ. See BOT.

Oetinger, CHRISTOPH FRIEDRICH, theosophic theologian, was born in 1702 at Göppingen, and, after holding various cures, died at Murrhardt, 10th February 1782. His sermons (5 vols.) were published in 1857, and his collected works (7 vols. edited by Ehmann) in 1858-67. His system has been described as lying between Jacob Boehme and Schelling. See monographs by Außerlin (1848), Ehmann (1852; 2d ed. 1877), and Wächter (1885).

Ofen. See PESTH.

Offa's Dyke, an entrenchment extending along the border of England and Wales, from the north coast of Flintshire, on the estuary of the Dee, through Denbigh, Montgomery, Salop, Radnor, and Hereford, into Gloucestershire, where its southern termination is near the mouth of the Wye. In some places it is nearly obliterated by cultivation; in others it is of considerable height. Nearly parallel with it, some two miles to the east, is *Watt's Dyke*, which, however, seems never to have been so great a work. Offa, king of Mercia, is said to have erected Watt's Dyke in 765 to keep back the Welsh, and Offa's Dyke a few years later.

Offenbach, a manufacturing town of Hesse-Darmstadt, on the south bank of the Main, 5 miles by electric railway SE. of Frankfurt. Among its manifold industrial products are chemicals, fancy leather goods, machines, and carriages. The *schloss* is a residence of the princely House of Isenburg-Birstein. Pop. (1831) 7802; (1875) 26,012; (1885) 31,704.

Offenbach, JACQUES, a composer of opera bouffe, born of Jewish parents at Cologne, 21st June 1819. He came to Paris in 1833, and settled there, becoming *chef d'orchestre* in the Théâtre Français in Paris in 1848, and manager of the *Bouffes Parisiennes* in 1855. He died 5th October 1880. Offenbach composed a vast number of light, lively operettas, *La Mariage aux Lanternes*, *La Fille d'Elezondo*, &c., perfect as musical trifles; but the productions by which he is best known are a series of burlesque operas, in virtue of which he must be regarded as the inventor of the modern form of opera bouffe. Amongst the most notable are *Orphée aux Enfers* (1858), *La Belle Hélène*, *La Barbe Bleue*, *La Grande Duchesse*, *Geneviève de Brabant*, and *Roi Carotte*. *Madame Favart* (1878) became almost as popular in England as in France.

Offertory (Lat. *offertorium*, from *offero*, 'I offer') is the name given to that portion of the public liturgy of the Roman Catholic Church with which the eucharistic service, strictly so called, commences (see LITURGY). This offering of the bread and wine in the public service became, from a very early period, the occasion of a voluntary offering, on the part of the faithful; originally, it would seem, of the bread and wine designed for the eucharistic celebration and for the communion of the priest and the congregation. By degrees other gifts were superadded to those of bread and wine—as of corn, oil, wax, honey, eggs, butter, fruits, lambs, fowl, and other animals; and eventually of equivalents in money or other objects of value. The last-named class of offerings, however, was not so commonly made upon the altar and during the public liturgy as in the form of free gifts presented on the occasion of other ministerial services, as of baptism, marriages, funerals, &c.; and from this has arisen the practice in the Roman Catholic Church of the mass-offering, or *honorarium*, which is given to a priest with the understanding that he shall offer the mass for the intention (whence the honorarium itself is often called an 'intention') of the offerent. See also COLLECTIONS.

Officers, MILITARY AND NAVAL.—*Military Officers* are combatant and non-combatant, the latter term including paymasters, medical officers, commissariat, and other departmental officers. The great divisions of rank in the British army are commissioned, warrant, and non-commissioned officers. Commissioned officers hold commissions from the crown, and comprise all of the rank of second-lieutenant or corresponding or superior rank. Some warrant officers also hold honorary

commissions. Classified by duties, they are staff or regimental officers; divided by rank, General Officers (q.v.), Field-officers (q.v.), and troop or company officers. The last are captains, lieutenants, and second-lieutenants. Warrant officers in the army are master-gunners (1st and 2d class), bandmasters, schoolmasters, garrison and regimental sergeant-majors, superintending clerks, and conductors of the army service and ordnance store corps. Non-commissioned officers are described under that heading.

Naval Officers are divided into three classes: commissioned, warrant, and subordinate officers. The commissioned officers are admirals, captains, commanders, lieutenants, sub-lieutenants, chief warrant officers, paymasters, doctors, engineers, and naval instructors. All officers of the civil branches of the navy, as paymasters, doctors, and engineers, rank relatively with officers of the military branch according to their standing in the service, as, for instance, an inspector-general of hospitals ranks with a rear-admiral, a chief-paymaster with a captain, and so on. The warrant officers are the boatswains, gunners, and carpenters. The third class comprises midshipmen, naval cadets, clerks, and engineer students; these officers have neither commissions nor warrants, but are simply appointed by the Admiralty; they are on probation, and are liable to be summarily removed at any time for such causes as failure to make satisfactory progress in their studies, general inefficiency, &c. No officer of the civil branch, no matter how high may be his relative rank, can ever assume any command, so long as an officer of the military branch is present. Petty officers are not officers, they are analogous to non-commissioned officers in the army; they will be described under their own heading, as they constitute a very important body of men in the navy.

Official Plants (Lat. *officina*, 'a shop') are those medicinal plants which have a place in the pharmacopœias of different countries, and which are therefore sold—or some of their products or preparations of them—by apothecaries and druggists. The medicinal plants cultivated to any considerable extent are all official, but many are also official which are not cultivated.

Offsets. See SURVEYING.

Ofterdingen, HEINRICH VON (*circa* 1400), one of the most famous Minnesinger (q.v.).

Ogam. This word is sometimes written Ogham, but it should then be pronounced with a *gh* mute, as in modern Irish, to which the spelling *Ogham* belongs. In English, however, it is preferable to pronounce the *g*, and to spell the word Ogam, as in older Irish; then there will be the noun *Ogam* and the adjective *Ogmic*, for which we have the sanction of such authorities as Whitley Stokes and Nigra.

The term Ogam is associated with Ogma, the champion of the mythic *Tuatha Dé Danann*—i.e. the tribes of the goddess Danu, or Dón as she is called in the Mabinogion of the Welsh. Ogma's name is, letter for letter, the Irish equivalent of *Ogmios*, the name of the Gaulish divinity quaintly described by Lucian as a Celtic Heracles, which meant a Heracles who performed his feats by dint of eloquence, not by the force of his arms. So the Gauls pictured him leading crowds of willing captives, bound to him by minute chains connecting their ears with the tip of his tongue. The Irish account of Ogma is not inconsistent with the Gaulish one of Ogmios; for the former, besides being a warrior and the champion of the *Tuatha Dé Danann*, is represented as eminently skilled in languages; so he is said to have invented two things, a dialect for the learned, and an alphabet or form of writing. Both are called Ogam. The Ogam dialect, on which a learned paper by Dr

Thurneysen should be read in the *Revue Celtique* (vol. vii. p. 369–374), proves to have been a jargon of artificial and pedantic origin. It is needless to say that the attribution of such an invention to Ogma can have formed no part of early Irish tradition about Ogma; and, as there is no reason to suppose the Ogam alphabet to date till late in the Roman occupation of Britain, much the same remark must apply to the invention of that form of writing. It is not hard, however, to see why both came in the course of time to be ascribed to Ogma: he was, like his Gaulish namesake, probably a hero of words, of speech, and of eloquence, so that any linguistic invention might readily gravitate into association with his name.

Putting aside the Ogam dialect, we shall now confine our remarks to the Ogam alphabet, premising that the key to it was never lost in Irish literature, though little attention was devoted to it by scholars till after the discovery of the bilingual inscription at St Dogmael's, near Cardigan, in South Wales. But in Irish manuscripts the values of the Ogam characters are naturally given as those of the Irish letters in the pronunciation familiar to the writers of those manuscripts; so when we deal with Ogams, let us say, of the 5th or the 6th century, certain corrections have to be made in the equivalents. The following is the Ogam alphabet, with the value of each symbol as it has been ascertained from the most ancient class of the monuments in question:

(h)	d	t	c	gu	b	l	w	s	n
m	g	ng	(f)	r	a	o	u	e	i

On this let us remark that the continuous line represents the edge of the stone on which the digits are cut. Taking an Ogam stone *in situ*, one most commonly reads upwards, and the scores are placed on either side of the edge. In some instances the vowels are not mere notches in the edge of the stone, but scores of nearly the same length as those of the third group, but differing from them in being cut perpendicular to the edge. This would seem to supply a reason for the slanting of the digits of the third group, but that is not supported by the most ancient class of inscriptions. Turning to the individual characters, the value of *h* given to the first of them is derived only from Irish tradition, but there is no reason to doubt its accuracy, though the writer has never come upon any good inscriptional evidence in point. The same, till lately, might be said of the case of *ng*, but he has found

/// in an ancient inscription for the nasal in the borrowed word, *Sancti*.

The case of /// is one of some difficulty, as the letter has never been found in an inscription, while Irish tradition ascribes it the value of *z* or *st*. This, however, does not mean two different accounts of the Ogam, as the Irish sometimes treated *z* and *st* as equivalents, as, for example, when they wrote *steta*, *Stephyrus*, and *Elistabeth* for *zeta*, *Zephyrus*, and *Elizabeth*. It should be explained that *st* has long been commonly reduced in Irish words to *s* or *ss*. Thus all that Irish tradition respecting this Ogam seems to mean is, that it was *z* or a certain other sibilant. Now, as to *z* representing the soft sound corresponding to the sharp sound of *ss*, it is not to be found in Irish from the 9th century down, and it is doubtful whether it existed in the language late enough to claim a place in the Ogam alphabet. We venture to accept the indication afforded by Irish tradition, that /// was a sibilant, or let us

say an *s*, for that is the only sibilant known to the language, except *sh*, which is written *s* preceding *e* or *i*; we must therefore look for a class of words where the actual or attested *s* of Irish stands for a consonant which was at one time not an *s*. We have such probably in borrowed words, like *srian*, 'a bridle,' from the Latin *frenum*, or *seiniistir*, 'a window,' from the Latin *fenestra*. But the change from *f* to *s* is not confined to borrowed words, as there is a group of words with *s* in modern Irish corresponding to Welsh *ff*, as in Irish *sonn*, Welsh *ffon*, 'a staff,' in which the initial combination of consonants seems to have been at first *sp* or *sp-h*. This would seem to have been simplified into *f* or *φ*, and that ultimately changed in Irish into *s*. We should accordingly be inclined to believe that *f* or *φ* was the value of the Ogam /// ; and the phonetic change afterwards

into *s* would account for the sibilant value ascribed to this Ogam by Irish tradition. Moreover, a genitive *Fanoni* in a Devonshire inscription, reading in Roman letters FANONI MAQVIRINI, shows that early Irish had the sound of *f* or *φ*; and as the Ogam alphabet provided no symbol for it, unless it was /// , this consideration confirms the

conclusion already suggested. It is right here to remark that modern Irish has the consonant *f* in abundance, but in earlier Irish this was *w* or *v*, which between vowels has since been everywhere elided, while initially it has been strengthened into *f*; thus, in Adamnan's *Life of St Columba* the name *Fergna* is *Virgnous*, while the ancient *Terra Convalcorum* in Louth appears in the Annals of the Four Masters as *Tir-Conaille*, or rather *Tir-Conaille-Cerd*, to distinguish it from the district of Tirconnell in Donegal. As to the Ogam |||| , which we have transliterated *qu*, that combination, when written in Latin capitals, is found represented by QV, as in the MAQVIRINI, already cited; the exact pronunciation of the *u* cannot be ascertained, but it was probably not very far from that of the English *w*, as in one instance the QV is represented in Ogam by *go* or $\text{||||}+$, and in one other by *qw* or $\text{||||}++$. In any case, it is worthy of note that no instance of confounding |||| (*qu*) with ||| (*c*) is known to occur in the more respectable class of Ogam inscriptions. Lastly, a character \times occurs, which was, as it were, outside the Ogam alphabet of twenty symbols. In Ireland this \times had two values: sometimes it represented one of the sounds of *e* and sometimes the consonant *p*; the latter was also its value in South Wales, where it occurs in the Ogmie spelling of the genitive of the Roman name *Turpillus*. In Goidelic words themselves it cannot have been often wanted, as the *p* of the Aryan parent speech is nowhere retained in the Celtic languages. It is noticed, however, that in some words the place of Aryan *p* was occupied in Old Irish by *h*; e.g. *huile*, 'all,' from the same stem as the Greek *πολλοί*, 'many,' and *huathad*, 'the singular number,' from the same root as Latin *paucus*, English *few*.

A word must now be said of the distribution of Ogam monuments. All the Ogam inscriptions, whether still existing or known to have once existed, number not quite 300, most of which consist of epitaphs. Of that number about 250 belong to Ireland, mostly the southern counties, especially Kerry, Cork, and Waterford, though one has been heard of as far north as Londonderry. The Ogams in Britain and the islands make rather less than fifty in all, and of these South Britain has none east of Wales and Devon. Within this area the county which has most

specimens to show is Pembrokeshire (including Caldy Island), and next in order come the other South Welsh counties and Devon, while Cornwall boasts only a single instance, and that of a somewhat doubtful nature. No Ogams have been found in Mid-Wales, and only one is known in North Wales—to wit, near Ruthin, in the county of Denbigh. The Ogams of Wales, however, and Devon have an importance out of all proportion to their number, owing to the fact that most of them are accompanied by a version in Latin. Proceeding northwards, one comes across a highly interesting group of Ogams in the Isle of Man; but the first Scotch Ogam is a very doubtful one, to be found, as it is supposed, in the island of Gigha, between Cantyre and Islay.

There are, however, about fourteen Ogams mentioned as belonging to Scotland, most of which have no doubt attaching to them as to their being Ogams, though more doubt than enough exists as to the import of some of them, or even to the language employed. They occur in the counties of Fife, Aberdeen, Elgin, and Sutherland; also in the islands of Orkney, and more frequently in those of Shetland.

The writer once thought that Ogmie and Runic writing could be traced to a common origin; but he no longer thinks so. In his opinion the most probable theory is that which regards the Ogam alphabet as invented during the Roman occupation of Britain, by a Goidelic grammarian who had seen the Brythons of the Roman province making use of Latin letters. The Celts were in the habit probably of setting up stones to mark the tombs of their great men, but it was presumably from the Romans they learned to inscribe them. It has been supposed that the inventor of the Ogam alphabet took a hint from a habit of scoring for the purpose of counting, and that his group

$\text{||} \text{||} \text{||} \text{||} \text{||}$ were the initials of the

five first numerals, which in modern Irish are *aon*, *dá*, *trí*, *ceathair*, *cúig*, for this only required one to regard *aon* as if it were *haon*, with an *h* prefixed according to a habit by no means uncommon in the case of certain words in Old Irish. Such a theory proves on examination to be substantially tenable, as the early Goidelic forms of the numerals in question were approximately the following: *oinos*, *duōu*, *tris*, *cetuōres*, *quēqqe*. The fourth, *cetuōres*, represented an earlier *quetuōres*, corresponding to the Latin *quatuor* and its congeners; but its first *u*, standing as it originally did in an unaccented syllable, was dropped, so that the word became *cetuōres*. The case of the initial *qu* of the fifth

The Newton Stone, Aberdeenshire, from a photograph appended to the reprint of the Earl of Southesk's paper mentioned below.

The Ogam inscription, as distinguished from that in alphabetic characters, is thus read by the Earl of Southesk: (A) IDDAI QNEAN FORRERI IBH UA IOSIE, and interpreted as 'Ada, daughter of Forar, of the race of the sons of Huas.'

numeral was different, as it immediately preceded the accent, which, moving forward as usual in Irish, fixed itself on the *u* (of *qu*), made into a pure vowel, so that *quégque* became *quégque*, or rather *ciúcce*, whence the attested forms *cóic* and *cuig*, 'five.' This is paralleled in Irish by *dóini*, 'men,' as contrasted with *duine*, 'man,' from some such Goidelic stem as *duēn*, so that the word for man has been explained to mean a mortal, and in part equated with the Greek *θνητός*, 'mortal.' Now, Manx Gaelic has not altogether followed Irish in its accentuation, and here the transition from *quégque* to *quégque* never took place, so the Manx for 'five' is *queig*; compare Manx *quei* or *quoi*, 'who.' The case of the first Ogam is more difficult, as we should have to suppose *h-aon* and *h-oinos*, where the cognate languages prove that the *h* cannot have been organic, even though it sometimes crept into the pronunciation of this word. It is possible, however, that the word doing service for the first numeral was one of a different origin—for instance, a word related to *huathad*, 'the singular number,' and *huaitiu*, 'lonelier,' 'loneliest'; and it is worthy of notice that one of the names of the Ogam for *h* was *huath*. In such words as these the *h* may be supposed, as already suggested, to have been of ancient standing.

Another circumstance sheds light on the history of the Ogam alphabet: the oldest class of inscriptions contain so many instances of *cc* and *tt* where later Irish has *ch* and *th* that the former digraphs cannot be the result of accident, but rather a recognised way of representing the spirants *ch* and *th*. But as *cc* and *tt* do not phonetically become *ch* and *th* in the course of phonetic decay in the Goidelic dialects, the question arises, what can have suggested such a spelling? On the other hand, Brythonic speech is given to the change here suggested—viz. the reduction of *cc* and *tt* into *ch* and *th*, and before the spelling with *h* was regularly adopted the spirants *ch* and *th* must have been historically represented by *cc* and *tt*. This, we venture to infer, suggested the digraphs *cc* and *tt* for *ch* and *th* respectively. Granting that we are so far on fairly firm ground, we may go further, and suggest that the inventor of Ogam writing, acquainted as he was with Roman and Brythonic writing, lived somewhere in what is now South Wales, or had at any rate visited that country: he probably belonged to the race of invaders from the south of Ireland, who made the Severn sea their highway to the heart of South Wales on the one side and Somerset and Devon on the other. The distribution of the Ogams indicate that the connection was close between the districts now represented by the counties of Pembroke and Waterford. The latter is divided by a low ridge of hills into Decies within Drum and Decies without Drum, where the name Decies refers to an ancient people called the Déisi, whom Irish tradition traces across to Pembrokehire.

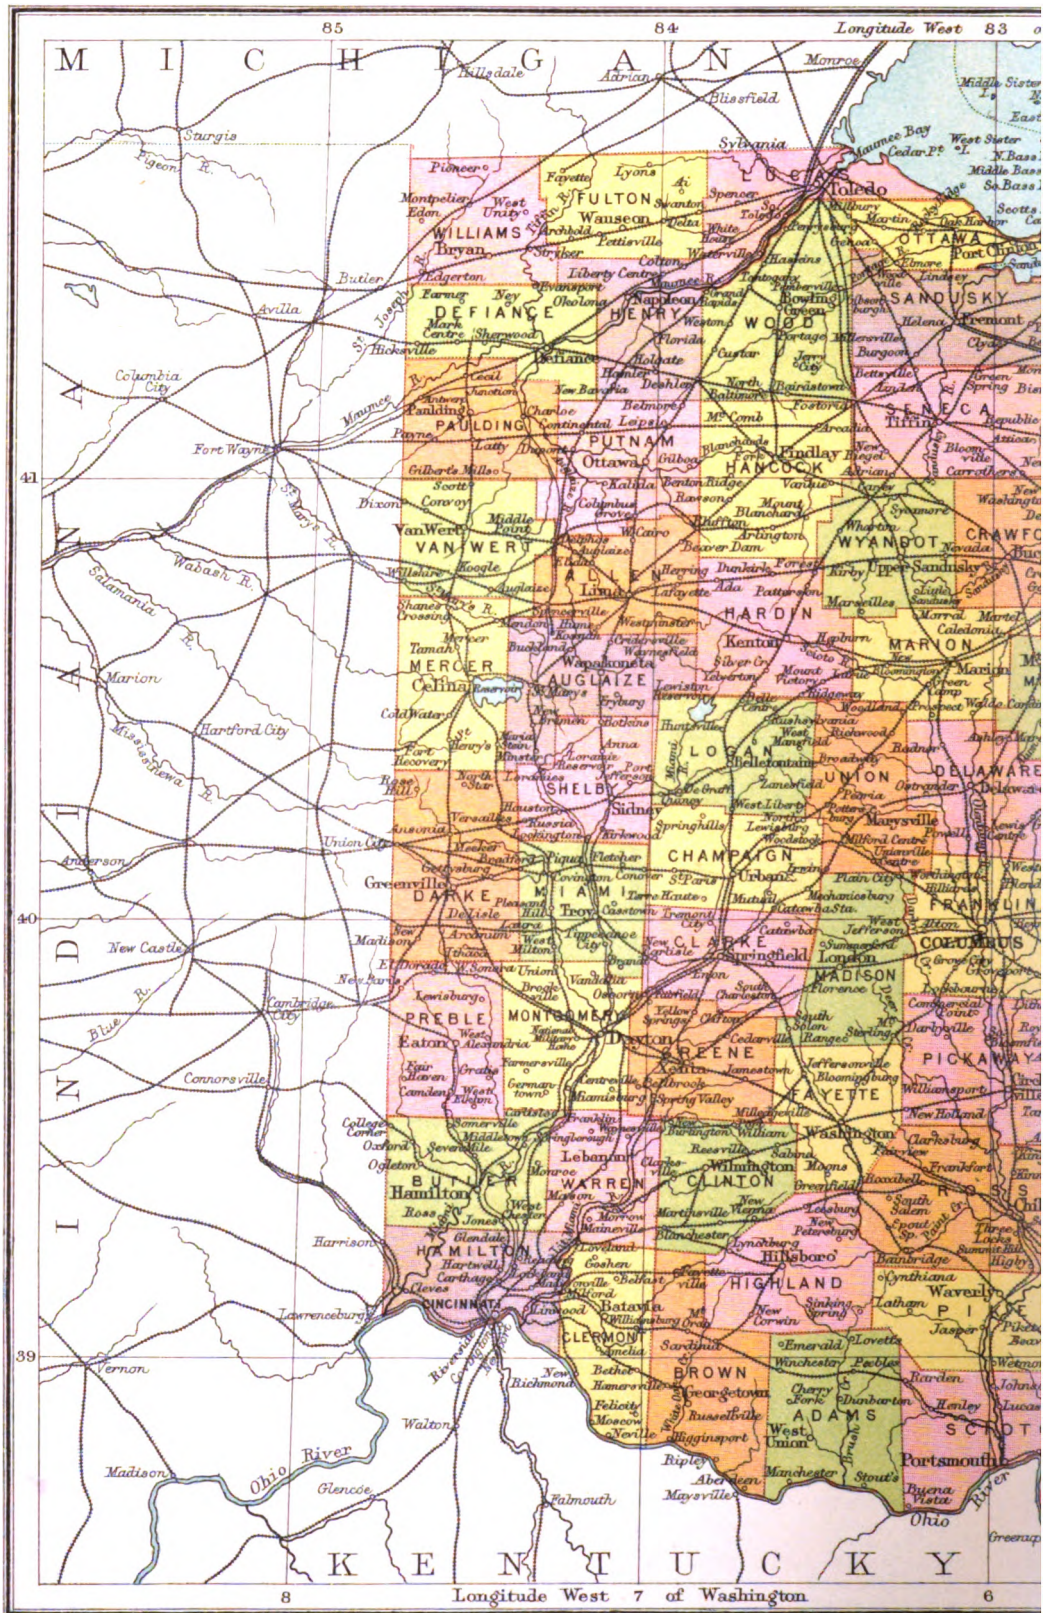

The ancient Ogams are all epitaphs on stone, but a few of the later ones occur on lead and on rings and brooches. So far as this goes, it might be gathered that stone was the most common material on which Ogams were cut; this may, however, be doubted, and more use may have been made of pieces of wood. In any case, when a workman had to cut an Ogam inscription on a tombstone, it was probably handed to him on a slip of wood with prepared angles. We can call to mind more than one instance where it can be shown that the cutter, so far from knowing what he was cutting, began the Ogam at the end instead of at the beginning. Had he had the Ogam before him on a piece of skin or any plane surface he might be expected to have cut the scores on the middle of the face of the stone. In fact, some of

the specimens of Ogams from Shetland are found to have been so written; and as the edge of the stone would be represented in manuscript by a continuous straight line, we find a groove scratched on the flat part of the stones, and the Ogam scores arranged in connection with it instead of following one of the edges. So it is not improbable that prepared pieces of wood formed the most usual material for cutting Ogams, as they seem to have done for the Runic alphabets of Teutonic nations. It is needless to mention that Ogam is not a species of shorthand: few hands could well be longer; and it ought likewise to be needless to say that there is nothing cryptic about this method of writing. It is a pretty general rule, for example, that a compound word of four syllables in the 5th or 6th century A.D. appears as a word of two in the modern dialects of Goidelic, so that an Ogmie genitive *Luguguriti* is later met with compressed into *Luicrid*. Here the changes which have taken place are in harmony with the ascertained rules of Irish accentuation, and no Celtic scholar would think of saying that *Luguguriti* is a cryptic form of *Luicrid*: that would be simply to deny the history of the word any phonological perspective, and so in other cases. Lastly, for the study of Goidelic philology the importance of the Ogam inscriptions extant, few comparatively speaking and meagre as they are, is much the same as that of Roman inscriptions would be for Romance philology, supposing all other remains of Latin speech had utterly perished.

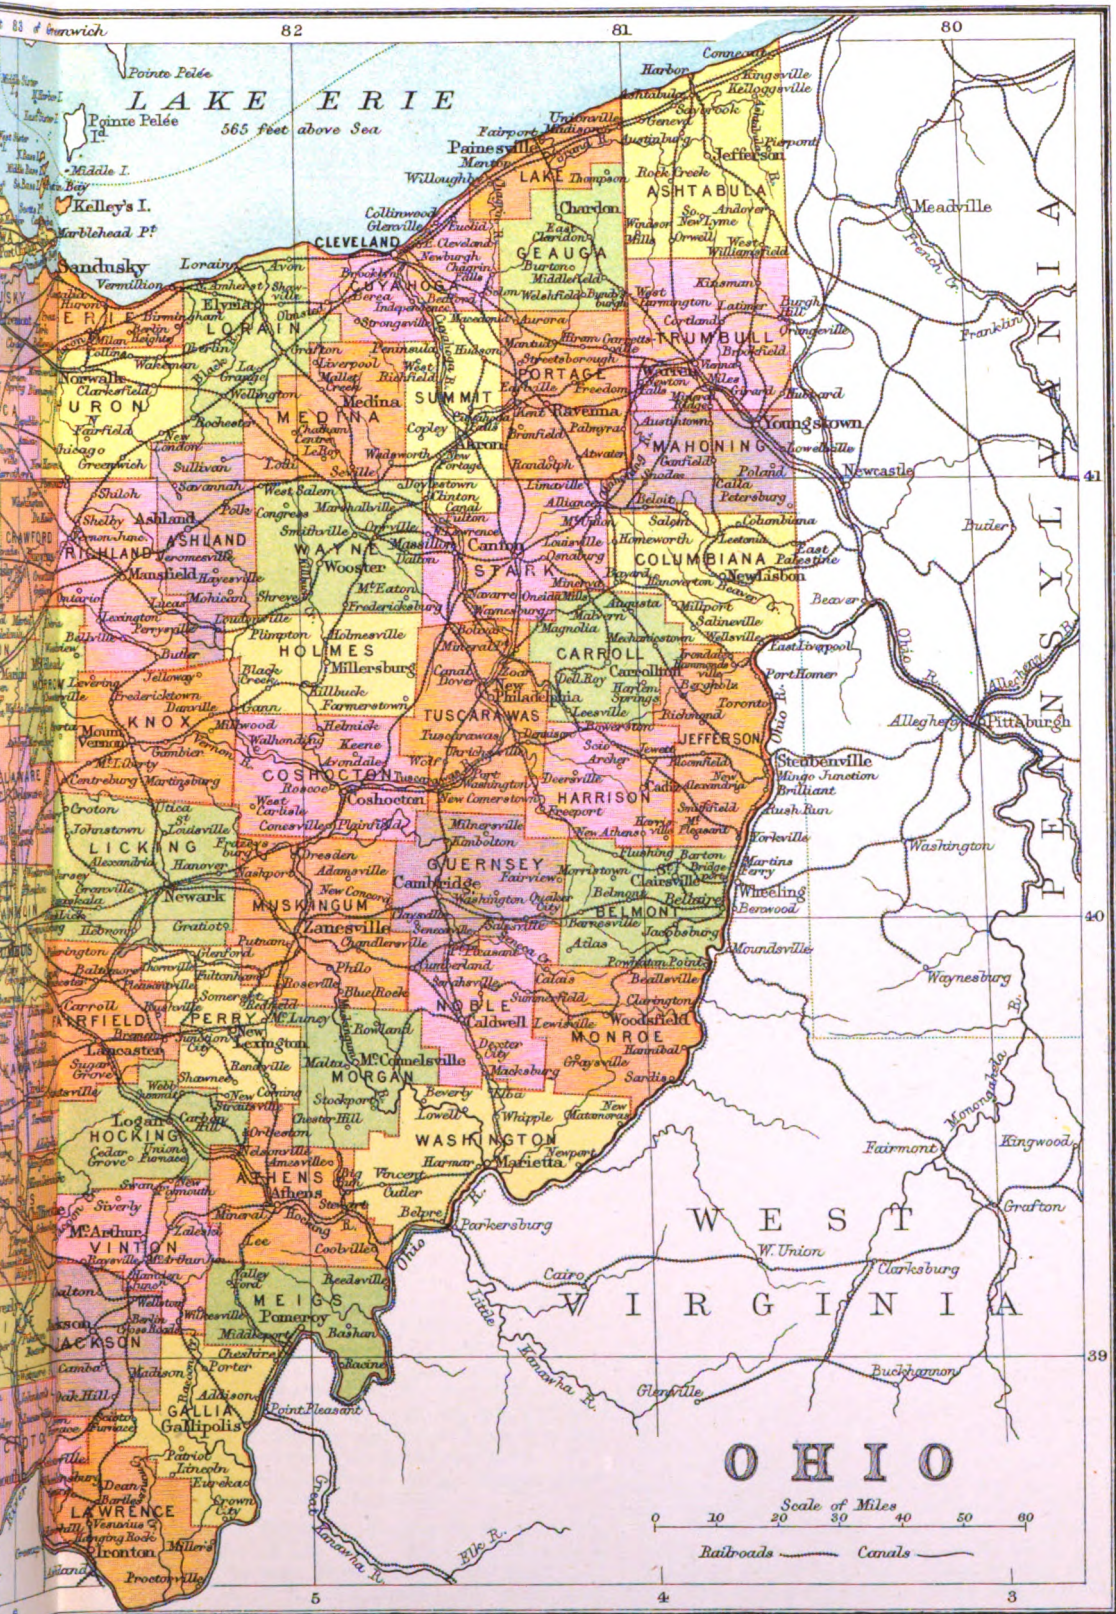

The most comprehensive work on Ogams is Brash's *Ogam-inscribed Monuments of the Gaedhil in the British Islands, with a Dissertation on the Ogam Character* (Lond. 1879); and next to it in point of comprehensiveness must be ranked Sir Samuel Ferguson's *Ogam Inscriptions in Ireland, Wales, and Scotland* (Edin. 1887), which consists of the Rhind Lectures delivered in Edinburgh in 1884. Papers on Ogams will be found in the *Trans. Roy. Irish Acad.*, especially by the Bishop of Limerick, who has also propounded a theory of the origin of Ogmie writing in the *Hermathena*. The journal which has above all others kept its pages open for Ogam finds in Ireland is that of the Royal Hist. Archæo. Assoc. Ireland (originally founded as the Kilkenny Society in the year 1849). Among other things its Journal for 1874 contains tracings made by G. M. Atkinson of old treatises on Ogams, together with explanations, including the theory of the numerical origin of the Ogams for *h*, *d*, *c*, *qu*, which we find to have been contributed by the Rev. Edmond Barry. The Ogams of Wales and Devon will be found in their places in Hübnér's *Inscriptiones Britannicæ Christianæ* (Berlin, 1876). Further, those of the Principality have from time to time been noticed and illustrated in the *Archæologia Cambrensis*, and they will also be found in Westwood's *Lapidarium Walliæ* (Oxford, 1876-79). The Ogams of the Isle of Man have been described in the *Academy* and the *Manx Note-book*; and papers on the Scottish Ogams were read before the Society of Antiquaries of Scotland in the years 1882-84 by the Earl of Southesk after careful examination of the stones. The names in the Ogams of Wales and Devon have been discussed in detail in Rhy's *Lectures on Welsh Philology* (Lond. 1879), and some Ogmie forms have been used for the purposes of Celtic philology by Dr Whitley Stokes in his *Celtic Declension* (Gött. 1886). Lastly, the most important Irish tract on Ogams is to be found in the 15th-century manuscript known as the Book of Ballymote: it occupies folios 306-314 of the autotype edition (Dublin, 1887) of that extensive codex.

Ogasawara. See BONIN.

Ogden, capital of Weber county, Utah, is situated, at an elevation of 4340 feet, at the confluence of the Weber and Ogden rivers, where the former passes through the Wahsatch Mountains, 37 miles N. of Salt Lake City. It is of importance as the place where the Union Pacific and Central Pacific railroads, as well as three others, join. The city contains a Methodist university (founded 1890), a foundry and several mills, breweries, and

PHILADELPHIA: J.

manufactories of woollens, brooms, boots and shoes, &c. Pop. (1880) 6069; (1890) 14,889.

Ogdensburg, a port of New York, on the St Lawrence, at the mouth of the Oswegatchie, opposite Prescott, Canada, and 515 miles by rail NNW. of New York City. Its principal buildings are the Roman Catholic cathedral and the United States government building. The city has a large lake and river trade, and contains a huge grain-elevator and manufactories of flour, lumber, and leather. A steam-ferry plies to Prescott. Pop. (1890) 11,662.

Ogee, Ogive. Ogive is the name given by the French to the pointed arch; and as an English architectural term, ogive ribs are the main ribs which cross one another at the intersection of the vaulting. Ogee, a form of the same word, is applied to a compound curve, made up of a convex curve continued by a concave one. Ogival work is common in the Decorated Style (q.v., fig. 3), and may be seen in the tracery of the Flamboyant (q.v.). The ogee moulding is that also called *Cyma reversa*, illustrated at MOULDING. The French word is from the Spanish *auge*, and that from the Arabic *awj*, 'summit,' 'vertex.'

Ogier le Danois. See CHANSONS DE GESTES.

Oglethorpe, JAMES EDWARD, founder of Georgia, was born in London, 21st December 1698, the son of Sir Theophilus Oglethorpe, of Godalming in Surrey. After studying awhile at Oxford he joined the Guards before he was twenty, and served on the Continent with Prince Eugene. From 1722 to 1754 he represented Haslemere in parliament. Meanwhile he projected a colony in America, where the debtors then languishing in English gaols might start life afresh, and which should be also a refuge for the persecuted German Protestants (see SALZBURG). Parliament contributed £10,000, George II. gave a grant of the necessary land, after him called Georgia; and in 1733 Oglethorpe went out with a company of 130 persons and founded Savannah. In 1735 he took out 300 more, including the two Wesleys; and in 1738 he was back again with a regiment of 600 men, raised in anticipation of a war with Spain, from whose neighbouring colony of Florida he had already received annoyance. War was declared by the mother-countries in 1739, and in 1741 Oglethorpe invaded Florida and unsuccessfully attacked St Augustine (see his own account, published 1742); the next year he repulsed a Spanish invasion of Georgia. In 1743 he left the colony for the last time, to meet and repel before a court-martial the malicious charges of one of his own officers. He was again tried and acquitted after the Forty-five for having failed, as major-general, to overtake Prince Charles's army. The charter of his colony he surrendered to the British government in 1752. His later years were spent at Cranham Hall, his seat in Essex, where he died 30th January 1785. His intimate friends included many of the most eminent men of the day. Pope's couplet is well known:

Or driven by strong benevolence of soul,
Will fly, like Oglethorpe, from pole to pole.

Dr Johnson urged him to write his life, and even offered to do it himself; and Boswell made a few, but insufficient, notes with the same object.

See *Lives* by Harris (Boston, 1841), Wright (Lond. 1867), and Bruce (New York, 1890).

Ogowé, or OGOWAY, a river of West Africa, has its origin on the west side of the watershed that parts its basin from that of the Congo, in 2° 40' S. lat., 14° 30' E. long., flows north-west, west, and finally curves round by the south so as to pour its waters into Nazareth Bay, on the north side of Cape Lopez. It forms a wide delta of some 70 sq. m. in extent. In the dry season (July to Sep-

tember) it shrinks to a narrow current winding between the rocky obstructions of its bed; at other times it is a deep, broad stream, navigable by boats; numerous islands and sandbanks and shallows prevent vessels of any size from ascending. It has been dominated by France, through her colony on the Gaboon (q.v.), since 1885.

Ogy'ges, the earliest legendary king of Attica and Boeotia, in whose time a great flood took place called the Ogygian Flood.

Ogygia, a genus of Trilobites (q.v.), peculiar to the Lower Silurian system.

O'Hara, THEODORE, author of 'The Bivouac of the Dead,' was born at Danville, Kentucky, in 1820. He was a lawyer and journalist, but served as captain and major in the Mexican war, afterwards, for a year, in the United States cavalry, and in the civil war as a colonel on the Confederate side. He died in 1867. See monograph by Ranck (Baltimore, 1875), and the *Century* (May 1890).

O'Higgins. See CHILL.

Ohio, a river of the United States, called by the French explorers, after its Indian name, *la Belle Rivière*, next to the Missouri the largest affluent of the Mississippi, is formed by the union of the Alleghany and Monongahela at Pittsburgh, Pennsylvania, and flows west-south-west 975 miles, with a breadth of 400 to 1400 yards, draining, with its tributaries, an area of 214,000 sq. m. In its course it separates the northern states of Ohio, Indiana, and Illinois from the southern states of West Virginia and Kentucky. The principal towns upon its banks are Pittsburgh, Wheeling, Cincinnati, Louisville (where there are rapids of 22 feet in a mile, with a steamboat canal), Evansville, New Albany, Madison, Portsmouth, Covington, and Cairo. The river's principal affluents are the Tennessee, Cumberland, Wabash, Kentucky, Great Kanawha, Green, Muskingum, and Scioto. It is usually navigable from Pittsburgh.

Ohio, the fourth in population of the states of the American Union, lies between 38° 25' and 42° N. lat. and 80° 30' and 84° 50' W. It stretches from north to south 210 miles, and from east to west 220 miles; the northern and southern and much of the eastern boundaries are irregular. Area, 39,964 sq. m., or equal to that of Ireland and Wales together. Ohio is a part of the original North-west Territory, chiefly claimed by Virginia under charters granted by the English kings, which territory became a corporate body soon after the formation of the Virginia colony; and when that colony became a state, the territory, with undefined northern limits, became a county. Ohio was the first state created within the territory, of which it comprises much of the best part. It is watered on the north by Lake Erie, and on much of the east and all of its southern boundary by the Ohio River, from which it derives its name.

The face of Ohio, taken as a whole, presents the appearance of an extensive, monotonous plain. It is moderately undulating, but not mountainous; in many places streams have forced a way through bold cliffs of sandstone. A low ridge enters the state near the north-east corner and crosses it in a south-westerly direction. This 'divide' separates the waters of Lake Erie and the Ohio River, and maintains an average elevation of a little over 1300 feet above sea-level. North of this ridge the surface of the country is generally level, gently declining toward the lake. The central part of Ohio is almost a level plain, about 1000 feet above the sea, slightly inclining southward. The southern part is somewhat hilly, the valleys growing deeper as they approach the Ohio River, whose tributaries here water many extensive and fertile

valleys. There are a few prairies or plains in the north-western parts of the state, but over its greater portion originally existed immense quantities of timber. The principal rivers draining southward to the Ohio are the Muskingum, Scioto, Great Miami, and Little Miami. Northward to the lake are the Tuscarawas, Cuyahoga, Sandusky, Huron, and Maumee, all but the last named being entirely in the state.

The rocks underlying Ohio belong to the Silurian, Devonian, and Carboniferous systems. The general arrangement of the geological formation shows a layer of sheets resting in the form of an arch from Lake Erie to the Ohio River. The limestone (No. 4) midway in the state is unbroken, and stretches from side to side; the Oriskany, the Corniferous, the Hamilton, and Huron formations, though generally removed from the crown of the arch, still remain over a limited area near the central portion. On the side of the great anticlinal axis the rocks dip downward into a basin, which for several hundred miles, north and south, occupies the interval between the Nashville and Cincinnati ridge and the first fold of the Alleghany Mountains. As they dip toward the centre of this trough, on the eastern and southern border of the state, the older rocks are deeply buried, and the surface is here underlaid by the Alleghany coal-measures; while in the north-western part of the state the strata dip northward and pass in the same way under the Michigan coal-basin. The coalfields of Ohio cover over 12,000 sq. m., the beds estimated to average 15 feet in thickness. Immense deposits of limestone, freestone, and mill-stones abound.

Archæologically Ohio is the richest field in America. In no other state have been found so many evidences of man's antiquity exemplified in implements of stone, bone, copper, and clay; while the most extensive and elaborate systems of earthworks in America are at Newark, near Chillicothe, and on the Miami bluffs near Waynesville. See MOUND-BUILDERS.

Ohio is one of the chief manufacturing states in the Union, leading all others in the manufacture of farm machinery, carriages and wagons, woollen and cotton goods, furniture, and wine and spirits. It has also great rolling-mills and iron-factories, glass-factories, potteries, and oil-works. In agriculture the state is first in the Union in many regards. Its annual production of maize is some 90,000,000 bushels, of wheat 40,000,000, of wool over 20,000,000 lb. Cattle and hogs are reared in large numbers. Ohio is a leading pork-producing state. The oil-fields, prevailing largely in the north-west, are being rapidly developed, and already the output is second only to that of Pennsylvania. Natural gas has been found in immense quantities, but at the present rate of consumption is soon exhausted.

History.—In 1787 the Ohio Company of Associates was organised in New England by those who had served in the war of the revolution, and under their auspices a large tract of land was purchased from the government in the territory north-west of the Ohio River, payment being made in 'Continental Certificates' issued to the soldiers for their services. This was the first public sale of land by the United States government. In connection with its sale the famous 'Compact' or 'Ordinance of 1787' was passed, guaranteeing for ever in the territory civil and religious freedom, the system of common schools, trial by jury, and the right of inheritance. In 1788 Marietta and Cincinnati were founded, and till 1791 settlements in the southern part of the territory increased rapidly. In that year the Indians became troublesome, owing to the continual encroachments of the whites, and an army under the governor suffered a disastrous

defeat. In November 1794 a signal victory was gained by General Anthony Wayne over the Indians at 'Fallen Timbers' on the Maumee River. The year after a treaty of peace was concluded at Fort Greenville, the Indians ceding a great portion of territory, which settlers began at once to fill, and the towns of Xenia, Dayton, Hamilton, Chillicothe, Zanesville, Franklinton, and others were established. Chillicothe was made the seat of government for the territory, and a capitol building erected. In 1802 a constitution was adopted for the 'Eastern Division of the Territory North-west of the Ohio,' to be known as 'Ohio,' and on 19th February 1803 Ohio was formally admitted into the Union. By 1810 its population was 230,760, and the increase from that period was rapid. As early as 1812 steam-boat navigation up and down the Ohio River was accomplished; by 1834 there were, as now, 709 miles of canal in operation; and the Mad River Railroad, begun in 1837, was opened for traffic in 1842, and completed to the lakes by 1848; in 1890, 7797 miles of railway traversed the state, not counting double tracks, &c. Ohio has given four presidents to the Union—Grant, Hayes, Garfield, and Benjamin Harrison.

Ohio is divided into 88 counties, and returns 21 members to congress. The justices of the supreme court are elected for terms of five years by the people. There are now 18,751 elementary and high schools, 44 academies of various kinds, 19 professional and art schools, and 34 colleges and universities. The ratio of illiteracy is less than the average of other states. The largest cities are Cincinnati, Cleveland, Columbus (the capital), Toledo, Sandusky, Dayton, Springfield, Steubenville, Portsmouth, Akron, Youngstown, and Canton. The total taxable value of real and personal property in 1890 was \$1,778,138,477. Pop. (1850) 1,980,329; (1870) 2,665,260; (1880) 3,198,062; (1890) 3,672,316.

Ohlau, a town of Prussian Silesia, 20 miles SE. of Breslau by rail, on the Oder. Pop. 8575.

Ohm, GEORG SIMON, physicist, born at Erlangen, 16th March 1787, became in 1849 professor at Munich, and died there 7th July 1854. For Ohm's Law and the *ohm* as a measure of electric resistance, see ELECTRICITY, Vol. IV. p. 267.

Ohnet, GEORGES, a French novelist of great popularity, if not merit, born 3d April 1848 at Paris. He studied law, and after practising some time as an advocate took to journalism, and later to literature proper. Under the general title of *Les Batailles de la Vie* he has published a series of novels dealing comprehensively with social questions, some of which have actually reached a hundredth edition. The first in this cycle of romances was *Serge Panine* (1881), too quickly followed by *Le Maître de Forges* (1882), *La Comtesse Sarah* (1883), *Lise Fleuron* (1884), *La grande Marinière* (1885), *Les Dames de la Croix-Mort* (1886), and *Volonté* (1888).

Oïdium, or ERYSIPE, a genus of minute fungi infesting various plants, and especially important as the cause of a ravaging disease of the vine, popularly known as vine-mildew. The disease was first observed in Kent in the spring of 1845; it spread rapidly over the English vineries, and was observed about the same time in the vineries of Paris, and soon afterwards in those of nearly all parts of France, Italy, Greece, Tyrol, and Hungary, and in a less degree in the Rhine valley. Its ravages extended to Algeria, Syria, Asia Minor, and especially to the island of Madeira, where it nearly put an end to the production of the celebrated wine. The disease appears first in the leaves, these drop off, the plant loses strength

through impaired nutrition, the young shoots fall victims, and lastly the grapes. Powdered sulphur was found useful as a cure, but the applications had to be very frequent; in consequence of its importance the duty of sulphur was reduced by the French government. It is probable that in this case, as in all diseases of the sort, the general vitality of the organism must be lowered before it will fall a victim. Over-cultivation and long use of the same ground are predisposing causes.

Oil-beetle, a name given to beetles of the Meloe and allied genera, which when disturbed emit a yellowish oily liquor from the joints of their legs. Some species are used as vesicants instead of cantharides.

Oil-bird. See GUACHARO.

Oil-cake is used mainly for feeding sheep and cattle. It is made from the solid residue of oleaginous seeds (linseed, rape-seed, cotton-seed), after a large proportion of their oil has been extracted. The following is the usual process of manufacture in Britain. The seed is crushed between iron rollers, then damped and ground upon a mill of the following construction. Two large circular blocks of hard granite are set edgewise on a bed-stone of the same material, which is slightly hollowed out; these two upright stones are connected by a horizontal shaft which passes through the centre of both, and is fixed at its middle to a revolving upright shaft. The stones are thus made to revolve about their vertical axes, while at the same time they are left free to be turned round the horizontal shaft by the friction of grinding. The meal thus obtained is heated in kettles formed of two compartments, in the inner of which the meal is placed, while the outer is filled with steam. The meal is then filled into small woollen bags of the shape it is wished to make the cakes—usually oblong, about 30 inches by 12 inches, and $\frac{1}{2}$ to $\frac{3}{4}$ inch thick. These bags are then placed in wooden 'wrappers,' which consist of two pieces of hard wood, of the same size as the cakes, hinged together at the end; the wood is usually corrugated and furnished with a stamp to mark the cakes. The wrappers containing the bags full of crushed seed are then placed in the compartments of a press worked on the same principle as a Hydraulic Press (q.v.), except that the oil from the seed is used instead of water. In this way about 90 per cent. of the oil the seed contains is squeezed out of it, leaving sufficient to bind the residue of ground husks into a solid firm cake. Sometimes the process is varied, in that the seed, instead of being ground under stones, is repeatedly crushed on iron rollers; in this case the crushed seed is steamed in the kettles to give the necessary moisture, not merely heated as described above. Sometimes oil-seeds are subjected to a chemical instead of a mechanical process—viz. solution of the oil in bisulphide of carbon. By this means the oil may be almost completely extracted. Mustard, rape, castor-oil, undecorticated cotton-seed cake, and some others are also used as fertilisers.

Oil City, Pennsylvania, on both sides of the Alleghany River (here crossed by long railroad and passenger bridges), 133 miles by rail N. by E. of Pittsburgh, is one of the principal oil markets in the state, and the centre of a busy trade. It contains, besides oil-refineries, engine- and boiler-factories, and a large cooperage. Pop. (1870) 2276; (1880) 7315; (1890) 10,932.

Oil Rivers. See NIGER.

Oils (including Fats). The fats and fixed oils constitute an important and well-marked group of organic compounds, which exist abundantly both in the animal and vegetable kingdoms. They are not simple organic compounds, but each of them is a mixture of several such compounds to which the term *glycerides* is applied; and the glycerides which by their mixture in various proportions form the numerous fats and oils are mainly those of palmitic, stearic, and oleic acids, and to a less extent those of other fatty acids, such as butyric, caproic, caprylic, and capric acids, which are obtained from butter, myristic acid, which is obtained from coconut oil, &c. The members of this group may be solid and hard, like suet; semi-solid and soft, like butter, horse-grease, and lard; or fluid, like the oils. The solid and semi-solid are, however, usually placed together and termed fats, in contradistinction to the fluid oils. The most solid fats are readily fusible, and become reduced to a fluid or oily state at a temperature lower than that of the boiling-point of water. It is not until a temperature of between 500° and 600° F. is reached that they begin nearly simultaneously to boil and to undergo decomposition, giving off acrolein (an acrid product of the distillation of glycerine) and other compounds. In consequence of this property these oils are termed *fixed oils*, in contradistinction to a perfectly separate group of oily matters, on which the odoriferous properties of plants depend, and which, from their being able to bear distillation without change, are known as *volatile oils*. These, which are also known as *essential oils*, differ *in toto* in their chemical composition from the compounds we are now considering. All the fats and oils are lighter than water, and are perfectly insoluble in that fluid. Their specific gravity ranges from about 0.91 to 0.94. They dissolve in ether, oil of turpentine (one of the volatile oils), benzol, and to a certain extent in alcohol; while, on the other hand, they act as solvents for sulphur, phosphorus, &c. These bodies possess the property of penetrating paper and other fabrics, rendering them transparent, and producing what is well known as a greasy stain. They are not readily inflammable unless with the agency of a wick, when they burn with a bright flame. In a pure and fresh state they are devoid of taste and smell, but on exposure to the air they become oxidised and acid, assume a deeper colour, evolve a disagreeable odour, and are acid to the taste; or, in popular language, they become *rancid*. The rapidity with which this change occurs is considerably increased by the presence of mucilaginous or albuminous bodies. The rancidity may be removed by shaking the oil in hot water in which a little hydrated magnesia is suspended.

The general diffusion of fats and oils in the animal kingdom has been already described (see FATS). In the vegetable kingdom they are equally widely distributed, there being scarcely any tissue of any plant in which traces of them may not be detected; but they are especially abundant in the seeds. The seeds of the Cruciferae are remarkably rich in oil; linseed yielding fully 20 per cent., and rape-seed about 40 per cent. of oil; and some fruits, as those of the olive and oil-palm, yield an abundance of oil.

The uses of oils and fats are numerous and highly important, many being extensively employed as articles of food, as medicines, as lubricating agents, in the preparation of soaps, ointments, varnishes, pigments, for candles, lamps, and other means of illumination, and for the purpose of dressing leather, &c. In Africa, Asia, and the Pacific animal and vegetable oils and fats are much used for anointing the person and smearing the hair, thus affording a protection against heat

and the attacks of insects, and checking excessive perspiration. This practice conduces to health and preserves the skin smooth and soft. Oil thrown on the sea has a remarkable effect in subduing the force of the waves. A few gallons cast upon stormy seas moderates and prevents the waves breaking with force. This practice might be adopted by lifeboats when approaching wrecks, and rescuing the crews of stranded vessels. The composition of the fine oils required for watches and sewing-machines is often carefully kept secret. Those principally used are ben, almond, olive, and neat's-foot. The oils suitable for machine-shops and general cotton and woollen machinery require a good body, rather viscid. For woollen spindles a lighter oil, and for cotton spindles, which have a speed of 4000 revolutions per minute, an oil of still lighter body. For lubricating purposes mineral oils may with advantage be mixed with animal and vegetable oils to diminish their tendency to thicken; the more fluid an oil is the less friction takes place.

(1) *Vegetable Fats*.—The chief solid fats of vegetable origin are cocoa-nut oil, nutmeg-butter, cocoa-butter, and palm-oil. The fluid vegetable fats or oils are divisible into the *non-drying* and the *drying oils*; the latter being distinguished from the former by their becoming dry and solid when exposed in thin layers to the air, in consequence of oxygenation. Some of the drying oils, when mixed with cotton, wool, or tow, absorb oxygen so rapidly, and consequently become so heated, as to take fire, and many cases of the spontaneous combustion of heaps of oily materials that have been employed in cleaning machinery have been recorded. The chief non-drying oils are olive-oil, almond-oil, and colza-oil; while the most important drying oils are those of linseed, hemp, poppy, and walnut; castor-oil seems to form a link between these two classes of oils, since it gradually becomes hard by long exposure to the air.

(2) *Animal Fats*.—The chief solid fats are beef and mutton suet or tallow, lard, butter, goose-grease, &c.; while among the fluids sperm-oil, ordinary whale-oil, cod-liver oil, and neat's-foot oil may be especially mentioned. In many of their characters spermaceti and beeswax resemble the solid fats. As a general rule, stearin and palmitin, both of which have comparatively high fusing-points (between 167° and 114° F.), preponderate in the solid fats; while olein, which is fluid at 32°, is the chief constituent of the oils.

When any of these bodies are heated with the hydrated alkalies they undergo a change which has long been known as Saponification, or conversion into Soap (q.v.), in which the fatty acid combines with the alkali to form a *soap*, while the sweet viscid liquid glycerine is simultaneously formed. When the fatty acids are required on a large scale, as for the manufacture of the so-called stearin candles, which in reality consist mainly of stearic and palmitic acids, sulphuric acid and the oil or fat are made to act upon each other at a high temperature (see CANDLE). The fatty acids may also be procured in a very pure form by the injection of superheated steam at a temperature of between 500° and 600° into heated fat. A complete list of even the chief fats and fixed oils would take up far more space than we can command. The more important are noticed in separate articles, such as Fixed Oil of Almonds, Castor-oil, Croton-oil, &c., and some account given of their properties and uses; or under the names of the substances from which they are procured—Linseed, Rape, Candle-nut, Cocoa-nut, Cotton (for Cotton-seed Oil), &c. Reference may also be made to the articles on Butter, Ghee, Lard, Cod-liver Oil, &c.

The *Volatile* or *Essential Oils* exist, in most

instances, ready formed in plants, and are believed to constitute their odorous principles. They form an extremely numerous class, of which most of the members are fluid. Many used for flavouring are artificially compounded (see BUTYRIC ACID). Essential oils are much employed in perfumes, for flavouring liqueurs and confectionery, and for various purposes in the arts. They will be described at PERFUMERY. The *mineral oils* will be found discussed under the heads of Naphtha, Paraffin, Petroleum.

OILS IN THEIR COMMERCIAL RELATIONS.—

Vegetable Oils.—The principal seeds imported for expressing oil are cotton, linseed, rape, and ground-nut; but many others are received in small quantities. *Cotton-seed* is now a very important product, which was formerly much neglected. The imports into Britain rose from about 20,000 tons in 1861 to over 314,000 tons in 1890, nearly all coming from Egypt: 100 lb. of seed yield about 2 gal. of oil. The seed fetches £5 to £6 a ton; the oil £18 to £21 a tun. *Linseed*.—British imports of this flax-seed now reach over 2,000,000 qr., of the value of £4,000,000. Nearly all the supply used to be obtained from Russia, which produces the best seed, but now the chief imports are from India; these arrive, however, very much mixed with rape and other seeds. India ships about 8½ million cwt. of linseed yearly, of which three-fourths is sent to England. One quarter of linseed will yield by pressure 120 lb. of oil and 2½ cwt. of oil-cake. The average annual production of linseed-oil in the United Kingdom may be taken to be about 120,000 tuns. India is the chief source of supply for the small oil-seeds, the value of those exported annually ranging from £9,500,000 to £10,750,000, besides about £500,000 more for the oils of various kinds shipped. Africa alone supplies palm-oil and large quantities of ground-nuts; Ceylon, India, and the Pacific islands the cocoa-nut oil of commerce. *Cocoa-nut Oil* is expressed from the albumen or ripe kernel of the nut, known in commerce when dried as copra. The production of this oil does not make the same progress that palm-oil does, as the following decennial imports into the United Kingdom will show: 1870, 198,602 cwt.; 1880, 318,454 cwt.; 1890, 184,409 cwt. The price of the oil declined about £10 in 1883-90, the price being in the latter year £27 per ton. *Palm-oil*.—The average imports of this oil are 50,000 tons annually. Prices have advanced of late years, and in 1890 stood at £26 per ton. This oil forms a chief ingredient in the grease used for railway axles. *Rape-seed*.—The imports of rape range between 459,000 to 2,300,000 qr., of which about half come from Russia and half from India. The total exports of this seed from India now exceed 3 million cwt., valued at nearly £2,000,000 sterling; the great bulk of this is sent to France and Belgium. From the first pressure rape-seed will yield about 90 lb. of oil per quarter, and from a second pressure 60 to 70 lb. The *Ground-nut* (*Arachis hypogæa*) is now a large source of oil-supply, but the principal commerce and manufacture centre at Marseilles. It is principally cultivated on the west coast of Africa, but is now much grown in India. The price of the shelled kernels in the London market is from £11 to £13 per ton. *Olive-oil* used to be one of the most valuable vegetable oils used for food, but it is now much adulterated with or replaced by Gingelie and cotton-seed oils. The average imports are about 20,000 tuns, the best Spanish fetching £37 per tun. For lubricating and woollen manufactures olive-oil has been largely replaced by other vegetable oils and lard-oil (see OLIVE). *Gingelie* or *Til-oil* is the produce of the seed of *Sesamum indicum*, which yields about 50 per cent. of oil; and

the annual export of this seed from India is from 1½ to 2½ million cwt. It goes principally to France and Italy. The price is 40s. to 50s. the 384 lb. *Poppy-seed*.—The trade in this seed from India is a fluctuating one, ranging from 450,000 to 730,000 cwt.; the exports are chiefly to France and Belgium. The seeds yield 45 per cent. of oil, which is used for culinary purposes. The seed sells at about 43s. the bag of 388 lb. *Castor-oil seed*.—From 600,000 to 700,000 cwt. of this seed are exported annually from India, and 2,000,000 to 2,600,000 gal. of the castor-oil. The expression of the oil is chiefly carried on in Italy and America, besides India. The various species of *Bassia* of India and Africa yield good oils, some of which are semi-solid and esteemed for soap-making. Under the name of *Mahwa* about 100,000 cwt. are shipped from India (see BUTTER-TREE).—One or two species of *Aleurites* produce what are known as candle-nuts in commerce; these yield 50 per cent. of oil. Some species of *Garcinia* yield kokum-butter, which is used as a substitute for ghee or clarified butter by the poorer classes of India. Many species of nuts, such as the Brazil, hazel, walnut, and others, yield oil which is used locally, but does not enter largely into commerce. In China oil is obtained from the Soy bean (*Soja hispida*), and it yields about 18 per cent. of a drying oil. The bean-cake is employed for feeding men and animals, and is also largely used for manure. Another oil made there is from the seed or fruit of the *Camellia oleifera*. It is of remarkable purity, of an amber colour, and possesses a pleasant taste. In the United States corn or maize oil and pea-nut oil are manufactured, as well as cotton-seed oil, linseed-oil, and castor-oil. The cocoa seeds or beans of commerce contain from 18 to 20 per cent. of a concrete fat, which being separated in the preparation of cocoa and chocolate, throws a large amount of cocoa-butter on the market. Several thousand tons of it in flattened cakes are now sold annually in London and Holland. It is used for pharmaceutical purposes and confectionery. Nutmeg-butter, Galam butter (*Bassia*), Carapa, Carnauba, and certain vegetable tallow and waxes partake of this solid character.

Animal Oils.—The principal solid animal oils found in commerce are butter and lard, tallow, mares' grease, neat's-foot oil, and unrefined yolk of egg oil. The first two are fully described under their names. Tallow is the fat of oxen and sheep, but more especially the fat which envelopes the kidneys and other parts of the viscera, rendered down or melted. The qualities of this solid oil make it particularly well adapted for making candles, and until the end of the first quarter of the 19th century candles for ordinary use were almost wholly made of it. Britain obtains probably about 60,000 tons of tallow yearly at home, and receives as much from abroad, chiefly imported from North and South America and Australia. Russia used to furnish the chief supply, but the pastoral progress in the new countries has quite changed the sources of supply of animal fats. The imports of tallow and stearin do not vary greatly from year to year; they were, in 1870, 1,523,298 cwt.; 1880, 1,316,379 cwt.; 1890, 1,385,517 cwt. The value of the last-named year's imports was £1,729,349. The oleins, obtained by pressure from animal fats, are known in commerce as tallow-olein, lard-olein, and neat's-foot oil; they come next in value to sperm-oil. The two former are included under animal oils. Many thousand tons of these oleins are sent from the United States to Europe for artificial butter-making. Besides the home production of butter, which is large (about 130,000 tons), the United Kingdom imported in 1890 over 100,000 tons, valued at £10,500,000,

and 54,000 tons of an artificial compound prepared from tallow, chiefly in Holland, and which has to be labelled as 'margarine' when sold; for this more than £3,000,000 is paid (see BUTTERINE). Of lard-oil Britain imports 91,000 cwt., besides about 27,000 cwt. of other animal oils, such as mares' grease, tallow-oil, &c. Lard-oil from which the stearin has not been pressed is known as 'neutral oil.' An olein is extracted from beef-suet in the United States, of which there are three qualities. Several thousand tons of this animal oil are sent from Chicago to Holland for the manufacture of oleomargarine. The export of this olein from the United States averages now 30,000,000 lb. yearly, valued at £600,000. *Horse-grease* is received from the River Plate states, where there are over five million horses. The mares, which are never used for the saddle, are annually slaughtered in large numbers in the republics of Uruguay and Argentine. A little horse-grease is also obtained in Britain from the slaughtered horses, 400 to 500 dying weekly in London alone. They furnish about 28 lb. of grease each, which is valuable as a lubricant. *Neat's-foot oil* is obtained in boiling down the feet of cattle. It does not turn rancid, and remains fluid at 32°. When part of its stearin has been abstracted it is used for oiling church and steeple clocks (as it does not solidify), for softening leather, and other purposes. In North America, where swine are bred so largely, the melted fat of the pig is a very important secondary product. The United States, with its 50 million pigs, sends away lard to the value of £5,500,000 yearly. It is a very important food-product, and in the West Indies it is much used instead of butter. The imports of lard from America into Britain now average 60,000 tons yearly, of the value of £2,000,000. The imports increased fivefold in 1870-90. Another animal fat is the suint obtained in the process of washing wool. This potassic sudorate forms no less than a third of the weight of raw wool in the grease.

Marine oils are obtained from various mammals and fishes in different localities. Much of the oil obtained passes under the general name of 'train-oil.' The whale-fishing has been much abandoned of late years by the nations which formerly pursued it; but the seal-fishing, which is less precarious and hazardous, is extensively prosecuted. The value of the oil shipped from Newfoundland annually exceeds £100,000. The average value of the fish-oil imported into Britain is only about £420,000; about 1880 it used to be double that amount. In America and the north of Europe fish oils are principally obtained from the liver of the cod and shark, from the dogfish, porpoise, Menhaden (q.v.), pilchard, herring, sardine, and other Clupea. In the Mediterranean the tunny yields a large quantity of oil, extracted by boiling, often in sea-water. It is of a pale amber colour and an agreeable flavour.

Fish oils are often confounded with the oils obtained from the blubber of the whale, seal, and other marine mammals, and their oil is much mixed with these. The great trade in animal oils and fatty substances indicates the care with which oily matters rich in carbon and hydrogen are sought for, supplying as they do a great number of wants in countries the most civilised as well as among people still in their primitive state. Some of these oleaginous substances are employed as food by man, some in manufactures, and others in medicine. The fish oils are usually thick, with a strong odour, and of different colours, according to quality and preparation, ranging from white to blonde and brown. In northern countries they still serve for illumination, but of late years have been largely superseded in this use by gas, petroleum, and

electric lighting. Fish oils are valuable for soap-making and also much employed by curriers for dressing leather; and the oil is again recovered and sold for further use under the name of *degras* and *sod-oil*. Sharks are largely caught off the Norway coast and in the Indian seas, chiefly for their oil. In Greenland 300 or 400 are taken every season, their livers yielding 2500 barrels of oil, which is much valued for lubricating. *Spermaceti*, or 'head matter,' as it is commercially termed, from the oil being principally found in the enormous head of *Physeter macrocephalus*, has, like whale-oil, been declining largely of late years. Britain only receives some 1430 tuns, valued at £56,325, against three times that quantity imported about the year 1880. It used to be much employed in candle-making, mixed with about 5 per cent. of beeswax to prevent crystallisation (see WHALE). *Seal-oil* is hence included with train or fish oil. The exports from Newfoundland range from 3500 tuns to 6000 tuns yearly, according to the catch of seals. In 1889 Great Britain imported from that island 7000 tuns of oil, valued at nearly £67,000. There was a large decline—fully 50 per cent.—in the prices of fish oils in the years 1889-90. The current prices in 1890 per tun of 252 gallons were, for sperm, £45 to £46; whale-oil, £21 to £23; pale seal-oil, £24 to £26; and cod-oil, £22. The medicinal cod-liver oil realises higher prices. Fuller information on the preparation of these will be found under the various heads. In 1878 the British imports of fish oils of all kinds were 20,656 tuns, valued at £810,891; in 1890, 20,302 tuns received were only valued at £419,296. In various quarters a considerable quantity of oil is obtained from different birds, such as the fulmar, the penguin, puffins, and species of *Procellaria*, the Guacharo (q.v.), the goose, ostrich, emu, and rhea, the passenger pigeon, and others; but, with the exception of penguin-oil from the Falklands, none of these appear to any extent in commerce, and are only used locally.

The large and growing importance of the oil trade is manifest from a consideration of the statistics of imports and exports alone in a year, independent of the various industries and labour interested therein. Taking the English Board of Trade figures for 1889, we find that the value of the imports of animal oils and fats, including butter, lard, tallow, &c., amounted to £18,395,518, the vegetable oils to £3,718,074, the mineral oils to £2,963,834, and the nuts and seeds imported for expressing oil to £8,269,678, making a total of £33,347,104. The imports are nearly all used in Britain, the re-exports being merely to the value of £3,531,242. If to this we add the £1,701,106 for oil-seed cake imported, and the export of oil, soap, and candles of British manufacture, amounting to £2,507,095, we have a total capital involved in the trade of over £37,500,000, and this quite irrespective of the home production of tallow, butter, fish oils, and the like.

Oil-wells. See BAKU, PENNSYLVANIA, PETROLEUM.

Oinomania. See DIPSO MANIA.

Ointments are fatty substances intended to be applied to the skin by rubbing in, and having the consistence of butter. The material employed as a basis for the ointment varies considerably, and as a rule the activity and action are entirely due to the substance incorporated with the basis. The most generally used basis is lard, either alone or mixed with wax, &c., to give it more consistence. To avoid rancidity the lard is usually melted previously with gum-benzoin, and is then known as *benzoated lard*. Although lard is readily absorbed by the skin, yet in this respect it is surpassed by sheep's wool fat and Oleic Acid (q.v.). The former

of these, when incorporated with water, forms an excellent ointment base, smooth, and in every way suitable. So also some of the unctuous oleates are used with great advantage. Soft paraffin, known in commerce under a number of names, has also been used for ointments and does not turn rancid, but on the whole its use is not extending. As nearly all substances may be made into ointments, there is no limit to their number, but perhaps the best known are Zinc Ointment (q.v.), Boracic Ointment, and the Red and White Precipitate Ointments (see PRECIPITATE OINTMENT). In all cases the greatest care is required to ensure that the active principle is rubbed perfectly smooth with a small quantity of oil or lard before adding the bulk of the ingredients, otherwise the production of a homogeneous ointment free from grit is impossible. See COLD CREAM.

Oise, a department in the north of France, separated from the English Channel by Seine-Inférieure; area, 2261 sq. m.; pop. (1881) 404,555; (1886) 403,146. The principal rivers are the Oise, a tributary of the Seine, 150 miles in length, with the Aisne and Therain, affluents of the Oise. The soil is in general fertile, and agriculture advanced. The products are the usual grain-crops, with an immense quantity of vegetables, which are sent to the markets of the metropolis. There are extensive iron manufactures; porcelain, paper, chemicals, beet-root sugar, woollens, cottons, and lace (at Chantilly) are also made. The department is divided into the four arrondissements of Beauvais, Clermont, Compiègne, Senlis; capital, Beauvais.

Oka, an important navigable river of central Russia, the principal affluent of the Volga from the south, rises in the government of Orel, and flows in a generally north-east direction, and joins the Volga at the city of Nijni-Novgorod, after a course of 706 miles. Its basin comprises the richest and most fertile region of Russia. The principal towns on its banks are Orel, Bielev, Kaluga, Riazan, and Murom; the most important affluents are the rivers Moscow, Kliasma, and Tzna. During spring the Oka is navigable from Orel to the Volga; but in summer the navigation is obstructed by sand-banks.

Okavango. See NGAMI.

Okeechobee, a lake of Florida (q.v.).

Oken (originally Ockenfuss), LORENZ, naturalist, was born at Bohlsbach, in Baden, August 1, 1779. He studied at Würzburg and Göttingen; became extra-ordinary professor of Medicine at Jena in 1807; in 1812 he was appointed ordinary professor of Natural Science; and in 1816 he commenced the publication of a journal partly scientific and partly political, called *Iris*, which led to government interference and his resignation. In 1828 he obtained a professorship in the newly-established university of Munich, but in 1832 exchanged it for another at Zurich, where he died 11th August 1851. Oken aimed at constructing all knowledge *a priori*, and thus setting forth the system of nature in its universal relations. His system of natural science is a nature-philosophy, which, though decried as transcendental and a deduction from foregone conclusions, was fertile in suggestive ideas. It was he who wrought out the theory, claimed by Goethe, and now exploded, that the skull is but a modified vertebra.

His principal works are his *Lehrbuch der Naturphilosophie* (1806-11; Eng. trans. 1847), his *Lehrbuch der Naturgeschichte* (3 vols. 1813-27), and *Allgemeine Naturgeschichte* (17 vols. 1833-45). See works on Oken by Ecker (1880) and Guttler (1884), and see Sir Richard Owen's article in the *Encyclopædia Britannica*.

Okhotsk, SEA OF, an extensive inlet of the North Pacific Ocean, on the east coast of Russian Siberia, nearly enclosed by Kamchatka and the Kuriles and Saghalien. It is little navigated. On its northern shore, at the mouth of the Okhota, is the small seaport of Okhotsk, with a pop. of 300.

Oklahoma, a territory of the United States, comprises two detached sections, between which lies a tract known as the Cherokee Outlet. The main portion is bounded W. and S. by Texas, E.

Copyright 1891 in U.S.
by J. B. Lippincott
Company.

and SE. by Indian Territory, from which it is separated by a very irregular line, and N. by Kansas and the Cherokee Outlet, the latter lying between the southern border of Kansas and the parallel 36° 10' N., and extending from the vicinity of the Arkansas River to the 100th meridian. The other portion of the territory is the Public Land Strip situated N. of the Texas 'pan-handle' and S. of the parallel 37° N. This strip, ceded to the United States by Texas at the time of its annexation, was by an oversight not included in any of the adjacent states or territories, and until its incorporation in Oklahoma Territory was known as No Man's Land. The combined area, exclusive of the Cherokee Outlet, is about 35,000 sq. m. The population is 61,384, including 5338 persons in Greer county, situated between the forks of the Red River and claimed by Texas.

The surface, which rises gradually toward the north and west, is for the most part an upland prairie. The most important elevations are the Wichita Mountains in the south. The charms of Oklahoma ('Beautiful Country') have been much overrated. It is fairly well watered by the Red and Arkansas rivers and their affluents, but many of the streams are brackish, and so saturated with alkaline salts as to be at times unfit for drinking purposes or for irrigation. The rainfall is much lighter and also less uniform than in Indian Territory. In the river-valleys and in some of the upland regions there are fertile and productive spots, but much of the region is likely to be subject to the same disappointment which prevails in western Kansas during unfavourable seasons. The Public Land Strip, which constitutes one of the counties of the territory, has an arid and unproductive soil covered here and there with a sparse growth of cactus, yucca, and sage-brush. The climate is generally mild, but subject to sudden changes produced by the 'northers' which are common in this region.

The history of Oklahoma dates from the year 1866, when the tribes to whom the lands of Indian Territory had previously been granted ceded the western portion of their domain to the United States. The land thus acquired was known as the Oklahoma district, but it was agreed that it should be used only for settlement by other Indian tribes or freedmen. Notwithstanding this stipulation western speculators claimed that the lands were the property of the government, and open, like other public lands, for settlement under the Homestead (q.v.) laws. In 1879 an organised effort was made to take forcible possession of the lands, and adventurers from Texas, Kansas, and Missouri, equipped and ready for permanent settlement, invaded the territory. Their action was forbidden by proclamations from President Hayes, and the intruders were finally ejected by United States troops. From this time until his death in 1884, David L. Payne, the leader of the 'boomers,' was repeatedly arrested, but he always evaded punishment and returned to the forbidden land, with the number of his followers augmented. He is said to have received more than \$100,000 in fees from persons who secured from him permission to settle in Oklahoma. After his death the invasions were

continued with even greater pertinacity by his lieutenants. Although the government repeatedly proclaimed the integrity of the treaties with the Indians and enforced them by the authority of the military, negotiations were opened, as a result of which, upon the receipt of an additional sum, the Indians waived all claims to a district in the heart of Indian Territory. This unoccupied area was opened for public settlement on April 22, 1889. No one was allowed to enter the borders until noon, but between that hour and twilight the population was increased by at least 50,000. Claims were selected, town sites staked out, and portable houses erected before nightfall. At Guthrie a bank with \$50,000 capital did a prosperous business during the afternoon. The territory was regularly organised with extended boundaries on May 2, 1890. The relation which the Cherokee Outlet maintains to the territory which exercises jurisdiction over it may be best comprehended by quoting the words of the official act: 'Whenever the interest of the Cherokee Indians in the lands known as the Cherokee Outlet shall have been extinguished and the president shall make proclamation thereof, said Outlet shall thereupon and without further legislation become a part of the territory of Oklahoma.' The territory contains seven counties, of which the county seats and principal towns are Guthrie, Oklahoma City, Norman, El Reno, Kingfisher City, Stillwater, and Beaver.

Okra, a name for the *Hibiscus* (q.v.) *esculentus*.

Olaf, the Saint, one of the most revered of the early Norwegian kings, was born in 995, and after having distinguished himself by his gallant exploits, and made his name a terror in several warlike expeditions on the coasts of Normandy and England, succeeded, in 1015, in wresting the throne of Norway from Eric and Svend Jarl. The cruel severity with which he endeavoured to exterminate paganism by fire and sword alienated the affections of his subjects, who hastened to tender their allegiance to Canute of Denmark on his landing in Norway in 1028. Olaf fled to the court of his brother-in-law, Jaroslav of Russia, who gave him a band of 4000 men, at the head of whom he returned, in 1030, and gave Canute battle at Stiklestad, where Olaf was defeated by the aid of his own subjects, and slain. His body was removed to the cathedral of Trondhjem, where the fame of its miraculous power spread far and wide; and Olaf was solemnly proclaimed patron saint of Norway in the succeeding century. See *Passio et Miracula Beati Olavi*, edited by F. Metcalfe (Oxford, 1881).

Olbers, HEINRICH WILHELM MATTHÄUS, physician and astronomer, was born at Arbergen, a village of Bremen, October 11, 1758, studied medicine at Göttingen from 1777 till 1780, and subsequently practised at Bremen. In 1811 he was a successful competitor for the prize proposed by Napoleon for the best 'Memoir on the Croup.' He became known as an astronomer by his calculation of the orbit of the comet of 1779. He discovered the minor planets Pallas (1802) and Vesta (1807); and in 1781 he had the honour of first rediscovering the planet Uranus. He also discovered five comets in 1798, 1802, 1804, 1815, and 1821, all of which, with the exception of that of 1815 (hence called *Olbers' comet*), had been some days previously observed at Paris. His observations, calculations, and notices of various comets, which are of inestimable value to astronomers, were published in various forms. Olbers also made some

important researches on the probable lunar origin of meteoric stones, and invented a method for calculating the velocity of falling stars. He died at Bremen, 2d March 1840. His correspondence with Bessel was edited by Erman (1852).

Old Bailey, the court or sessions house in which the sittings of the Central Criminal Court are held monthly for the trial of offences within its jurisdiction. The judges of this court are the Lord Mayor, the Lord Chancellor, the judges, aldermen, recorder, and common serjeant of London. But of these the recorder, the serjeant, and the judge of the sheriffs' court are in most cases the actually presiding judges. The judicial sittings here are of such antiquity that all record of their commencement has been lost. Crimes of all kinds, from treason to petty larceny, are tried, and the numbers in past times were enormous, but are now greatly reduced by the extended jurisdiction given to the quarter sessions, and the summary powers granted to magistrates. Here were tried in 1660, after the Restoration, the surviving judges of Charles I.; and Milton's *Eikonoklastes* and *Defensio Prima* were in the same year burned at the Old Bailey by the common hangman. The patriot Lord William Russell was tried here in 1683, Jack Sheppard in 1724, Jonathan Wild in 1725, the poet Savage in 1727, Dr Dodd in 1777, Bellingham, the assassin of the statesman Perceval, in 1812, the Cato Street conspirators in 1820. The Old Bailey dinners given by the sheriffs to the judges were long famous. However else varied, they always included beefsteaks and marrow puddings, and were served twice a day. The Old Bailey adjoins Newgate (q.v.) Prison, between Holborn Viaduct and Ludgate Hill. Prisoners awaiting trial at this court are transferred to Newgate for the sake of convenience whilst the sessions here are sitting.

Old Believers. See RASKOLNIK.

Oldbury, a busy manufacturing town of Worcestershire, 5½ miles WNW. of Birmingham, stands in the midst of a rich mineral district, and has iron and steel works, besides factories for railway plant, edge-tools, chemicals, &c. Pop. (1851) 11,741; (1881) 18,841; (1891) 20,348. See J. Nichols' *History of Manceter Parish* (1791).

Oldcastle, SIR JOHN, once popularly known as the 'good Lord Cobham,' whose claim to distinction is that he was the first author and the first martyr among the English nobility, was born in the reign of Edward III.; the exact year is not known. He acquired the title of Lord Cobham by marriage with the heiress of the line, and signalised himself by the ardour of his attachment to the doctrines of Wyclif. At that time there was a party among the English nobles and gentry sincerely, even strongly, desirous of ecclesiastical reform, whose leader was 'old John of Gaunt—time-honoured Lancaster.' Oldcastle was active in the same cause, and took part in the presentation of a remonstrance to the English Commons on the subject of the corruptions of the church. At his own expense he got Wyclif's works transcribed, and widely disseminated among the people, and paid a large body of preachers to propagate the views of the Reformer throughout the country. In 1411, during the reign of Henry IV., he commanded an English army in France, and forced the Duke of Orleans to raise the siege of Paris; but in 1413, just after the accession of Henry V., he was examined by Archbishop Arundel, and condemned as a heretic. He escaped from the Tower into Wales, but after four years' hiding was captured. He was brought to London, and—being reckoned a traitor as well as a heretic—was hung up in chains alive upon a gallows, and, fire being put

under him, was burned to death, December 1417. Oldcastle wrote *Twelve Conclusions addressed to the Parliament of England*, several monkish rhymes against 'fleshye liveris' among the clergy, religious discourses, &c. Halliwell-Phillips first proved in 1841 that Shakespeare's Sir John Falstaff was originally Sir John Oldcastle—a view endorsed in Gairdner and Spedding's *Studies* (1881).

Old Catholics (Ger. *Altkatholiken*) is the title assumed by a number of Catholics who at Munich protested against the new dogma of the personal infallibility of the pope in all *ex cathedra* deliverances, proclaimed by the Vatican Council in 1870. It now applies to a communion or church in Germany and Switzerland, which has grown to be considerable in numbers and influence. The Munich protest by forty-four professors, Dr Döllinger and Professor Friedrich at their head, was directed against the binding authority of the Vatican Council and the validity of its decrees. To the Munich protest a number of Catholic professors at Bonn, Breslau, Freiburg, and Giessen declared their adhesion. The leaders of the movement met at the end of August at Nuremberg and drew up a declaration. The German bishops, though they had given warning of the dangerous consequences of the proclamation of the new dogma, submitted to the decision of the Vatican Council, and, in a pastoral letter of the 10th September 1870, called upon all members of the faculty of Catholic theology to signify their allegiance. Against the refractory (numerous professors and one priest) they proceeded by suspending them from their functions, and then by excommunication. The Prussian and Bavarian governments, however, took their respective subjects, the objects of those measures, under their protection.

At first the mass of the priests and laity showed very little sympathy with the movement, only two country congregations declaring their dissent from the decree of the Vatican Council. Pamphlets and appeals issued by the heads of the party elicited but little response. Local committees in furtherance of the cause were, however, formed in towns of Bavaria and the Rhine country. At a general Old Catholic Congress, held in 1871 at Munich, it was resolved to draw the bonds of union close with the church of Utrecht, the Jansenists (q.v.) of the Netherlands, which, under its archbishop and two bishops, offered to the Old Catholics the possibility of priestly consecration and confirmation. The congress, while carefully eschewing any decided breach with traditional dogma, and professing the desire simply to maintain the church as it stood before the 18th July 1870, propounded the far-reaching principle that the decisions of an ecumenical council, to be valid, must be in agreement with the existing faith of the Catholic people and with theological science. The hope was also expressed of a reunion with the Greek Oriental Church and a gradual understanding with the Protestants. Old Catholic congregations began to be formed in different towns of Bavaria and the Rhine country. In 1872 the Old Catholic priests in the German empire numbered about thirty. The Archbishop of Utrecht in July made a tour in Germany, holding religious service in Protestant churches and confirming the children of Old Catholics. At a second congress at Cologne, 1872, Professor Friedrich declared that the Old Catholic movement was now directed not merely against papal infallibility, but 'against the whole papal system, a system of errors during a thousand years, which had only reached its climax in the doctrine of infallibility.' Döllinger, the leader of the movement which led to the formation of the new

communion, at first disapproved of the establishment of a new sect, but ultimately approved of the action of his friends. Yet till his death he never formally joined the community.

At Cologne in 1873 Professor Reinkens of Breslau was elected bishop of the Old Catholics in the ancient fashion, by 'clergy and people'—by all the Old Catholic priests and by representatives of the Old Catholic congregations. He was consecrated at Rotterdam by the bishop of Deventer, and formally acknowledged by the governments of Prussia, Baden, and Hesse. The Bavarian government declined to forbid Bishop Reinkens holding confirmations in their kingdom. The third congress at Constance in 1873 was taken up with 'synodal and communal regulations,' and with projects towards union with other Christian confessions. There were numerous guests present, Anglican, Russian, and German Protestant clergy. On the basis of the decrees of this congress the first Old Catholic Synod was held at Bonn in 1874, being composed of thirty priests and fifty-nine laymen. They laid down principles for reforms in general, abolished auricular confession and compulsory fasting, and appointed two commissions to draw up a new ritual in the vulgar tongue, and to frame a Catechism and a Bible History. A formula of agreement drawn up at another conference of 1875 failed to command the assent of Easterns or Anglicans. The third and fifth congresses (those of 1876 and 1878) permitted priests to marry, and yet fulfil all ministerial functions, in spite of Jansenist protests.

After 1875 the numbers of the Old Catholics rather declined. In 1883 there were in the German empire 34,800 Old Catholics, of whom 16,300 were in the Prussian dominions, and about fifty priests. In Switzerland Old Catholicism early took root, the government having from the first protected the priests excommunicated by the bishop of Basel; at Bern in 1874 a special Old Catholic theological faculty was established, and a bishop, Dr Eduard Herzog, was consecrated by Bishop Reinkens in 1876. There are Old Catholic congregations in Austria, but the communion is not growing anywhere. In France a somewhat similar movement was advocated by Père Hyacinthe (q.v.).

See DÖLLINGER; Miss Scarth's *Story of the Old Catholic and Kindred Movements* (1883); an article in the *Church Quarterly*, vol. xix. (1884-85); 'Döllinger and the Papacy,' in the *Quarterly* (1891); *Janus* (Eng. trans. 1869); and German works on Old Catholicism by Forster (1879), Bühler (1880), Beysschlag (1882), and Reinkens (1882).

Oldenbarneveltdt. See BARNEVELDT.

Oldenburg, a grand-duchy of northern Germany, consisting of three distinct and widely separated territories—viz. Oldenburg Proper, the principality of Lübeck, and the principality of Birkenfeld. Total area, 2508 sq. m. (less than Devonshire); pop. (1885) 341,525. Oldenburg Proper, which comprises 3/4ths of this area, is bounded by the German Ocean and Hanover. The principal rivers are the Weser, the Jahde, and the Haase, Vehne, and other tributaries of the Ems. The country is flat, belonging to the great sandy plain of northern Germany, and consists for the most part of moors, heaths, marsh or fens, and sandy tracts. The occupations are mainly agricultural, with some iron-working, fisheries, and shipping; there is also a little wool-spinning and linen-weaving. The principality of Lübeck, consisting of the secularised territories of the former bishopric of the same name, does not contain the city (north of which it lies), and is surrounded by the duchy of Holstein. Its area is about 200 sq. m. The principality of Birkenfeld (q.v.) lies among the Hundarick Mountains, in the very south of Rhenish

350

Prussia, by which it is surrounded; its area is 192 square miles.

Oldenburg is a constitutional ducal monarchy. The constitution, which is based upon that of 1849, revised in 1852, is common to the three provinces, which are represented in one joint chamber. Each principality has, however, its special provincial council. The grand-duke has a civil list of £12,570, besides private revenues.

Oldenburg became an independent state in 1180. The family that then established its power has continued to rule to the present day, giving, moreover, new dynasties to the kingdom of Denmark, the empire of Russia, and the kingdom of Sweden. On the death, in 1667, of Count Anthony Gunther, the wisest and best of the Oldenburg rulers, his dominions fell to the Danish reigning family, and continued for a century to be ruled by viceroys nominated by the kings of Denmark. This union was, however, severed in 1773, when by a family compact Christian VII. made over his Oldenburg territories to the Grand-duke Paul of Russia, who represented the Holstein-Gottorp branch of the family. Paul having given up Oldenburg to his cousin, Frederick-Augustus, of the younger line of the House of Oldenburg, the emperor raised the united Oldenburg territories to the rank of a duchy. For a time the duchy was a member of Napoleon's Rhenish Confederation. The Lübeck territories were added in 1803; Birkenfeld at the Congress of Vienna, when Oldenburg became a grand-duchy. The grand-duchy concluded in 1866 a treaty with Prussia, by which the grand-duke renounced his claims to the Holstein succession. See SLESWICK-HOLSTEIN.

The capital, OLDENBURG, is pleasantly situated on the banks of the Hunte, 30 miles WNW. of Bremen by rail. It is the focus of the literary, scientific, and commercial activity of the duchy, and has a public library of 100,000 volumes, a picture-gallery, museum, &c. The grand-ducal palace is worthy of note for its fine gardens, its valuable pictures and other art collections, and its library. The principal church, St Lambert's (1270), contains the burying-vaults of the reigning family. Oldenburg is the seat of an active river-trade, and is noted for its great cattle and horse fairs. Pop. (1875) 15,701; (1890) 21,646. See *Runde's Oldenburgische Chronik* (3d ed. 1863).

Oldenburg, HENRY, a native of Bremen, born in 1626, was consul for his native city in London during the period of the Long Parliament and the protectorship of Cromwell. Besides being tutor to Lord Henry O'Brien and Lord William Cavendish, he was elected one of the very first members of the Royal Society, and, as assistant-secretary, edited its *Transactions* from 1664 to 1677, maintaining an extensive correspondence with Spinoza, Leibnitz, Bayle, and many other learned men of the age. Milton also knew him, and addressed him in the *Epistolæ Familiares*. Oldenburg died at Charlton, near Greenwich, in August 1678.

Oldham, a parliamentary, municipal, and county borough of Lancashire, on the Medlock, 7 miles NE. of Manchester, 5 SSE. of Rochdale, and 38 ENE. of Liverpool. It has grown since 1760 from a small village, such growth being due to its proximity to the Lancashire coalfields and to the marvellous extension of its cotton manufactures. It has nearly 300 mills, with more than 12 million spindles, which consume one-fifth of the total imports of cotton from abroad; and the other manufactures include fustians, velvets, silks, hats (once a leading industry), cords, &c., besides huge weaving-machine works, one employing 7000 hands. The town-hall (1841) is a good Grecian edifice, enlarged in 1879 at a cost of £29,000; and there

are the lyceum (1854-80), a school of science and art (1865), public baths (1854), an infirmary (1870-77), and the Alexandra Park of 72 acres (1865). Oldham received its charter of incorporation in 1849. It was enfranchised by the Reform Bill of 1832, and returns two members, the parliamentary borough (which extends into Ashton-under-Lyne parish) covering 19½ sq. m., the municipal only 7½. Pop. of the former (1881) 152,513; of the latter (1801) 12,024; (1841) 42,595; (1881) 111,343; (1890) 146,716.

Oldhamia, a genus of fossils of unknown affinities met with in the Cambrian system. Oldhamia assumes various forms, sometimes consisting of short radiating branches or umbels, which spring at regular intervals from a central thread-like axis; at other times the branches radiate in all directions from a central point. Some paleontologists have supposed the fossil to be a Sertularian zoophyte; others have referred it to the polyzoa; while yet others think it may be a seaweed. Possibly it is not a fossil at all, but merely an inorganic structure.

Oldhaven Beds. See EOCENE SYSTEM.

Oldmixon, JOHN (1673-1742), author of dull histories of England, Scotland, Ireland, and America, and of works on logic and rhetoric, is known chiefly as one of the heroes of Pope's *Dunciad*.

Old Mortality. See PATERSON (ROBERT).

Old Point Comfort, a village and watering-place of Virginia, at the mouth of James River, on Hampton Roads, is the site of Fortress Monroe.

Old Red Sandstone and Devonian System, the name given to certain series of strata that are intermediate in age between the Silurian and Carboniferous systems. These, known respectively as 'Old Red Sandstone' and 'Devonian,' are nowhere seen together, but the one is believed to be the equivalent of the other.

Old Red Sandstone.—This series, which underlies the Carboniferous system, was so called to distinguish it from another set of red sandstones which rests upon the Carboniferous strata, and was formerly known as the *New Red Sandstone* (see PERMIAN, and TRIASSIC). In the British Islands the Old Red Sandstone is confined to Scotland, Wales, and Ireland. In Scotland it comprises two groups of strata, the upper resting unconformably on the lower. The *lower group* attains a great thickness (20,000 feet as a maximum), and consists of coarse red, gray, brown, and purplish and sometimes yellowish sandstones, gray flagstones, clays, and shales, coarse conglomerates, and local beds of limestone and cornstone. Associated with these strata are interbedded lavas (porphyrites, diabase, &c.) and tuffs, which in some regions (Sidlaws, Ochils, Pentlands, Cheviots, Ayrshire, &c.) reach several thousand feet in thickness. The fossils of the Lower Old Red Sandstone consist chiefly of fishes and crustaceans and badly-preserved plants, which are mostly lycopodiaceous. In Lanarkshire a thin bed of shale in the group has yielded a few Upper Silurian fossils. The *upper group* comprises red sandstones, clays, conglomerates, and breccias, the sandstones in some areas being gray, yellow, or white. Few fossils occur, and these are chiefly the remains of ganoid fishes. In Arran the group contains a limestone which has yielded marine Carboniferous fossils. In some places this group passes upwards conformably into the lower member of the Carboniferous system.

In Wales the Old Red Sandstone appears to graduate downwards into the Upper Silurian, and to be likewise conformable with the overlying Carboniferous strata. In Ireland, as in Scotland,

there appears to be an unconformity between the upper and lower groups of the series, the former passing conformably upwards into the Carboniferous, and the latter ('Glengarriff Grits') graduating downwards into the Upper Silurian.

In Scotland the Old Red Sandstone strata are developed chiefly in the Lowlands, but here and there they rise to considerable elevations. They flank the Palæozoic strata of the southern uplands and the Highlands, and are probably more or less continuous underneath the overlying Carboniferous strata throughout the whole breadth of central Scotland. Other wide areas occur in the lower basin of the Tweed, along the borders of the Moray Firth, in Caithness, Orkney Islands, &c. In Wales the Old Red Sandstone is well developed in the region watered by the Usk and the Wye. In Ireland it is met with chiefly in the west and south-west.

Devonian.—In Devon and Cornwall we meet with a very different series of strata occupying the same stratigraphical position as the Old Red Sandstone. The Devonian strata pass up conformably into the Carboniferous system, but the base of the series is not seen, so that the relation of the strata to the Silurian is not known. The English Devonian probably does not exceed 10,000 or 12,000 feet in thickness. It consists of three groups (Lower, Middle, and Upper), the rocks being principally gray and brown slates, brown, yellow, red, and purple sandstones, grits, conglomerates, calcareous slates, and limestones. The calcareous members of the series are generally well charged with fossils of marine types, and are developed chiefly in the middle group.

Devonian rocks occupy wide areas at the surface on the Continent. They appear in the north of France, and extend from the Boulonnais eastwards through Belgium to Westphalia. In northern Russia they extend over more than 7000 miles, and crop up along the flanks of the Urals. But the areas exposed to view probably bear but a small proportion to those which lie buried underneath later formations. In central Europe the strata have the general aspect of the English Devonian, and contain relics of the same marine fauna. In Russia the strata are remarkable for showing alternations of calcareous and arenaceous rocks—the former of which contain an assemblage of fossils of a Devonian facies, while the latter are charged with the remains of a fish fauna resembling that of the Scottish Old Red Sandstone. It may be noted that volcanic rocks are here and there associated with the Devonian strata of central Europe. In North America both types of strata appear; the arenaceous type occurring in Nova Scotia and New Brunswick, while the Devonian type is met with in the state of New York and the Appalachian region, and is largely developed in the Mississippi basin.

Life of the Period.—Fucoidal markings are not uncommon in the Devonian strata, but land-plants rarely occur. These latter, however, are met with now and again in the Old Red Sandstone, more especially in that of Nova Scotia and New Brunswick. The chief forms are tree-ferns and small herbaceous ferns, lycopods (lepidodendroids), great horsetails (Calamites), and sigillarioids. The vegetation would thus appear to have been for the most part flowerless. Here and there, however, remains of large conifers have been detected. Among the lower forms of life that swarmed in the seas of the period were rugose and tabulate corals. Of the former the most characteristic were Cyathophyllum, Cystiphyllum, Calceola, &c., while the honeycomb corals (Favosites) are the most common of the tabulate forms. Echinoderms abounded, especially crinoids (Cupressocrinus, Cyathocrinus) and pentrem-

ites. Trilobites, which formed so marked a feature in the life of the Silurian seas, were now reduced in number and variety—among the more notable forms being Phacops, Homalonotus, and Bronteus. Some of the eurypterids (most of which are small) attained a large size, one of these (Pterygotus) being 5 or 6 feet long. They occur chiefly in the Old Red Sandstone. From the same strata in North America have come the remains of insects—neuropteroid and orthopteroid wings of ancestral forms of May-fly, &c. Myriopods have also been recognised. Brachiopods are among the most common Devonian fossils; indeed this group appears to have reached its maximum development in the seas of that period. Very characteristic forms are Uncites, Stringocephalus, and Rensseleria. Lamellibranchs were well represented, some of the notable genera being Pterinea, Megalodon, Cucullæa, Avicula, &c. The marine gasteropods call for no particular mention, for they belong chiefly to types which had come down from earlier Palæozoic times. One may note, however, that the earliest pulmonates (Snails, &c.) come from the Old Red Sandstone. The straight Orthoceras and other old genera of cephalopods continued to flourish, but coiled forms (Clymenia, Goniatites) began to predominate in Devonian times. From the Old Red Sandstone chiefly come the remains of numerous ganoid fishes—a group feebly represented in existing waters. Among these are the placogonoids Cephalaspis, Pteraspis, Pterichthys, and Coccosteus, and the lepidogonoids Osteolepis, Diplopterus, Holoptychius, Acanthodes, &c. The largest placogonoid was the Dinichthys of North America—the armoured head of which was 3 feet in length. According to Dr Newberry, this fish was probably not less than 15 feet long, ‘encased in armour, and provided with formidable jaws, which would have severed the body of a man as easily as he bites off a radish.’ Other forms (such as Dipterus, and possibly Phaneropleuron) appear to have relations with the modern mud-fish (Ceratodus) of Australia.

It is obvious that in the Old Red Sandstone and Devonian we have two distinct types of sedimentation; the two series must have accumulated under different physical conditions. The Devonian strata are unquestionably of marine origin, while the Old Red Sandstone beds are believed to have been deposited in large lakes or inland seas. Hence we meet with the latter in a few more or less isolated basins, while the former extends over enormous regions. From the geographical distribution of the marine Devonian in Europe we gather that during the period in question the sea covered the south of England and the north-east of France, whence it extended eastwards, occupying the major portion of central Europe, and sweeping north-east through Russia, and how much farther we cannot tell. North of that sea stretched a wide land surface, in the hollows of which lay great lakes and inland seas, which seem now and again to have communicated with the ocean. It was in these broad sheets of water that the Old Red Sandstone strata were accumulated. Several of these old lakes in Scotland were traversed by lines of volcanoes, the relics of which are seen in many of the hill-ranges of the central and southern regions of that country. Volcanic action also at the same time manifested itself in some parts of Germany, but on a smaller scale apparently than in the Scottish area. The land, as we have seen, was clothed for the most part with a monotonous flowerless vegetation, but large pines grew on the higher and drier uplands, whence they were occasionally carried down by rivers to the lakes and seas. Very little is known of the terrestrial animal life of the period; most of the fossils met with in the lacustrine sediments of the period

consisting of the remarkable ganoids and eurypterids already referred to. These (the fishes especially) appear to have abounded in the lakes, whence, however, they now and again descended by the rivers to the sea. The general facies and the geographical distribution of the life of the Devonian and Old Red Sandstone are suggestive of genial climatic conditions. Some geologists, however, have thought that the coarse breccias and conglomerates which occur in the Old Red Sandstone may be indicative of somewhat cold conditions; for these masses have often quite the aspect of morainic accumulations. It is possible, therefore, either that local glaciers may have existed in certain regions, or that the temperature may have been lowered for some time over wider areas. However that may be, the presence of the Devonian fauna in the Arctic regions seems to show that the temperature of the ocean must have been more equable in Devonian times than it is now.

Old Style. See CALENDAR.

Oldys, WILLIAM, an industrious bibliographer, was a natural son of Dr Oldys, Chancellor of Lincoln, and was born in 1696. The most of his life was spent as a bookseller's hack. He drank hard, and soon squandered the property left by his father, and when the dissolute old bookworm died (April 15, 1761) he left hardly enough to decently bury him. For about ten years Oldys acted as librarian to the Earl of Oxford, whose valuable collection of books and MSS. he arranged and catalogued, and by the Duke of Norfolk he was appointed Norroy King-of-arms. His chief works are *The British Librarian* (1737, anonymously); a *Life of Sir Walter Raleigh*, prefixed to Raleigh's *History of the World* (1738); *The Harleian Miscellany* (8 vols. 1753), besides many miscellaneous literary and bibliographical articles.

Oleaceæ, a natural order of exogenous plants, consisting of trees and shrubs, with opposite leaves, and flowers in racemes or panicles. Nearly 150 species are known, mostly natives of temperate countries. Among them are the olive, lilac, privet, Phillyrea, fringe tree, &c. Between some of these there is a great dissimilarity, so that this order is apt to be regarded as a very heterogeneous group; but the real affinity of the species composing it is manifested by the fact that even those which seem most unlike can be grafted one upon another, as the lilac on the olive. Bitter, astringent, and tonic properties are prevalent in this order.

Oleander (*Nerium*), a genus of plants of the natural order Apocynaceæ. The species are evergreen shrubs with leathery leaves, which are opposite or in threes; the flowers in false umbels, terminal or axillary. The Common Oleander (*N. oleander*), a native of the south of Europe, the north of Africa, and many of the warmer temperate parts of Asia, is frequently planted in temperate countries as an ornamental shrub, and is not uncommon in Britain as a window-plant. It has beautiful red, or sometimes white flowers. The English call it Rose Bay, and the French Rose Laurel (*Laurier Rose*). It attains a height of eight or ten feet. Its flowers give a splendid appearance to many ruins in the south of Italy. It delights in moist situations, and is often found near streams. All parts of it contain a bitter and narcotic-acrid juice, poisonous to men and cattle, which flows out as a white milk when young twigs are broken off. Cases of poisoning have occurred by children eating its flowers, and even by the use of the wood for spits or skewers in roasting meat. Its exhalations are injurious to those who remain long under their influence, particularly to those who sleep under it. A decoction of the leaves or bark is much used in

the south of France as a wash to cure cutaneous maladies. *N. odoratum*, an Indian species, has larger flowers, which are very fragrant. *N. piscidium* (or *Eschaltum piscidium*), a perennial

Common Oleander (*Nerium oleander*).

climber, a native of the Khasia Hills, has a very fibrous bark, the fibre of which is used in India as hemp. The steeping of the stems in ponds kills fish.

Oleaster. See **ELÆAGNUS**.

Ole Bull. See **BULL**.

Olefiant Gas, or **ETHYLENE**, C_2H_4 , is the most abundant illuminating constituent in coal-gas. It may be obtained by the destructive distillation of coal, but more readily by the action of sulphuric acid on alcohol. It is a colourless gas with a faint odour, but little soluble in water or alcohol. It may be liquefied by cold and pressure. With air it forms a powerfully explosive mixture, which, on being burned, yields water and carbonic acid gas. When mixed with an equal volume of chlorine, and kept cool and in the dark, the two gases unite, with the production of drops of an oily liquid called Dutch Liquid (q.v.).

Olefines. See **HYDROCARBONS**.

Oleic Acid is one of the acids present in olive, almond, and other oils, in which it is united to glycerine. At temperatures above 57° (14° C.) it exists as a colourless limpid fluid, of an oily consistence, devoid of smell and taste, and (if it has not been exposed to air) exerting no action on vegetable colours. At 40° (4.4° C.) it solidifies into a firm, white, crystalline mass, and in this state it undergoes no change in the air; but when fluid it readily absorbs oxygen, becomes yellow and rancid, and exhibits a strong acid reaction with litmus paper. It is very difficult to obtain the acid in a state of purity, in consequence of the readiness with which it oxidises. It is obtained in a crude form, as a secondary product, in the manufacture of stearin candles; but when the pure acid is required a lengthy process, starting with almond oil, must be adopted. Oleic acid forms normal (or neutral) and acid salts; but the first compounds of this class that require notice are the normal salts of the alkalies. These are all soluble, and by the evaporation of their aqueous solution form *soaps*. Oleate of potash forms a soft soap, which is the chief ingredient in Naples soap; while oleate of soda is a hard soap, which enters largely into the composition of Marseilles soap. Of recent years a large number of oleates have come into use in

medicine, which depend for their activity on the remarkable ease with which they are absorbed by the skin. Such are the oleates of zinc, mercury, lead, tin, morphia, &c., which, in this form, produce more rapid results than when applied as ointments.

Olein is a compound of oleic acid with glycerine, and constitutes the bulk of olive-oil. Along with it are associated stearin and palmitin, similar compounds of stearic and palmitic acids with glycerine.

Olenus, a genus of Cambrian trilobites highly characteristic of the upper members of the system.

Oleograph. This is a name given to an ordinary chromo-lithograph which has been 'roughed' after printing, mounted on canvas, and varnished so as to imitate an oil-painting. See **LITHOGRAPHY**.

Oleomargarine. See **BUTTER**.

Oleometer, or **ELAYOMETER**, an areometer or balance for ascertaining the densities of fixed oils. It consists of a very delicate thermometer-tube, the bulb being large in proportion to the stem, so weighted and graduated as to adapt it to the densities of the leading fixed oils. On the scale is marked the principal oils of commerce, with their specific gravity opposite. The standard temperature of the oleometer is 59° F. Those in general use are Gobby's and Lefebvre's oleometers, Fisher's oil-balance, and Brix's areometer for lighter liquids.

Oléron (anc. *Uliarus*), an island lying 2 to 10 miles off the west coast of France, and forming part of the department of Charente-Inférieure. It is 19 miles long by about 5 broad, and is unusually fertile. Pop. 17,720, mostly Protestants. On Oléron are the port of Le Château, and the small towns of St Pierre d'Oléron and St Georges d'Oléron.

The Laws or Judgments of Oléron were a code of maritime law compiled at the instance of Eleanor of Guienne before she married Henry II. of England, modelled on the *Book of the Consulate of the Sea* (a maritime code regulating commerce in the Levant), but drawn from the decisions of the maritime court of Oléron, in the duchy of Guienne. It was intended for the use of mariners in the Atlantic waters, was introduced into England in the end of the 12th century and into Flanders in the 13th. The usages and decisions upon which it was based were those observed in the wine and oil trade between Guienne and the ports of England, Normandy, and Flanders. An English translation was published as *Rutter of the Sea*, by T. Petyt in 1536. See **INTERNATIONAL LAW**.

Olga, ST, a saint of the Russian Church, wife of the Scandinavian (Varangian) Duke Igor of Kieff, who, after her husband's death (946), governed during the minority of her son, till 955. Thereafter she repaired to Constantinople, and was baptised, assuming the name of Helena. Returning to Russia, she laboured with much zeal for the propagation of her new creed. After her death (968) she was canonised, and is now held in high veneration in the Russian Church. Her festival is held on July 21.

Olibanum, a gum-resin which flows from incisions in several species of *Boswellia*, growing on bare limestone rocks in the mountains of Somali Land and the south of Arabia. These trees send their roots to a great depth into the crevices of the rock (see **BOSWELLIA**); and an exhaustive memoir on this gum-resin by Sir George Birdwood, published in the *Linnean Transactions*, xxvii. p. 111). Olibanum is the *Lebanah* of the Hebrews, *Libanos* or *Libanotos* of the Greeks, *Thus* of the Romans, of all which terms the ordinary English translation is Frankincense (q.v.). It

occurs in commerce in semi-transparent yellowish tears and masses; has a bitter nauseous taste; is hard, brittle, and capable of being pulverised; and diffuses a strong aromatic odour when burned. It was formerly used in medicine, chiefly to restrain excessive mucous discharges; but its use for such purposes is now rare. It sometimes enters as an ingredient into stimulating plasters. It is chiefly employed for fumigation, and is used as incense in Roman Catholic churches and Indian temples. Its odour is obnoxious to mosquitoes and other insects. The inner layers of the bast of *B. frereana* are transparent, resembling oiled paper, and are used by the natives for writing on. Aden is the great port where it is chiefly received. The imports there in 1888 were 16,248 cwt. of ordinary olibanum and 3600 cwt. of that termed Mayeti, the name of the port from which it is received in Somali Land. This is the produce of *B. frereana*, and much resembles Tacamahac. The exports of olibanum from Aden in 1888 were 23,000 cwt. In India, where it is much used, the imports increase year by year, and reached 26,680 cwt. in 1888. Some is sent to China, and about 17,000 cwt. comes to England, valued at about £41,000.

Olifant River, a forked stream of Cape Colony, rises in the mountains north-east of Cape-town, and, after a north-westerly course of 150 miles, enters the Atlantic. Area of drainage basin, 13,000 sq. m.—Another stream bearing the same name rises in the Transvaal, and goes east to join the Limpopo.

Oligarchy (*oligos*, 'few,' and *archo*, 'I govern'), a term applied by Greek political writers to that perversion of an aristocracy in which the efforts of the dominant and ruling party are chiefly devoted to their own aggrandisement and the extension of their power and privileges. Thus it bears the same relation to aristocracy that despotism does to monarchy and ochlocracy to democracy.

Oligocene System. The British strata belonging to this system occur only in Hampshire, the Isle of Wight, and Devonshire. The series is as follows:

4. **HEMPSTEAD BEDS:** fresh-water marls and clays overlaid by marine septarian clays. About 200 feet.
3. **BEMBRIDGE BEDS:** marls and limestone; fresh-water below, estuarine above. About 110 feet.
2. **OSBORNE BEDS:** fresh-water clays, marls, sands, and limestone. About 100 feet.
1. **HEADON BEDS:** variable series of clays, marls, sands, and limestones. The lower division is of fresh- and brackish-water origin; the middle partly marine, partly fresh-water; the upper fresh-water. About 160 feet.

Usually included as Oligocene are the lacustrine beds of Bovey Tracey in Devonshire, consisting of sands and clays with lignites. Between the basalt-beds that compose the denuded plateaus of Antrim and the Inner Hebrides (Mull, &c.) occur thin layers of clay and lignite—the so-called *leaf-beds*—which are probably of the same age.

Foreign Equivalents.—Oligocene strata, chiefly of fresh- and brackish-water origin, but containing intercalations of marine beds, overlie the Eocene of the Paris basin and that of Belgium. They likewise appear in Germany, where they form the oldest Tertiary deposits—no Eocene having yet been detected in that region. The German Oligocene is mainly of fresh-water origin in its lower and upper portions, while marine deposits predominate in the middle of the series. It is noted for its beds of lignite or brown coal. In Switzerland the Oligocene attains a thickness of several thousand feet, chiefly conglomerates and sandstones, known as *Molasse*, and mostly of fresh-water origin; the basal portions, however, are marine and brackish-water. Other areas of fresh-water Oligocene more or less notable are met with in Alsace, Breisgau,

and Würtemberg. In Auvergne, central France, lacustrine deposits of the same age are well developed, and, like most of the Oligocene strata, have yielded great numbers of organic remains.

Life of the Period.—The flora of Oligocene times was abundant and varied. Palm-trees (*Sabal*, *Flabellaria*), both large and small, seem to have grown over all Europe. Amongst conifers were various American types (*Libocedrus*, *Chamaecyparis*, *Sequoia*, *Taxodium*) and other forms, such as *Glyptostrobus*, like *G. heterophyllus* of Japan and China, *Widdingtonia*, a genus now found only in South Africa and Madagascar. There were also proteaceous plants (*Dryandra*) of Australian affinities, and species of custard-apple, gum-tree, spindle-tree, maple, acacia, mimosa, lotus, aralia, camphor-tree, cinnamon-tree, evergreen oak, laurel, &c., besides such familiar forms as birch, hornbeam, elder, elm, poplar, walnut, &c. Evergreens were the prevalent forms. The invertebrate fauna needs but little notice. Amongst notable molluscs were volutes, cowries, olives, cones, spindle-shells, &c. *Cerithium* was particularly plentiful in the estuaries of the period; while lamellibranchs were well represented by modern types of marine and fresh-water habitats. Amongst the birds common in Europe were paroquets, trogons, marabouts, cranes, flamingoes, ibises, pelicans, eagles, secretary-birds, sand-grouse, &c. At the beginning of the period many mammals of extinct types lived in Europe, such as *Palaotherium* and *Anchitherium*, survivals from the Eocene; certain transitional forms of ungulates, such as *Cainotherium* (a small animal somewhat resembling the living chevrotains in outward appearance), *Xiphodon* (a slenderly built deer-like animal), and *Anoplotherium* (a long-tailed animal about the size of an ass, with two toes on each foot); various tapirid animals, small rhinoceroses, *Hyaenodon* (a carnivore), also forms of squirrel, civet, martin, mole, musk-rat, &c.

Physical Conditions.—During Oligocene times a wide land surface appears to have extended over all the British area. In the region lying between what is now Antrim and the west coast of Scotland great fissure-eruptions took place, and sheet after sheet of basalt was poured out, so as eventually to form broad plateaus that extended northwards beyond Skye. In the intervals between successive eruptions these plateaus became clothed with vegetation, the debris of which has been here and there preserved in the deposits of shallow lakes that dotted the surface of the volcanic country. It is probable that at this time there was land-connection between Europe and North America by way of the Faroe Islands and Iceland, in both of which tracts similar basaltic plateaus occur, containing intercalated layers of lignite, &c. like those of Antrim and the Western Islands of Scotland. The Oligocene strata of the south of England and the Franco-Belgian area are evidence that the sea or estuarine waters which occupied that region in Eocene times (see EOCENE SYSTEM) were gradually silted up. In Germany there existed great fresh-water lakes, fringed by wide marsh-lands and by dense forests of a subtropical character. As the lakes became partially silted or dried up vegetation encroached upon their deserted beds, only to be buried under fresh accumulations of sand and mud when the water had again risen. That these lakes were now and again in direct communication with the sea is shown by the occurrence of thick layers of marine origin intercalated amongst the fresh-water beds. For some time, indeed, the lacustrine areas were entirely usurped by the sea, which may have entered them from submerged regions in the east of Europe. In Switzerland, in like manner, we have evidence of changing conditions. At first the sea covered a considerable

portion of the country, but eventually it disappeared, and its place was taken by a series of brackish-water lagoons and fresh-water lakes. The deposits accumulated in those lakes now form considerable mountains at the base of the Alps (Rigi, Rossberg). In central France, as in Germany, lacustrine conditions were characteristic of the period, one or more great lakes having occupied a considerable area in Auvergne. In southern Europe the Mediterranean had withdrawn from wide regions which were deeply submerged by it in Eocene times, but it still covered a more extensive area than at present. The climate of the Oligocene period was uniformly genial, but hardly so tropical as that of the preceding period. See EOCENE SYSTEM.

Oligoclase. See FELSPAR.

Olinda, a city of Brazil, 4 miles NE. of Pernambuco. Pop. 7000.

Oliphant, LAURENCE, traveller, novelist, and mystic, was born in 1829, son of Sir Anthony Oliphant, Chief-justice of Ceylon. In early youth he travelled with Jung Bahadur to Nepal, and after his return was admitted a member of the Scottish bar, and later of the English bar at Lincoln's Inn. His first work, *A Journey to Khatmandu* (1852), was followed by *The Russian Shores of the Black Sea* (1853), the fruit of his travels in Russia in 1852. He next became private secretary to the Earl of Elgin, Governor-general of Canada, whom later he accompanied on his special embassy to China, thus finding material for his books *Minnesota and the Far West* (1855) and *A Narrative of the Earl of Elgin's Mission to China and Japan in 1857-59* (1860). In 1861, while acting as Chargé d'Affaires in Japan, he was severely wounded by assassins, and consequently resigned his post. From 1865 to 1868 he sat in parliament for the Stirling burghs. Having become profoundly influenced by certain peculiar religious opinions, he renounced London society, joined for a time the community of T. L. Harris (q.v.) in the United States, and finally settled at Haifa (q.v.) in Palestine. He died at Twickenham, 23d December 1888. The religious opinions of his later years he gave to the world in *Sympneumata* (1886) and *Scientific Religion* (1888), as well as in his novel *Masollam* (1886), while they already formed the background of his earlier novel, *Altiora Peto* (1883). Oliphant, when he subjected his intellect to occultism, brought a bright career to an abrupt conclusion, and flung away a rare literary endowment. His *Piccadilly* (1870) was a book of altogether exceptional promise, bright with wit, delicate irony, and, above all, individuality; but its promise was never fulfilled.

Other books of Oliphant's were *The Transcaucasian Campaign under Omar Pasha* (1856); *Patriots and Filibusters* (1860); *The Land of Gilead* (1881); *Traits and Travesties, Social and Political* (1882); *The Land of Khemi* (1882); *Haifa* (1887); and *Episodes in a Life of Adventure* (1887). See his *Life* by Mrs Oliphant.

Oliphant, MRS MARGARET (née WILSON), one of the most distinguished of modern female novelists, was born in 1828 at Wallyford, near Musselburgh, Midlothian. In 1849 she published her first work, *Passages in the Life of Mrs Margaret Maitland*, which instantly won attention and approval. Its most distinctive charm is the tender humour and insight which regulate its exquisite delineation of Scottish life and character at once in their higher and lower levels. This work was followed by *Caleb Field* (1850), *Merkland* (1850), *Adam Graeme* (1852), *Harry Muir* (1853), *Magdalen Hepburn* (1854), *Lilliesleaf* (1855), and *Katie Stewart* (1852), *The Quiet Heart* (1854), *Zaidee* (1855), the last three of which origin-

ally appeared in succession in *Blackwood's Magazine*. Though these are of somewhat various merit, in all of them the peculiar talent of the writer is marked. They are rich in the minute detail which is dear to the womanly mind; have nice and subtle insights into character, a flavour of quiet humour, and frequent traits of delicacy and pathos in the treatment of the gentler emotions. It was, however, by the *Chronicles of Carlingford* (first published in *Blackwood's*, 1861-64) that her reputation as a novelist was first secured. In the first of them, *The Doctor's Family*, the character of little Netty, the heroine, vivifies the whole work, and may rank as an original creation. The next in the series, *Salem Chapel*, perhaps indicates a wider and more vigorous grasp than is to be found in any other work of the authoress. Certain of the unlovelier features of English dissent, as exhibited in a small provincial community, are here graphically sketched, and adapted with admirable skill to the purposes of fiction. After more than forty years of novel-writing Mrs Oliphant's powers show no decadence. She still possesses the old art of interesting her readers; there is still the same fidelity to truth in the minor details of her novels. Mrs Oliphant has been resident at Windsor for many years. A civil list pension of £100 was conferred upon her in 1868.

Her other works include *Agnes* (1865); *Madonna Mary* (1866); *The Minister's Wife* (1869); *John and Three Brothers* (1870); *Squire Arden* (1871); *Ombra* (1872); *A Rose in June* (1874); *Phabe Junior* (1876); *The Primrose Path* (1878); *Within the Precincts* (1879); *He that Will Not when He May* (1880); *In Trust* (1882); *The Ladies Lindores and It was a Lover and his Lass* (1883); *Hester, The Wizard's Son, and Sir Tom* (1884); *Madam and Two Stories of the Seen and Unseen* (1885); *House Divided against Itself* (1886); *A Country Gentleman and The Son of his Father* (1887); *The Second Son and Joyce* (1888); *Neighbours on the Green, Lady Car, and A Poor Gentleman* (1889); *The Duke's Daughter and Kirsteen* (1890). Her more important contributions to general literature have been *Life of Edward Irving* (1862); *Historical Sketches of the Reign of George II.* (1869); *St Francis of Assisi* (1871); *Memoir of the Comte de Montalembert* (1872); *The Makers of Florence* (1876); *Dress* (1878); *The Literary History of England, from 1790 to 1825* (1882); *A Little Pilgrim: in the Unseen* (1882); *The Makers of Venice* (1888); *Dante and Cervantes* in the series of 'Foreign Classics for English Readers,' for which she has also acted as editor; *Memoir of Principal Tulloch* (1888); *Royal Edinburgh* (1890); and *Life of Laurence Oliphant* (1891).

Olivarez, GASPARD DE GUZMAN, COUNT OF, Duke of San Lucar, the favourite of Philip IV. of Spain, was born on January 6, 1587, at Rome, where his father was ambassador. He belonged to a distinguished but impoverished family, received a learned education, and became the friend of Philip IV., his confidant in his amours, and afterwards his prime-minister, in which capacity he exercised almost unlimited power for twenty-two years. Olivarez showed ability for government; but his constant endeavour was to wring money from the country that he might carry on wars against Portugal, France, and the Netherlands. His attempts to rob the people of their time-honoured privileges provoked insurrections in Catalonia and Andalusia, and roused the Portuguese to shake off the Spanish yoke in 1640. But the continued ill-success of the arms of Spain at length thoroughly roused the nation, and the king was obliged to dismiss his favourite in 1643. He was ordered to retire to Toro (Zamora), and died there, 22d July 1645. See De la Rocca, *Histoire du Ministère du Comte-Duc d'Olivares* (1673).

Olive (*Olea*), a genus of trees and shrubs of the natural order Oleaceæ, having opposite, evergreen, leathery leaves, which are generally entire, smooth, and minutely scaly. The general character of the

genus is well illustrated by the accompanying cut. The species are widely distributed in the warmer temperate parts of the globe. The Common Olive (*O. Europæa*), a native of Syria and other Asiatic countries, is in its wild state a thorny shrub or small tree, but through cultivation becomes a tree of 20 to 30 feet high, destitute of spines. It attains a prodigious age; some plantations, as those at Terni, in Italy, are supposed to have existed from

Common Olive (*Olea Europæa*), Branch in Flower :
a, ripe fruit; b, section of same showing stone.
(Bentley and Trimen.)

the time of Pliny. Some trees in Turkey are credited with an age of 1200 years. There are two varieties of the common olive, one having narrow, willow-like leaves, gray green above and silvery below. In the other the leaves are similar in all respects, only much broader. The latter has also much the larger fruit of the two, but the oil it yields is rank and coarse to the palate, and is rarely used on the Continent out of Spain, in which country it is the variety chiefly cultivated. The narrow-leaved variety is preferred by the French and Italian olive-growers, the more bland and agreeable oil from which is better appreciated, especially by the British. Olive-oil may be said to form the cream and the butter of Spain and Italy, as it takes the place of those products of milk in the cookery and table uses of those countries. Being highly nutritious, it is also regarded as more wholesome than animal fats in warm climates. The finest quality of olive-oil is obtained from Leghorn. The oil is contained in the fleshy part of the fruit—not in the seed—from which it is extracted by pressure. The fruit when ripe is crushed to a paste. It is then put into woollen bags and subjected to pressure moderately. Thus is obtained in considerable quantity the finest quality of oil, which is named 'Virgin Oil.' The pulp is then moistened with water and again pressed, the result being an oil of inferior quality, yet quite fit for table purposes. A further residue of oil is extracted from the pulp after it has been steeped in water; but it is only fit for soap-making and other manufacturing purposes (see OILS, and COTTON-SEED OIL). Unripe olives are pickled both for consumption in the countries in which they are grown and for exportation to other countries. The best pickled olives come from Genoa and Marseilles to England, but quantities are also imported from Languedoc, Leghorn, and Naples. They are eaten abroad before meals as a whet to the appetite, and in England at dessert with wine to restore the palate and as a

digestive. Dried olives are also used for the same purposes, as well as pickled olives. The wood is much prized by cabinet-makers, being beautiful in colour and grain, and capable of taking a fine polish; that of the root is most in demand for the making of snuff-boxes and ornaments.

The olive has been cultivated in the East from the remotest times, is associated with much mythical lore, and has been regarded in all ages as the bounteous gift of heaven, as the emblem of peace and plenty, and the highest reward that could be given to the honourable and the brave. The area devoted to olive-culture in Italy is stated at about 2½ million acres, and the total production of olive-oil is some 90 million gallons. The olive is also largely cultivated in Turkey and the Levant, in Morocco and Tripoli, as well as Spain; and some attention is being paid to its culture in South Australia. It grows luxuriantly in Chili, whither it was brought by the Spaniards. Jesuit missionaries introduced it into Mexico in the 17th century, and into California, where it grows freely. It has also been grown in Florida and other southern states. The culture of the olive has been attempted in England, but without success. Against south walls it lives, with slight protection in winter, in the neighbourhood of London, and in the same way it produces fruit in exceptionally favourable seasons in Devonshire; but it is generally unsuited to the British climate. Even in those countries in which its culture may be profitably pursued the tree is somewhat fastidious as to soil, aspect, and position. It does not succeed well in elevated situations, prefers sloping ground facing and not far removed from the sea, and thrives best in calcareous soil. It is very generally propagated by suckers, but where great care is bestowed on it inarching is practised. It bears an abundant crop only once in several years. There are other species of *Olea* more remarkable for the hardness and usefulness of their timber than for their fruits. *O. verrucosa*, *O. capensis*, and *O. laurifolia*, natives of the Cape of Good Hope, are small trees or shrubs with wood of such density and toughness as to rival in strength and durability iron itself, and they are all named Ironwood by the colonists. The fruit of some of these is eatable. The fruit of *O. americana* is also eatable. The Fragrant Olive of Japan and China—*O. (Osmanthus of some) fragrans*—is a handsome shrub with sweet-scented flowers, which are said to be used by the Chinese for flavouring some kinds of tea. See A. T. Marvin, *The Olive: its Culture in Theory and Practice* (San Francisco, 1888); and United States Consular Report (1890).

Olive, PRINCESS, the title assumed in 1820 by an impudent pretender, Mrs Olivia Serres, who claimed to have been born at Warwick on 3d April 1772, the granddaughter of the Rev. Dr Wilmot, her mother being his only daughter, her father Henry Frederick, Duke of Cumberland, the youngest brother of George III. In 1791 she had married John Thomas Serres, painter, but had separated from him in 1803; and between 1805 and 1819 she had published ten trashy volumes of poetry and fiction. She resembled the royal family, and found some people ready to believe her to be really Princess of Cumberland and Duchess of Lancaster; but she died in poverty, within the 'rules' of the King's Bench, in November 1834. Lavinia, the elder of two daughters by her husband (there seems to have been at least one son by someone else), married Anthony Thomas Ryves, the adopted son of William Combe ('Dr Syntax'), only, however, also to separate. She died 7th December 1871, five years after a jury, in Ryves and Ryves v. the Attorney-general, had decided that Olive Serres was *not* the legitimate daughter of the Duke of

Cumberland, and that eighty-two documents produced in evidence were forgeries.

See the *Life of John Thomas Serres* (1826); *Notes and Queries*, *passim*; and an article by E. Walford in the *Gentleman's Magazine* for August 1873.

Olivente, a mineral, consisting chiefly of arsenic acid and protoxide of copper, with a little phosphoric acid and a little water. It is generally of some dark shade of green, sometimes brown or yellow. It is found along with different ores of copper in Cornwall and elsewhere. It is often crystallised in oblique four-sided prisms, of which the extremities are acutely bevelled, and the obtuse lateral edges sometimes truncated, or in acute double four-sided pyramids; it is sometimes also spherical, kidney-shaped, columnar, or fibrous, which latter variety is known as *wood-arseniate*, and is greenish gray in colour.

Olivenza, a fortified town of Spain, near the Portuguese frontier, 20 miles SSW. of Badajoz. Pop. 7759.

Oliver, the comrade in arms of Roland (q.v.).

Olives, MOUNT OF, called also MOUNT OLIVET, a limestone ridge, lying north and south on the east side of Jerusalem (q.v.), from which it is separated only by the narrow Valley of Jehosaphat. It is called by the modern Arabs Jebel-al-Tôr, and takes its familiar name from a magnificent grove of olive-trees which once stood on its western flank, but has now in great part disappeared. The road to Mount Olivet is through St Stephen's Gate. Immediately beyond, at the foot of the bridge over the brook Kedron, lies the Garden of Gethsemane; and the road here parts into two branches, northwards to Galilee, and eastwards to Jericho. The ridge rises in three principal summits, that to the north being 361 feet above Jerusalem (2725 above the sea), the central summit, crowned with a village (Olivet proper), 286, and the third summit on the south 46 feet. David fled from Absalom by way of the Mount of Olives, which was also the scene of the idolatrous worship established by Solomon. The northern peak is the supposed scene of the appearance of the angels to the disciples after the resurrection, and is remarkable in Jewish history as the place on which Titus formed his encampment in the expedition against the fated city of Jerusalem. But it is around the central peak, which is the Mount of Olives properly so called, that all the most sacred associations of Christian history converge. On the summit stands the Church of the Ascension, on the site of a church built by St Helena; and near it are shown the various places where, according to tradition, our Lord wept over Jerusalem, where the apostles composed the apostles' creed, where our Lord taught them the Lord's Prayer, &c. Near the Church of the Ascension is a mosque and the tomb of a Mohammedan saint.

Olivetans, a religious order of the Roman Catholic Church, whose full title is the Congregation of Our Lady of Mount Olivet. They are an offshoot of the Benedictine Order (q.v.), and were founded in 1313 by Giovanni Tolomei, a native of Siena, and professor of Philosophy in the university of that city, who believed himself to have been miraculously cured of blindness. The order was confirmed by pope John XXII., and Tolomei was chosen the first general.

Olivine. See CHRYSOLITE, IGNEOUS ROCKS.

Olla Podrida (lit., 'putrid pot'), a Spanish national dish, consisting of flesh, fresh and salted, poultry, vegetables, &c., well seasoned with pepper and garlic, and stewed together in a closed pot. The term is applied figuratively to literary productions of very miscellaneous contents. The French

equivalent is *pot-pourri*, and the Scotch *hotch-potch*, both of which, but especially the former, are also employed in a figurative sense.

Ollendorf's System, a method of learning languages, invented by H. G. Ollendorf (1803-65), and designed for those who teach themselves. The grammars are meant to give the student a mastery of the conversational forms of the language, grammatical rules being few.

Ollivier, OLIVIER ÉMILE, French statesman, was born at Marseilles on 2d July 1825, and, having studied law at Paris, began to practise as an advocate in that city. By clever pleading he established a reputation at the bar, and after 1864 acquired influence as a member of the Legislative Assembly. In 1865 the viceroy of Egypt appointed him to a high juridical office in that country. But he still took an active interest in French politics, and in January 1870 Napoleon III. charged him to form a constitutional ministry. But the real authority of the ministers was practically *nil*. Ollivier was an unsuspecting tool in the hands of the Imperialists. 'With a light heart' he rushed his country into the war with Germany, himself to be overthrown, after the first battles, on 9th August. He withdrew to Italy. Ollivier has written books on *Lamartine* (1874) and *Thiers* (1879), and *L'Eglise et l'État au Concile du Vatican* (2 vols. 1879), *Principes et Conduite* (1875), *Nouveau Manuel de Droit Ecclésiastique Français* (1885), and others.

Olmütz, a town and fortress of Moravia, Austria, on the March, 129 miles NNE. of Vienna. The country round can be laid under water, and during 1839-75 the old walls and moats were superseded by an outer cordon of forts. Chief buildings are the 14th-century cathedral (restored 1887); the church of St Maurice (1472), whose organ has 48 stops and 2342 pipes; the noble town-hall, with a steeple 255 feet high; the archiepiscopal palace; and the lofty Trinity column on the Oberring. The former university (1581-1855) is reduced to a theological faculty, with over 200 students and a library of 75,000 volumes. The trade is more important than the manufactures. Pop. 20,176. Olmütz, which in 1640 was superseded by Brünn as the capital of Moravia, suffered severely in both the Thirty and the Seven Years' Wars. In 1848 Ferdinand I. signed his abdication here. See the local history by W. Müller (Vienna, 1882).

Olney, a pleasant little town of Buckinghamshire, on the Ouse, 11 miles W. by N. of Bedford and 10 SE. of Northampton. At the corner of the market-place still stands the house where Cowper (q.v.) lived from 1767 to 1786, writing with John Newton the *Olney Hymns* (1779). The place besides has memories of Scott the commentator, William Carey, and many more missionaries. Brewing and bootmaking are industries. Pop. 2347. See Thomas Wright's *Town of Couper* (1886).

Olonetz, a government of Russia, bounded W. by Finland, NE. by Archangel, and S. by Novgorod and St Petersburg. Area, 57,422 sq. m.; pop. (1883) 327,043. Forests cover 63½ per cent. of the total area. Petrosavodsk is the centre of administration.

Oloron, a town in the French department of Basses-Pyrénées, on the Gave d'Oloron, 22 miles by rail SW. of Pau. It has two interesting Romanesque churches. Pop. 7517.

Olshausen, HERMANN, theologian, was born at Oldeslohe in Holstein, 21st August 1796, studied at Kiel and at Berlin under Neander, and became professor at Berlin (1821), Königsberg (1827), and Erlangen (1834). He died 4th September 1839. His principal work was a complete commentary on the New Testament, completed by Ebrard and

Wiesinger (1830 *et seq.*; Eng. trans. 4 vols. 1847-49; rev. ed. 6 vols. New York, 1856-58). His younger brother Justus (1800-82) was a distinguished Orientalist; and Theodore (1802-69) took a prominent part in the Sleswick-Holstein rising, 1848.

Olympia, the scene of the celebrated Olympic games, is a beautiful valley in Elis, in the Peloponnesus, through which runs the river Alpheus. As a national sanctuary of the Greeks, Olympia contained, within a small space, many of the choicest treasures of Greek art belonging to all periods and states, such as temples, monuments, altars, theatres, and multitudes of images, statues, and votive-offerings of brass and marble. In the time of the elder Pliny there still stood here about 3000 statues. The Sacred Grove (called the *Altis*) of Olympia enclosed a level space about 660 feet long by nearly 580 broad, containing the sanctuaries connected with the games. It was finely wooded, and in its centre stood a clump of sycamores. The *Altis* was crossed from west to east by a road called the 'Pompic Way,' along which all the processions passed. The Alpheus bounded it on the south, the Cladeus, a tributary of the former, on the west, and rocky but gently swelling hills on the north; westward it looked towards the Ionian Sea. The most celebrated building was the *Olympieion*, or *Olympium*, dedicated to Olympian Zeus. It was designed by the architect Libon of Elis in the 6th century B.C., but was not completed for more than a century. It contained a colossal statue of the god, the masterpiece of the sculptor Phidias, and many other splendid figures; its paintings were the work of Panæus, a relative of Phidias. Next to the *Olympieion* ranked the *Heræum*, dedicated to Hera, the wife of Zeus and Queen of Heaven, containing the table on which were placed the garlands prepared for the victors in the games. The *Pelopium*, the *Metroum*, the ten *Thesauri* or Treasuries, built for the reception of the dedicatory offerings of the Greek cities, the temples of Eileithyia and Aphrodite also deserve mention. The *Stadium* and the *Hippodrome*, where the contests took place, stood outside and east of the *Altis*; the *Gymnasium* and *Palæstra* were also outside and to the west. Explorations were undertaken in 1875 by the German government at an annual expense of £8000, and threw much light on the plans of the buildings. Many valuable sculptures, bronzes, coins, and other objects were discovered. The greatest find was the *Hermes* of Praxiteles, a most beautiful and marvellous piece of sculpture. The results of these excavations have been published officially in *Die Ausgrabungen zu Olympia* (5 vols. 1875-81, with 118 plates).

Olympic games were the most splendid national festival of the ancient Greeks, and were celebrated every fifth year in honour of Zeus, the father of the gods, on the plain of Olympia. Their origin goes back far beyond 776 B.C., the year in which the custom of reckoning time by Olympiads (q.v.) began. We may, however, believe that the games became a truly national festival for the first time in that year. At first, it is conjectured, only Peloponnesians resorted to the Olympic games, but gradually the other Greek states were attracted to them, and the festival became *Pan-Hellenic*. Originally, and for a long time, none were allowed to contend except those of pure Hellenic blood; but after the conquest of Greece by the Romans the latter sought and obtained this honour, and both Tiberius and Nero figure in the list of Roman victors. Women—with one exception, the priestess of Demeter Chamyne—were forbidden to be present, on pain of being thrown headlong from the Tÿpean Rock. The games were held at the first full moon of the summer solstice, when first

throughout Elis, and then throughout the rest of Greece, heralds proclaimed the cessation of all intestine hostilities; while the territory of Elis itself was declared inviolable. The competitors were required to undergo a preparatory training for ten months in the gymnasium at Elis, and during the last of these months the gymnasium was almost as numerously attended as the games themselves. Much uncertainty prevails as to the manner in which the contests were distributed over the different days. Krause (*Olympia*, p. 106) suggests the following order: On the first day the great initiatory sacrifices were offered, after which the competitors were properly classed and arranged by the judges, and the contests of the trumpeters took place; the second day was set apart for the boys who competed with each other in foot-races, wrestling, boxing, the pentathlon, the pankration, horse-races; the third and principal day was devoted to the contests of men in foot-races of different kinds (as, for example, the simple race, once over the course; the *diaulos*, in which the competitors had to run the distance twice; and the *dolichos*, in which they had to run it seven or twelve times), wrestling, boxing, the *pankration* (in which all the powers and skill of the combatants were exhibited), and the race of *hoplites*, or men in heavy armour; on the fourth day came off the *pentathlon* (contest of five games—viz. leaping, running, throwing the discus, throwing the spear, and wrestling), the chariot and horse races, and perhaps the contests of the heralds; the fifth day was set apart for processions, sacrifices, and banquets to the victors (called *Olympionikoi*), who were crowned with a garland of wild olive-twigs cut from a sacred tree which grew in the *Altis*, and presented to the assembled people, each with a palm branch in his hand, while the heralds proclaimed his name, and that of his father and country. On his return home he was received with extraordinary distinction: songs were sung in his praise (14 of Pindar's extant lyrics are devoted to *Olympionikoi*); statues were erected to him, both in the *Altis* and in his native city; a place of honour was given him at all public spectacles; he was in general exempted from public taxes, and at Athens was boarded at the expense of the state in the *Prytaneion*. The regulation of the games belonged to the Eleans, from whom were chosen the *hellenodikai*, or judges, whose number varied. At first there were only two, but as the games became more and more national, and consequently more numerous, they were gradually increased to ten, sometimes even to twelve. They were instructed in their duties for ten months beforehand at Elis, and held their office only for one year. The officers who executed their commands were called *alytai*, and were under the presidency of an *alytarch*.

See Krause's *Olympia* (1838); Bötticher's *Olympia* (1882); Baumeister's *Denkmäler*; Lalou and Monceaux, *Restauration de l'Olympie* (1889); and Curtius and Adler, *Olympia die Ergebnisse der Ausgrabungen* (1891).

Olympia, capital of Washington state, on a peninsula at the south end of Puget's Sound, some 65 miles from the Pacific Ocean, and 121 miles by rail N. of Portland, Oregon. The Des Chutes River, which enters the sound here, provides abundant water-power, and the town has flour and saw mills, boot-factories, &c. Pop. 3500.

Olympiad, the name given to the period of four years that elapsed between two successive celebrations of the Olympic games, a mode of reckoning among the Greeks apparently first employed systematically by Alexandrian writers in the 3d century B.C. It is used only by writers, and is never found on coins and very seldom on inscriptions. The first recorded olympiad dates

from the 21st or 22d of July 776 B.C., and is frequently referred to as the Olympiad of Corœbus; for historians, instead of referring to the olympiad by its number, frequently designate it by the name of the winner of the foot-race in the Olympic games belonging to that period. The first year of our present era (1 A.D.) corresponded to the last half of the fourth year of the 194th with the first half of the first year of the 195th olympiad. See CHRONOLOGY.

Olympias, the wife of Philip II., king of Macedonia, and mother of Alexander the Great. She was the daughter of Neoptolemus I., king of Epirus. She was a woman of great vigour and capacity, but was passionate, jealous, and ambitious. When Philip married Cleopatra, niece of Attalus, she left Macedonia, and she was believed to have instigated his assassination by Pausanias (337 B.C.). On the accession of Alexander she returned to Macedonia, and brought about the murder of Cleopatra and her daughter. Alexander treated her with respect, but he never allowed her to meddle with his political schemes. After his death she obtained the support of Polysperchon, and in 317 the pair defeated and put to death Philip Arrhidæus, the weak-minded step-brother and successor of Alexander, together with his wife Eurydice. Her cruelties soon alienated the minds of the people, whereupon Cassander besieged her in Pydna, and on its surrender put her to death, 316 B.C.

Olympiodorus, one of the latest of the Alexandrian Neoplatonists, flourished in the first half of the 6th century after Christ, during the reign of the Emperor Justinian. Regarding his life nothing is known. Of his writings we possess a *Life of Plato*, with commentaries or scholia on the *Gorgias*, *Philebus*, *Phædo*, and *Alcibiades I*. In these he appears as an acute and vigorous thinker and as a man of great erudition.—Another Olympiodorus, of the Peripatetic school, flourished in Alexandria in the 5th century B.C., and was the teacher of Proclus (q.v.).—A third Olympiodorus, from Thebes in Egypt, wrote in Greek a history of the western empire from 407 to 425 A.D., abridged by Photius.

Olympus, the ancient name of several mountains or chains of mountains—e.g. in Mysia, Cyprus, Lycia, Elis, Laconia, Arcadia, and one, the most famous of all, between Thessaly and Macedonia. Its eastern side, which fronts the sea, shows a line of vast precipices, cleft by ravines filled with forest trees. Oak, chestnut, beech, and plane trees are scattered along its base, and higher up grow forests of pine, as in the days of the old poets of Greece and Rome. Its highest peak is 9750 feet above the sea. It was regarded by the ancient Greeks as the chief abode of the gods, and the palace of Zeus was supposed to stand upon its broad summit. According to Greek legend it was formerly connected with Ossa, but was separated from it by an earthquake, allowing a passage for the Peneus through the narrow vale of Tempe to the sea. The philosophers afterwards transferred the abode of the gods to the planetary spheres.

Om is a Sanskrit word which, on account of the mystical notions that even at an early date of Hindu civilisation were connected with it, acquired much importance in the development of Hindu religion. Its original sense is that of emphatic or solemn affirmation or assent. Later it became the auspicious word with which the spiritual teacher had to begin, and the pupil had to end, each lesson of his reading of the Veda. And ultimately (as equal to *Aum*) it came to be regarded as an abbreviated method of naming the Hindu Trinity. In the Lamaist form of Buddhism the

'formula of six syllables,' *Om mani padme hum*, which is variously interpreted, is the most solemn and sacred of invocations; is the first thing taught to Tibetan and Mongolian children, the last prayer breathed by the dying man. It is found engraved on rocks, flags, and praying-wheels, and is looked on as the essence of religion and wisdom, and the means of attaining eternal bliss.

Omagh (Gael. *Oigh magh*, 'seat of the chiefs'), the county town of Tyrone, on the Strule, 34 miles S. of Londonderry and 110 NNW. of Dublin. It grew up around an abbey founded in 792, but is first heard of as a fortress in the end of the 15th century, when it was forced to surrender to the English. It formed part of James I.'s 'Plantation' grants, and was strongly garrisoned by Mountjoy. On its being evacuated by the troops of James II. in 1689 it was partially burned, and a second fire in 1743 completed its destruction. But it has been well rebuilt, and is now a neat and prosperous town. Pop. (1851) 3385; (1881) 4138.

Omaha, the chief city of Nebraska, is on the right bank of the Missouri, by rail 774 miles W. of Chicago and 501 NW. of St. Louis. It is the terminus of four important railways, and the Missouri is spanned by a bridge (2750 feet, cost \$1,250,000) to Council Bluffs, where a number of others start. The city is built on a plateau 80 feet above the river, and has wide streets, of which in 1889 there were 103 miles graded and 52 paved, while there were 73 miles of sewerage and 94 miles of street railways. A belt line of railway encircles the city. There are numerous large and costly buildings, including the city hall, United States court-house and post-office, Chamber of Commerce (1885) and Exposition (1896) buildings, Creighton College, and the high school; and in 1889 the city also contained a medical college, sixty public and private school buildings, and ninety-one churches. The manufactures include linseed-oil, boilers, safes, &c.; but above all Omaha possesses the largest silver-smelting works in the world, and the third largest pork-packing business in the United States (number of cattle slaughtered in 1889, 234,427; of hogs, 1,020,089; of sheep, 49,249). In 1889 the value of manufactured products was \$23,515,000, exclusive of sales of wholesale dealers, \$44,910,000; the clearing-house returns amounted to \$208,681,000. There are eight daily and thirteen weekly newspapers published in English, German, Swedish, Danish, and Bohemian. Near the city are the headquarters of the military department of the Platte, embracing 82½ acres, and containing commodious barracks. Omaha was founded in 1854. Pop. (1860) 1912; (1870) 16,083; (1880) 30,518; (1890) 140,452.

Omahas, a tribe of American Indians, of the Dakota stock, settled in northern Nebraska, and numbering about 1200.

Oman, the most eastern portion of Arabia, a strip of maritime territory, extending between the Strait of Ormuz and Ras-el-Had, and bounded on the SW. by the deserts of the interior. At a distance of from 20 to 45 miles inland a chain of mountains runs parallel to the coast, reaching 6000 feet in Jebel Akhdar. There are some richly fertile tracts in this region, especially where water exists for irrigation. The coast is hot and not very healthy. This part of Arabia is under the rule of the sultan of Muscat (q.v.).

Omar. See CALIF.

Omar Khayyām, the astronomer-poet of Persia, was born at Nishapur, the capital of Khorassan, about the middle of the 11th century, and took his *takhallus* or poetical name, 'Khayyām,' from his father's calling of tent-maker. He

was brought up under the great Sunni teacher, Imám Muaffik, and formed a close friendship with two of his fellow-pupils, Nizam-ul-Mulk and Hassan-ibn-Sabbah, of whom the one became vizier to the sultan Alp-Arslan, and the other founded the sect of the Assassins. Omar himself had an offer from his old friend of a place at court, but accepted instead a yearly pension of 1200 gold pieces. He, however, obeyed the summons of Malik Shah to Merv, and during his sultanate helped to reform the calendar. The result was the *Jalali* era—'a computation of time,' says Gibbon, 'which surpasses the Julian, and approaches the accuracy of the Gregorian style.' To appease the *odium theologicum* that he had roused against himself he is said to have made the pilgrimage to Mecca; and he died in 1122 at Nishapur, where the north wind, as he predicted, still scatters roses on his tomb.

Of some mathematical treatises by him in Arabic, one on algebra has been edited and translated by Woepke (Paris, 1851); and it was almost solely as a mathematician that he was known to the western world, until in 1859 Edward FitzGerald (q.v.) published his 'translation' of seventy-five of his *Rubáiyát* or quatrains. The poet of Agnosticism, such was Omar Khayyám, though some in his poetry see nothing save the wine-cup and roses, and others read into it that Sufi mysticism with which, indeed, it was largely adulterated long after Omar's death. He was a true poet; yet his fate has been that of the man in the story who lost his shadow, to find it years afterwards grown to a great nobleman, through whom he perished. For FitzGerald's translation is so infinitely finer than the original that the value of the latter is such mainly as attaches to Chaucer's or Shakespeare's prototypes.

There are editions of the *Rubáiyát* by Nicolas (464 quatrains; Paris, 1867), Monbir Muhammad Sadik Ali (nearly 800 quatrains; Lucknow, 1878), and E. H. Whinfield (253 quatrains; Lond. 1883), who also translated them into very literal English verse (1882). A prose translation by Justin H. McCarthy (1889) has little to recommend it. See an article by Professor E. Cowell in the *Calcutta Review* (January 1858), and vol. iii. of Fitzgerald's *Letters and Literary Remains* (1889).

Omar Pasha, Turkish general, was born at Plaski, in Croatia, in 1806 (according to some authorities, in 1811). His real name was Michael Lattas; he was educated for the Austrian army at the military school of Thurn, near Carlsstadt. Having by a breach of discipline rendered himself liable to punishment, he fled to Bosnia, and, embracing Mohanmedanism, gained through his beautiful caligraphy the post of writing-master to Abdul-Medjid, the heir to the Ottoman throne. On his pupil's accession in 1839 Omar Pasha was raised to the rank of colonel, and in 1842 appointed military governor of the Lebanon. In 1843 he displayed considerable skill and energy in suppressing an insurrection in Albania, and in the following years others in Bosnia and Kurdistan. On the invasion of the Danubian Principalities by the Russians in 1853 Omar Pasha collected an army of 60,000 men, and, crossing the Danube in presence of the enemy, intrenched himself at Kalafat, where he successfully withstood the Russians; after they withdrew from the Principalities Omar Pasha entered Bucharest in triumph in August 1854. On 9th February 1855 he embarked for the Crimea, and on the 17th of the same month repulsed with great loss 40,000 Russians who attacked him at Eupatoria. He was soon afterwards (October 3, 1855) sent to relieve Kars, but arrived too late. In September 1861 he was charged to pacify Bosnia and Herzegovina, which were again in insurrection. This being accomplished, he attacked the

Montenegrins, captured Cetinje, and overran the country in 1862. He died 18th April 1871.

Ombre (through the Fr. from Span. *hombre*, 'man'), a game of cards borrowed from the Spaniards, and usually played by three persons, though sometimes by two and by five. The game is played with 40 cards (the eights, nines, and tens having been removed), and each player receives nine cards, three by three. The game is often referred to in English 18th-century literature.

O'Meara, BARRY EDWARD, physician to Napoleon on St Helena, was born in Ireland in 1786. He first served as surgeon in the army, but was dismissed the service in 1808 for a discreditable share in a duel at Messina. Later he entered the naval department, and was on board the *Bellerophon* when Napoleon surrendered to Captain Maitland. He pleased the great exile, and accompanied him as his private physician to St Helena. He took part with Napoleon in his squabbles with the governor, Sir Hudson Lowe, and was imprisoned and compelled to resign his post in 1818. On his return to England he asserted in a letter to the Admiralty that Sir Hudson Lowe had dark designs against his captive's life, and had attempted insidiously to corrupt himself. For this monstrous charge he was at once dismissed the service. His *Napoleon in Exile* (1822) made a great sensation, and is still valuable if read with caution. He died obscure in London, 3d June 1836.

Omelet (Fr. *Omelette*), an exquisite dish when exquisitely prepared, and like most good things perfectly simple. Break fresh eggs (not less than two or more than five) in a basin with a pinch of salt and pepper, beat for two seconds, pour into an omelet-pan in which butter (1 to 2 oz.) is boiling. Stir till the mixture sets, fry till one side is brown, double over in half and serve immediately. Savoury omelets are made by adding to the eggs finely-minced herbs, ham, bacon, fish, or game. For sweet omelets use a little sugar instead of pepper in the mixture, and place a spoonful of preserved fruit on the omelet before folding over. The word is said, by Littré and by Skeat, to be derived from the Old French *Alemelle* (a thin flat plate), first corrupted to *Amelette*, then *Omelette*.

Omen (perhaps originally *osmen*, for *ausmen*; root, *audio*, 'I hear'); also PRODIGY (Lat. *prodigium* for *prodicium*, from *prodo*), names given by the Romans to signs by which approaching good or bad fortune was supposed to be indicated. The former applied particularly to signs received by the ear and spoken words; the latter, to phenomena and occurrences, such as monstrous births, the appearance of snakes, the striking of the foot against a stone, the breaking of a shoe-tie, sneezing, and the like. It was supposed that evil indicated as approaching might be averted by various means, as by sacrifices, or by the utterance of certain magic formulas; or by an extempore felicity of interpretation, as when Cæsar, having fallen upon the ground on landing in Africa, exclaimed: 'I take possession of thee, Africa.' Occasionally we read of a reckless disregard of omens; as, for example, when P. Claudius in the first Punic war caused the sacred chickens, which refused to leave their cage, to be pitched into the sea, saying: 'If they won't eat, let them drink.' The belief in omens in one form or other has existed in all ages and countries, and traces of it linger in the folklore of all countries. And, indeed, there is no little philosophy in the Scotch proverb: 'Them that follow *freits*, *freits* follow.' See AUGURIES, DIVINATION, and FOLKLORE.

Omuchand. See CLIVE.

Ommiades. See CALIF.

Omnibuses, vehicles 'for all,' the well-known public conveyances. So long since as 1662 Blaise Pascal, the author of the *Lettres Provinciales*, assisted by some noblemen, obtained a patent from the French king for the privilege of running public coaches, containing six persons, each along certain streets of Paris, and preserving its own route, for five sous per passenger. For two years the scheme proved a great success, but the death of Pascal and other causes occasioned its disuse. The first omnibus, built in Paris in 1820, was drawn by three horses, and soon became popular. Paris has also an excellent system of railway buses to contain eight passengers inside; the English railways have recently followed this practice. In England at the beginning of the 19th century stage-coaches were used by business men to reach London from its suburbs. These were succeeded by the omnibuses started in London, July 1829, by Mr Shillibeer, formerly a coachmaker in Paris, and were drawn by three horses, conveying twenty-two persons inside. Smaller and more convenient buses were introduced in 1849, which conveyed twelve passengers inside and two out. Outside seats along the centre of the roof followed in 1857, and the vehicle was subsequently much improved upon by Mr Miller of Hammersmith. Large omnibuses are in use in Glasgow and Manchester and other large towns, and the three-horse omnibus was re-introduced in London on the route from Charing Cross to Portland Road. Many recent improvements have been made in the arrangement of seats outside facing forward, the greater accommodation of the interior, and the lightness of the vehicle. The London General Omnibus Company, founded in 1855, took over 580 omnibuses. In 1891 it had 860 omnibuses, employing 9600 horses and 3000 men. Each bus runs about 12 miles daily. The company build for their own use about 90 or 100 buses annually. The average weight of an omnibus is 30 cwt., and the cost about £150. The more recent London Road Car Company, whose opposition to the older company has resulted in a great reduction of fares, runs 217 buses, and employs 2619 horses. The average charge per mile by bus is less than 1d.

Omnium, JACOB. See HIGGINS.

Omphacite (Gr. *omphaka*, 'unripe grape'), a grass-green granular variety of Pyroxene (q.v.), one of the constituents of Eclogite (q.v.).

Omphale. See HERCULES.

Omsk, chief town of the Russian province of Akmolinsk, stands at the confluence of the Om with the Irtysh, 1800 miles E. of Moscow. It was built in 1716 as a defence against the Kirghiz; but is now of no importance as a fortress. It is the seat of administration for the Steppe provinces of western Asia. It has a military academy, a Greek and a Roman Catholic cathedral, a museum, governor's palace, &c., and a declining trade with the Kirghiz in cattle, hides, furs, and tea. Pop. (1887) 33,847.

On. See HELIOPOLIS.

Onager. See ASS, BALLISTA.

Onagraceæ, ONAGRARIÆ, or CENOTHERACEÆ, a natural order of exogenous plants, consisting chiefly of herbaceous plants, but including also a few shrubs; with simple leaves and axillary or terminal flowers. There are about 450 known species, natives chiefly of temperate climates, among which are some much cultivated for the beauty of their flowers, particularly those of the genera *Fuchsia*, *Cenothera* (Evening Primrose), *Clarkia*, and *Godetia*. The British genera are *Epilobium* (Willowherb) and *Circæa* (Enchanter's Night-

shade). A few species produce edible berries, and the roots of one or two are eatable; but none are of economic importance. The root of *Imarda alternifolia*, found in the marshes of Carolina, and called *Bowman's Root*, is emetic. Some species of *Jussiaea* are used in dyeing in Brazil.

One'ga, a seaport in the north of Russia, stands at the point where the river Onega empties into the White Sea, 87 miles SW. of Archangel. It is entered by about 120 vessels annually of a gross burden of 21,000 tons. Pop. 2547.

Onega, LAKE, in the north of Russia, after Ladoga, to the north-east of which it lies, the largest lake in Europe, is 50 miles in greatest breadth, 146 miles in length, and 1000 feet in depth in parts. Area, 3764 sq. m. It is fed by numerous rivers; but its only outlet is the river Swir, which flows south-west into Lake Ladoga. The northern end is studded with islands and deeply indented with bays. The shores in other parts are flat and low and regular. Although the water is ice-bound generally for 156 days in the year, the lake is the scene of busy traffic at other seasons. Communication is promoted by a canal cut parallel to the southern shore. Fish abound. Mirages are frequent at times. Surveys were completed in 1890 for a canal to connect Lake Onega with the White Sea; it will be 145 miles long, 10 feet deep, and 63 wide, and is expected to cost only £800,000, the greater part of the distance being along natural waterways.

Oneglia, a town on the Gulf of Genoa, 3 miles NE. of Porto Maurizio by rail. Pop. 7286.

Onelda. See PERFECTIONISTS.

Oneldas. See IROQUOIS.

O'Neill, HUGH. See TYRONE.

Onion (Fr. *oignon*, from Lat. *unio*, 'a pearl,' but in Columella signifying a kind of onion), the name given to a few species of the genus *Allium* (q.v.), and particularly to *A. cepa* (Lat. *cepa*), a biennial bulbous-rooted plant. The bulb is simple, and in the common variety is solitary, showing little tendency to produce lateral bulbs. The native country of the onion is shrouded in obscurity. It is supposed to be indigenous to India, whence it passed into Egypt, where it was cultivated 2000 years before the Christian era. Thence probably it was transmitted to Greece and Italy, and gradually spread over Europe, in most countries of which it has been cultivated from time immemorial. The onion contains a white acrid volatile oil, holding sulphur in solution, albumen, uncrystallisable sugar and mucilage, phosphoric acid, both free and combined with lime, acetic acid, citrate of lime, and lignin. The acrid qualities, while present in every part of the plant, are most concentrated in the bulb. When it is cultivated in warm countries the acridity decreases, while the saccharine qualities increase; hence the comparative mildness of Spanish and Portuguese onions. So mild and sweet are these that the peasantry of Spain and Portugal eat them raw with bread. Indeed, the onion forms a very important article of food with the poor of those countries. It is very nutritious and easily digested, yet does not agree with all stomachs when cooked otherwise than boiled. In boiling, the essential oil is dissipated and the onion thereby rendered more agreeable to delicate stomachs. The onion is stimulant, diuretic, expectorant, and rubefacient. The acid of the juice has the reputation of dissolving calculus in the bladder. The pulp of the bulb by fermentation is converted into vinegar, and with the addition of dregs of beer yields by distillation an alcoholic liquor. The pulp of roasted onion with olive-oil forms an excellent anodyne and emollient poultice to suppurating tumours. There are

many varieties of the onion in cultivation in Britain, which have been obtained by natural seminal variation and by careful selection. In recent years great progress has been made by these means in the direction of increasing the size of the bulb, and there are now varieties which under good cultivation surpass even the large Spanish onion of the shops in size, but they lack the delicate flavour of the latter. There is great diversity in the keeping qualities of the bulbs of the different varieties. Those having small, compact bulbs keep best and for the longest time. By a proper selection of sorts home-grown onions may be had either green or matured all the year round. The Tripoli Trebon and White Lisbon are sown in August to supply green onions in spring; and if transplanted from the seed-bed to rich ground at that season they grow to very large size by September, when they reach maturity. James's Keeping, Strasburg, and Brown Globe are varieties which keep long and are sown in February and March for the main crop. The onion delights in rich, moist soil deeply trenched; when very large bulbs are desired it is hardly possible to overdo the ground with manure. When the crop ripens, which is known by the central leaves ceasing to grow and the lower ones going to decay, the bulbs are taken up and spread out thinly on a dry surface in the open air till they are quite dry; they are then stored in a loft where, in mild weather, they may have plenty of air but be protected from frost and damp.—The Potato-onion, so called because it reproduces itself underground by division of the bulb, is a perennial variety of the onion which also bears the names Egyptian and Ground Onion. It is much favoured by cottagers, in Scotland particularly. A legend that it was first brought to Britain by the British army from Egypt in 1805 is without foundation, as it was cultivated long before that time in the country. Pickling onions are usually obtained by sowing the small silver-skinned variety on poor soil in spring. The Tree-onion, so named because, instead of producing seeds after flowering, the ovaries develop viviparous bulbs by which the plant is propagated, is rarely cultivated except as a curiosity. The Welsh Onion, or Cibol (*A. fistulosum*), produces no bulb, but merely a fleshy stem like the leek. It is a native of Siberia, and being very hardy was formerly grown in gardens to supply green onion tops in spring for salads and the flavouring of soups and sauces. Being rather coarse in flavour, however, it has been superseded by the milder flavoured kinds, which are sown in August. It is the true *syboe* of the Scotch, although the term has come to be applied to green or young onions of whatsoever kind.

Onkelos, the reputed author of an Aramaic Targum of the Pentateuch. See TARGUM.

Onomacritus, a religious poet of ancient Greece, lived at Athens in the time of the Pisistratidæ. He exercised great influence on the development of the Orphic mysteries, and collected the prophecies or oracles of Musæus (q.v.), but was banished by Hipparchus for falsifying them. He followed the Pisistratidæ into Persia, and was by them induced to repeat to Xerxes all the ancient sayings that seemed to favour his invasion of Greece. He helped to arrange the Homeric poems, and is suspected of having introduced interpolations into the text of them.

Onomatopœia, a term used in philology to denote the formation of words in imitation of natural sounds, as in *cuckoo*, *pee-wit*, and the like. See PHILOLOGY.

Onondagas. See IROQUOIS.

Ontario, the easternmost and smallest (7240 sq. m.) of the five great lakes of North America,

receives at its south-west corner the waters of the upper lakes by the Niagara River, and at its north-east corner it issues into the St Lawrence. Its surface, which is subject to periodical variations (4 to 7 years) of about $3\frac{1}{2}$ feet, and which it is attempted to explain on the supposition of there being a subterranean river out of the lake, is $326\frac{3}{4}$ feet below the surface of Lake Erie and $246\frac{1}{4}$ feet above the ocean-level. Its mean depth is about 300, its maximum depth 738 feet. It is 190 miles long, 55 in its widest part, and over 500 in circumference. It has many thriving ports, of which the chief are Kingston, Coburg, Port Hope, Toronto, and Hamilton on the Canadian shore, and Sackett's Harbor, Oswego, and Charlotte in the United States. It is connected with Lake Erie by the Welland Canal, with the Erie Canal and river Hudson by the Oswego Canal, and by the Rideau Canal with the Ottawa; and in 1890 a ship-railway (69 miles) was projected, to connect this lake with Lake Huron. Lake Ontario is subject to violent storms, and it is probably owing chiefly to the constant agitation of its waters that it freezes only for a few miles from the shore. The shores are generally very flat, but the Bay of Quinte, near Kingston, a long, crooked arm of the lake, which stretches about 50 miles, possesses some attractive scenery. Burlington Bay, on which Hamilton lies, is a large basin almost enclosed by a natural bank of sand, which forms a beautiful drive. See Crosman's *Chart* (1888).

Ontario, the most populous and wealthy province of the Dominion of Canada, is bounded NE. and E. by Labrador and Quebec, SE., S., and SW. by the St Lawrence and the Great Lakes, N. by St James' Bay, and NW. and W. by Keewatin and Manitoba. Area, 222,000 sq. m.; pop. (1881) 1,923,228; (1891) 2,114,475. The province extends from about $74^{\circ} 50'$ to $95^{\circ} W.$ long. The surface is generally undulating, and there are no elevations of any considerable height. The Laurentian Hills run westward from the Thousand Islands near Kingston, and extend north of Lake Simcoe, forming the coasts of Georgian Bay and Lake Huron. In the middle of the province the high land forms a watershed, separating the rivers flowing into the Great Lakes from those entering the Ottawa and the St Lawrence. The principal rivers of Ontario are tributaries of the Ottawa, which forms part of its north-eastern boundary. The St Lawrence forms the boundary of the eastern portion of the province, dividing it from the United States. Bounded by the Great Lakes, among its smaller lakes are Simcoe, Nipissing, Nipigon, and many others. Ontario is largely an agricultural country, and its resources are very great. Immense crops are raised of all the products of a temperate climate, and in the south-west corner of the province Indian corn is a regular crop, and grapes, peaches, and tomatoes are grown and ripen in the open air. In addition to arable farming, stock-raising, dairy-farming, and fruit-growing are important industries. In minerals the country is also rich. Iron is found in many parts; copper, lead, plumbago, apatite, antimony, arsenic, gypsum, marble, and building-stone are abundant; there are also gold and silver deposits—the latter very extensive in the country along the shores of Lake Superior and west to the Lake of the Woods. The nickel deposits at Sudbury are probably the most extensive in the world. The petroleum-wells, in the south-west part of the province, are yielding immense and apparently inexhaustible supplies; the same may be said of the salt-wells on the shores of Lake Huron. Largely owing to the favourable position which the province occupies with regard to water-power—although steam-power is established to a large extent, coal being obtained

without difficulty by means of the lakes, from Pennsylvania, and also from Nova Scotia—the manufactures are numerous and abundant.

The principal manufactures are agricultural implements, iron and woodware, wagons and carriages, railway rolling-stock (including locomotives), cottons and woollens, leather, furniture, flax, ordinary iron and hardware, paper, soap, woodenware, &c. The most thickly populated part of Ontario more nearly resembles England than any of the other colonies. There is only one large city, Toronto, which contains nearly 200,000 inhabitants; but smaller cities and towns, such as Ottawa (44,000 inhabitants), Hamilton (43,000), London (27,000), Kingston (17,000), Guelph (11,000), St Catherine's (11,000), Brantford (13,000), St Thomas, Peterborough, Port Hope, Woodstock, Galt, Lindsay, Paris, and Port Arthur, are scattered all over the province, and are usually manufacturing or agricultural centres. The farms in these districts are well cultivated and fenced, with houses as a rule superior to those found in Great Britain. Ontario has a perfect network of railways (between 5000 and 6000 miles), which has proved of great advantage in the development of the manufacturing and agricultural industries; and in summer it is supplemented by the means of transport provided by the lakes and by the magnificent system of canals on the St Lawrence. The revenue of Ontario is about \$5,000,000, made up of subsidies and contributions from the Dominion treasury, land and lumber sales, licenses, stamps, &c. The expenditure is invariably under the revenue, and the finances of the province are in a thoroughly satisfactory condition.

The value of the imports in 1889 was \$42,292,819, including \$24,912,245 from the United States and \$14,542,782 from Great Britain. The value of the exports in the same year was \$30,336,698, of which \$23,449,821 went to the United States and \$3,728,174 to Great Britain. The exports of the produce of the province may be divided into the following heads: Minerals, \$333,352; lumber, \$397,885; animals and their produce, \$6,762,397; agricultural products, \$8,628,195; manufactures, \$2,012,977; and miscellaneous, \$475,680.

The school system of Ontario is admirable, and is under the control of a minister of Education, who is always a member of the Provincial Cabinet. The schools are supported by a tax on property, with state grants, and are free to all. Roman Catholics may, if they think proper, establish separate schools, and are then exempted from supporting the public schools, receiving a separate grant from government. The children attending the schools in 1887 were 493,212, out of a total school population of 611,212. There are many universities and colleges, and the facilities for higher education are quite equal to those provided for elementary purposes. The municipal system is one of the most perfect in the world, and affords a pattern which has been followed in many other countries. The public affairs are administered by a lieutenant-governor, an executive council of five members, and a legislative assembly of 90 members elected every four years. In the Dominion parliament the province is represented by 24 members in the Senate and 92 members in the House of Commons. In Ontario the Protestant religious bodies predominate; the Methodists are the most numerous, followed by the Presbyterians, then by the Church of England.

History.—Ontario was largely founded by the immigration of United Empire loyalists into Canada after the declaration of independence of the United States. It was made into a separate province and called Upper Canada in 1791 (see article CANADA). The two provinces were reunited in 1840, as the result of the disturbances in

1837 and 1838, and remained in that position until confederation in the year 1867, when the province received the name of Ontario.

Ontology. See METAPHYSICS, PHILOSOPHY.

Onus Probandi, i.e. the burden of proof, is often a difficult question in litigation; but as a rule the plaintiff who institutes the suit is bound to give proof of the allegations on which he relies.

Onyx, an agate formed of alternating white and black, or white and dark-brown stripes of chalcedony. More rarely a third colour of stripes occurs. The finest specimens are brought from India. Onyx is in much esteem for ornamental purposes. The ancients valued it very highly, and used it much for cameos. Many of the finest cameos in existence are of onyx. The name onyx, however, appears to have been applied by the ancients more extensively than it now is, and even to striped calcareous alabaster, such as is now called Onyx Marble. The *Sardonix* of the ancients is a variety of onyx in which white stripes alternate with stripes of a dark-red variety of carnelian, called *sard* or *sarda*. It is one of the rarest and most beautiful kinds of onyx, and is more valued than carnelian.

Oodeypore. See UDAIPUR.

Oojain. See UJJAIN.

Ooklep. See CAPE COLONY, Vol. II. p. 735.

Oolachan. See CANDLE-FISH.

Oolite (Gr., 'egg-stone'), a variety of limestone, composed of spherical granules of calcic carbonate, which have a concentric and often a fibrous radiating structure. In many cases these granules contain a nucleus or kernel of some foreign substance, such as a grain of sand, round which the successive layers or encrusting coats of calcic carbonate have been formed. Granules of this nature are seen forming in the springs of Carlsbad. A similar oolitic structure has been observed occasionally in the coral-rock forming the surface of modern coral-reefs—which seems to owe its origin to the movement to and fro of grains of coral sand in pools or sheltered places in which the water is highly saturated with carbonate of lime, derived from the decomposition of dead coral. The coarser varieties of oolite are termed *Peastone* or *Pisolite*.—For Oolite as the name for a group of strata, see JURASSIC SYSTEM.

Oonalashka. See ALEUTIAN ISLANDS.

Oori, LIMPOPO, or CROCODILE RIVER, a river of south-eastern Africa, has its sources in the heart of the Transvaal, between Pretoria and Potchefstroom, describes a huge curve to the north, and joins the Indian Ocean a little north of Delagoa Bay. Its course exceeds 800 miles, and it has numerous tributaries, the most important being the Olifant from the right. The Limpopo has been ascended 50 miles by steamboat; but its upper reaches are obstructed by rapids and falls.

Oosterhout, a Dutch town in North Brabant, 6 miles NE. of Breda, with sugar-factories, tanneries, breweries, potteries. Pop. 10,911.

Oosterzee, JAN JAKOB VAN, theologian, was born in 1817 at Rotterdam, studied at Utrecht, was a pastor in Rotterdam, and in 1862 became a theological professor at Utrecht, being the leader of the Evangelical school in Holland. He died 29th July 1882. He wrote many works, amongst them a *Life of Christ*, a *Christology*, a work on John's Gospel (in German), commentaries on Luke and the Pastoral Epistles in Lange's Commentary; also a *Theology of the New Testament* (1867; Eng. trans. 1870, 4th ed. 1882); *Christian Dogmatics* (1872; trans. 1874); *Moses* (trans. 1876); *Practical Theology* (trans. 1878).

Ootacamund, or **UTAKAMAND**, the chief town in the Neilgherry (q.v.) Hills, the principal sanatorium of the Madras Presidency, and the summer headquarters of the governor of Madras. It stands on a plateau, in an amphitheatre surrounded by hills, 7228 feet above the sea, 350 miles from Madras city, and 24 from the nearest railway station on the Madras line. There are a public library (1859), the Lawrence Asylum (1858) for the children of British soldiers, and botanical gardens. The mean annual temperature is 58° F. The first house was built in 1821. Pop. 12,335.

Ooze, a term technically applied to some kinds of deposits found covering the bottom of the deeper parts of the sea. It is not only the depth of the water, but the distance from the land which determines the occurrence of ooze. As we pass from the shore out to sea we find a succession of deposits, shingle, sandy mud, mud—all derived from the land; but at a distance varying from 60 to 300 nautical miles from the shore, and at a depth of 2000 feet or more, lie the various oozes, which consist of the remains of numerous small organisms, but especially of the shells of Foraminifera. A whitish deposit, containing enormous numbers of Globigerina shells, which in dying have sunk from the surface, is very widely distributed till depths of about 2000 fathoms are approached. There the Globigerina ooze wanes away, and is replaced in the deeper regions by so-called 'red clay.' At the surface above there are of course here as elsewhere abundant Foraminifera which still doubtless sink, but the physical conditions of the great depths are such that their shells are dissolved in falling. But in certain of the deepest parts—e.g. at 4575 fathoms—the *Challenger* explorers found another kind of ooze, composed of the flint shells of Radiolarians. Besides this, in other regions the shells of Pteropods and Diatoms are abundant enough to form a characteristic ooze.

It is to be understood, however, that the various oozes (Globigerina, Radiolarian, Pteropod, Diatom, &c.) pass into one another, and that the names usually express simply the predominance of one or other kind of shell, and also that the colours—white, yellow, brown, and red—mainly denote the proportion in which the 'red clay' is present. The latter owes its colour to the oxides of iron and manganese, and is composed of disintegrated materials of volcanic origin, such as pumice, and also of meteoric dust. These, after being carried by winds and floated on ocean currents, sink and are distributed at the bottom. But as to the ooze in the strict sense, it ought also to be noted that the dead or dying organic material, which the rain of these organisms brings to the bottom, serves as the fundamental food-supply of deep-sea animals, while the shells not only accumulate as ooze, but aid in the elevation of submarine volcano tops to the level at which corals can grow. Finally, the results of the ooze of incalculably distant ages are seen in the chalk cliffs often obviously composed of Foraminifera, or in such Radiolarian deposits as Barbadoes Earth. See **CHALK**, **DIATOMS**, **FORAMINIFERA**, **GLOBIGERINA**, **PTEROPOD**, **RADIOLARIAN**, **SEA**, and the concluding volume of the *Challenger* Reports by Murray and Renard.

Opacite, name given by petrologists to minute black, opaque, amorphous aggregates, grains, and patches of indeterminate mineral matter, which are seen in many igneous rocks when these are viewed in thin slices under the microscope. Opacite is probably in most cases hematite, limonite, magnetite, or other iron oxide, and is a product of the chemical alteration of one or other of the original mineral constituents of the rock in which it occurs.

Opah, or **KING-FISH** (*Lampris luna*), a fish of the family Coryphænidæ or 'Dolphins,' order Acanthopterygii. The body is compressed laterally and deep, and is covered with small deciduous scales. The cleft of the mouth is narrow, and there are no teeth. The dorsal fin is single and has no spinous portion; the pectoral and ventral fins are falciform and of nearly equal length. The tail is forked. The lateral line has a strong curve behind the head, and becomes straight about midway between the eye and the root of the tail. This fish is beautifully coloured; the back is bluish green; the sides violet, becoming red underneath; round or oval silvery spots are scattered all over the body; the fins and tail are deep scarlet. It is found only occasionally near shore. It prefers the deeper waters of the North Sea, being found off

Opah (*Lampris luna*).

Norway, the British Isles, Iceland, Newfoundland, and especially near the Azores and Madeira. It is rare in the Mediterranean, and has not been recorded off Greenland or east of the North Cape in Norway. Specimens have been caught measuring 6 feet in length; one of 4 feet 5 inches weighed 140 lb. The flesh is red or yellowish in colour, and is excellent to eat. Its food, so far as is known, consists of cuttle-fish and other cephalopods. Other names applied to it are Sun-fish (a name also applied to Orthogoriscus and to the basking shark), because it comes to the surface of the water in calm weather, Sea-pert, Carf, and Jerusalem Haddock.

Opal, a mineral which differs from quartz in containing generally 3 to 10—in some cases only 1, in others as much as 21—per cent. of water, its only other essential constituent being silica, although a little alumina, oxide of iron, &c. is often present. The water is readily driven off on the application of heat, and some opals contain so small a proportion of water that they might be described simply as jellyform quartz. Not infrequently minute scales or plates of tridymite (a crystallised variety of silica) are present in opal. The latter is never found crystallised, and does not exhibit a crystalline structure like quartz. It has a conchoidal fracture, and is very easily broken. There are many varieties, which pass into one another, so that their precise limits cannot be defined, from which has arisen no little confusion of names. The finest kind is called *Precious Opal* or *Noble Opal*, and sometimes *Oriental Opal*. It is semi-transparent or translucent, usually of a bluish or yellowish white colour, yellow by transmitted light, and exhibits a beautiful play of brilliant colours, owing to minute fissures which refract the light. It is much valued for setting in rings, brooches, &c., and is polished with a convex surface, never cut into facets, both because of its brittleness and because its play of colours is thus best exhibited. The ancients valued opals very highly. The Roman senator Nonius preferred exile to giving up an opal to Mark Antony. This opal was still to be seen in the days of Pliny, who ascribes to it a value equal to more than £100,000 sterling. The

imperial cabinet of Vienna contains the most celebrated opal now known to exist. It is 5 inches by 2½ inches. The finest opals are almost all brought from Cerwenitz, between Eperies and Kaschau, in Hungary, where they are found disseminated as alteration-products in trachyte tuff. They are mostly very small, but even a very small opal, if really beautiful, is worth four or five pounds; and the price increases very rapidly with increase of size. Precious opal is found also in Saxony, in South America, &c. When the colours are not equally diffused, but in detached spots, jewellers call it *Harlequin Opal*. There is a dark or blackish variety, apparently tinged by oxide of iron, which occasionally exhibits very beautiful reflections, and is then much prized. *Girasol* (q.v.) and *Cacholong* (q.v.) are varieties of opal. What lapidaries call *Prime d'Opal* is porphyrite or other igneous rock, containing many small amygdulæ of opal. It is cut into slabs, and made into boxes and other ornamental articles; the stone which contains the opals being often artificially blackened by boiling in oil, and afterwards exposing to a moderate heat. — *Common Opal* is semi-transparent, white, yellow, green, red, or brown, and does not exhibit any play of colours. It is not a rare mineral, and is chiefly found in veins and cavities or diffused (as an alteration-product) through the mass of various igneous rocks. *Semi-opal* is more opaque. *Wood Opal* is a petrification, and exhibits the form and structure of wood, the place of which has been taken by the siliceous mineral. *Hyalite* and *Menilite* are varieties of opal.

Opera (Ital. *Opera in Musica, Dramma per la Musica*) is a drama which is sung throughout to the accompaniment of a full orchestra. The various forms of aria or song, recitative or declamation, duet, trio, &c., concerted piece or instrumental interlude are used as the exigencies of the situation demand. The whole is usually introduced by an introduction, *vorspiel*, or Overture (q.v.), and often one of the acts contains a ballet or pantomimic dance. It is a direct development from the discovery by the Florence Academy (see MUSIC) of Monody or the musical expression of a single individuality by a single voice. As every country, every school since 1600 has felt the fascination of the art problem, and nearly every great composer has been ambitious to solve it, the opera is a universal possession, and its range is almost as wide and varied as the history of music itself. Three schools may be distinguished. *Italian Opera* is marked by its spontaneity and melodious character, and even more by the honour of priority; *German Opera* is the product of greater geniuses than the other two schools can boast, but lacks the continuity which makes the *French* school so interesting to the student.

Italian School.—The experiments in scena-writing (1582-90) culminated at Florence in the first real opera, *Dafne* (1594), by Peri and Caccini, the more successful *Euridice* (1600), and the very advanced work of Monteverde. The new departure in music soon spread its influence beyond Florence to Venice, where Monteverde spent the last thirty years of his life, and to Naples, where Alessandro Scarlatti (1659-1725) took up the work and founded the Neapolitan or 'beautiful' school. Scarlatti, by the prominence he gave to melody, may be said to be the founder of Italian opera, which to this day is noted for so-called melody in profusion, and the comparative indifference to other as important qualities, such as harmony, orchestration, and dramatic unity. No Italian work of the 18th century has survived save Cimarosa's *Il Matrimonio Segreto* (1792), which, very similar in style to Mozart's greater works, has been overshadowed by these. The most

famous modern Italian composer is Rossini, a brilliant vocal writer, whose charming *Barber of Seville* (1816) is a model of *opera buffa*, and whose serious opera, *William Tell* (1829), also keeps a place in the repertoire of the European stage. Bellini's *Norma*, *La Sonnambula*, *Puritani*, and Donizetti's *Lucia di Lammermoor* and *Lucrezia Borgia* still survive out of more than 100 melodious works. The earlier operas of Verdi are quite Italian in style (*Trovatore*, 1851; *Traviata*, 1853, &c.). *Aida* (1871) shows a leaning to, and *Otello* (1887) complete adhesion to the modern music drama. The veteran composer at the age of eighty-eight produced still another work, *Falstaff* (1891).

German Opera.—During the 17th and early part of the 18th century the opera in southern Germany was purely Italian. Dresden, where Hasse reigned supreme, and Vienna were the two centres. It was in Hamburg that the National school was founded by Keyser, who wrote (1694-1734) over 100 operas in which a high dramatic ideal is apparent. Gluck, though a German, belongs more to the school of French Grand Opera. Mozart, after beating the Italians on their own melodic ground in *Idomeneo*, *Die Entführung*, *Figaro*, and *Don Giovanni* (1781-87), wrote the first national romantic opera, *The Magic Flute* (1791). Beethoven, desiring nobler plots of a more serious and moral character than had satisfied the light-hearted Mozart, chose Bouilly's *Léonore* as the foundation of his single opera *Fidelio* (produced 1805, rewritten 1814). The operas of Weber were deeply imbued with the romanticism of the early 19th century, and in *Der Freischütz* (1821) he uses the national folklore with immense effect. To this new Romantic school also belong the operas of Marschner and of Spohr, the beauty of whose music is buried, like Weber's *Euryanthe* and Schubert's *Rosamunde*, under absurd libretti.

Melodrama in opera is an effective device which originated in Germany. The singer recites his part in an ordinary speaking voice accompanied by orchestral music, which seeks to convey the meaning of the situation and scene to the audience. Benda first used it (*Ariadne*, 1774), and Mozart, who heard it in 1778, was much impressed by its possibilities. The most successful example is the grave-digging scene in Beethoven's *Fidelio*; Weber in *Der Freischütz* and Mendelssohn in *A Midsummer Night's Dream* have also used it with happy effect.

The *French Grand Opera School* is extremely important, not only on account of its continuity and consistence, but because at various times, and for various reasons, great men were attracted from foreign countries to it as a centre. It was founded by the Florentine Lully, reformed by the German Gluck; and Italians like Cherubini, Spontini, Rossini, Belgians like Grétry, Germans like Meyerbeer and Wagner have both learned from it and contributed to its various stages of development. Lully (born 1633) arrived in Paris a boy of thirteen in the train of the Chevalier de Guise, and by his diplomatic and social, no less than by his musical talents, he gradually pushed his way to the very summit of musical success, and lived in great favour with King Louis XIV. In 1672 he obtained a patent conferring the sole right of producing operas in Paris, and this monopoly he held till his death in 1687. Musical Paris was sharply divided between his followers and those of Rameau (1683-1764), until the arrival of an Italian company made them unite their ranks in opposition to the foreigners. The characteristic of this French school from its beginning was its attention to rhetoric and dramatic requirements. The treatment of recitative in particular has always been a feature since Lully's time, and he it was also who invented the overture. Gluck arrived in Paris in

1774, and produced his *Iphigénie en Aulide* and *Iphigénie en Tauride* there; and the ideal expressed by Peri and Monteverde, embodied to a considerable extent in these and other works (see GLUCK), has at last found its goal in the music drama of Wagner. Cherubini's seriousness and nobility of style (*Les Deux Journées*, 1800), Méhul's fine ear for effect (*Joseph*, 1807), Spontini's magnificence of conception (*Vestale*, 1805), and Halévy's dramatic truth (*Juive*, 1835) were all ranged under Gluck's banner, and the roll of French grand opera is brought to a gorgeous close with the name of Wagner's predecessor, Meyerbeer (*Robert le Diable*, 1831, *Huguenots*, 1836, *Le Prophète*, 1843). The new blood he brought with him from the schools of Germany and Italy invigorated it, and the time was ripe when the experiment of *Rienzi* was made in 1842. Other important contributions to grand opera were Auber's *Masaniello* (or *Muette de Portici*, 1828) and Rossini's *Guillaume Tell* (1829).

Opéra Comique (by no means comic opera) is a title applied to all works which, on account of spoken dialogue, were not eligible for performance at the Grand Opéra. Grétry's *Cœur de Lion* (1784), Méhul's *Joseph*, Boieldieu's *La Dame Blanche* (1825), Hérold's *Pré aux Clercs* (1832), and Auber's *Le Maçon*, *Les Diamants de la Couronne*, &c. are the most famous. This *Opéra Comique*, so purely French, had a large share in the development of the modern lyric opera, of which Gounod's *Faust* (1859), Thomas's *Mignon* (1871), and Bizet's *Carmen* (1875) are good examples.

The *Ballet* (entirely pantomimic) attained a very high pitch of development in Paris, where Delibes (1836-91) produced his charming *Coppélia* and *Sylvia*.

Comic opera proper (*Opera Buffa*) is represented in Italy by Rossini's *Barbiere* and Donizetti's *Figlia del Reggimento* (1840); in Germany by Flotow's *Martha* (1847), Nicolai's *Merry Wives* (1849), and Lortzing's *Czar und Zimmermann* (1854); in France (*Opéra Bouffe*) by Offenbach's *Orphée aux Enfers* (1858), *Grande Duchesse* (1867), &c., Leococq's *Madame Angot* (1873), &c., and numberless other bright works; and in England worthily by the charming Gilbert-Sullivan series (*Pinafore*, 1878; *Patience*, 1881; *Mikado*, 1885).

Music Drama is the ideal which Wagner has sought to embody in *Tristan and Isolde* (1865), *Meistersinger* (1868), *Ring des Nibelungen* (1876), and *Parsifal* (1882). *Rienzi* (produced in Dresden in 1842) establishes his connection with the Grand Opera of Meyerbeer, and in the *Flying Dutchman* (1843), *Tannhäuser* (1845), and *Lohengrin* (1849) the growth of his method is distinctly seen, as well as his indebtedness to many predecessors, especially, in orchestration, to Berlioz. Wagner seeks to make the 'Art Work of the Future,' as he calls it, equally dependent on music, drama, and scenic art—the requirements of none being sacrificed to the demands of the other, but all contributing to one perfect unity. His influence is clearly traceable in all modern operas—e.g. Goldmark's *Queen of Sheba*, *Merlin*, Boito's *Meisiofele*, Ponchielli's *Gioconda*, Verdi's *Otello*, &c.

English Opera.—Purcell's early work, *Dido and Aeneas*, written at the age of seventeen, his chef d'œuvre *King Arthur* (1691), and other works gave promise of such an English school of opera as the 'Masques' of Laves and others had suggested (1613-75), but no one was ready to carry on the work after his early death in 1695 (aged thirty-seven). Dr Arne's *Artaxerxes* (1762), out of thirty-four operas, is the only other English opera which calls for mention. Italian opera became the fashion in London (Handel wrote forty-four, 1710-39), and England's attention has been divided between that school and the highly inæsthetic and, from an

operatic point of view, worthless form of *Ballad Opera*, founded by Dr Pepusch (*Beggar's Opera*, 1728), until recent years, when Dr Mackenzie's *Colomba* (1883), Villiers Stanford's *Canterbury Pilgrims* (1884), Goring Thomas's *Esmeralda* (1883) and *Nadeschda* (1885), and lastly Sullivan's *Ivanhoe* (1891) have sought to win recognition for England among the European schools of opera.—English opera was introduced into America in 1750, in the shape of the *Beggar's Opera*, and Italian opera in 1825.

See Hogarth, *Memoirs of the Opera* (1851); H. Sutherland Edwards, *Essays on Modern Opera* (1881); D. Hansliok, *Die Moderne Oper*, in three parts (1885); the articles in Grove's and other musical dictionaries on Opera, &c., and on GLUCK, MOZART, WEBER, WAGNER, &c. in this work.

Opera-glass (Fr. *Iorgnette*), a double telescope, used for looking at objects that require to be clearly seen rather than greatly magnified, such as adjoining scenery and buildings, the performers at a theatre or opera, &c. The opera-glass is short and light, and can be easily managed with one hand. Its small magnifying power (from two to three at the most), and the large amount of light admitted by the ample object-glass, enable it to present a bright and pleasant picture, so that the eye is not strained to make out details, as in telescopes of greater power, which generally show a highly-magnified but faint picture. It allows the use of both eyes, which gives to the spectator the double advantage, not possessed by single telescopes, of not requiring to keep one eye shut (a somewhat unnatural way of looking), and of seeing things stand out stereoscopically as in ordinary vision.

The opera-glass is the same in principle as the telescope invented by Galileo. It consists of two lenses, an object-lens and an eye-lens. The object-lens is convex, and the eye-lens concave. They are placed nearly at the distance of the difference of their focal lengths from one another (see TELESCOPE). The opera-glass need not be set to a precise point, as is necessary with ordinary terrestrial telescopes, for the lengthening or shortening of the instrument does not produce so decided an effect on the divergence of the light; the change of divergence caused by screwing the opera-glass out or in is so slight as not much to overstep the power of adjustment of the eye, so that an object does not lose all its distinctness at any point within the range of the instrument. There is, however, a particular length at which an object at a certain distance is most easily looked at. The two telescopes of the opera-glass are identical in construction, and are placed parallel to each other. The blending of the two images is easily effected by the eyes, as in ordinary vision. Opera-glasses have now come into such demand that they form an important article of manufacture, of which Paris is the great seat. So largely and cheaply are they produced in Paris that it has nearly a monopoly of the trade. They may be had from 2s. 6d. to £6 or £7. The cheapest opera-glasses consist of single lenses; those of the better class have compound achromatic lenses. A very ordinary construction for a medium price is to have an achromatic object-glass, consisting of two lenses, and a single eye-lens. In the finest class of opera-glasses, which are called *field-glasses*, both eye-lenses and object-lenses are achromatic. Plössl's celebrated field-glasses (Ger. *Feldstecher*) have twelve lenses, each object-lens and eye-lens being composed of three separate lenses.

Ophicleide (Gr. *ophis*, 'serpent,' and *kleis*, 'key'), a brass bass wind-instrument, was developed from improvements on the Serpent (q.v.) about the beginning of the 19th century. It consists of a conical tube having a bell like that of

the horn, a cup mouthpiece, and usually eleven holes stopped by keys like the old Kent bugle. It has the usual harmonic (see HARMONICS) open notes of all brass instruments, its fundamental, never used, being an octave lower. By means of its keys it has a range, including all the semitones, of a little over three octaves, and its music is written in the

bass clef. Alto and double-bass ophicleides have also been made, but not much used. It is much to be regretted that an instrument of such a characteristically rich tone, and capable of intonation so accurate as the ophicleide, should be allowed to fall completely out of use, it being almost superseded by the simpler three-valved instruments of the Sax-horn (q.v.) type.

Ophidia. See SERPENT.

Ophioglossæ, a sub-order of Filices or Ferns (q.v.), consisting of a few rather elegant little plants with an erect or pendulous stem, which has a cavity instead of pith, leaves with netted veins, and the spore-cases (*thece*) collected into a spike formed at the edges of an altered leaf, 2-valved, and without any trace of an elastic ring. They are found in warm and temperate countries, but abound most of all in the islands of tropical Asia. Several species are European, and two are British, the *Botrychium lunaria*, or Moonwort (q.v.), and the Common Adder's-tongue (*Ophioglossum vulgatum*), which was at one time supposed to possess magical virtues, and was also used as a vulnerary, although it seems to possess only a mucilaginous quality—on account of which some of the other species have been employed in broths. It is a very common plant in England, its abundance in some places much injuring pastures.

Adder's-tongue
(*Ophioglossum vulgatum*).

Ophir, a region, frequently mentioned in the Old Testament, from which the ships of Solomon, fitted out in the harbours of Edom, brought gold, precious stones, sandalwood, &c. The voyage occupied three years. Where Ophir was situated has been a much-disputed question. Arias Montanus fixed on Peru, Raleigh on the Moluccas, and Calmet on Armenia. Probably, however, Ophir was either on the east coast of Africa about Sofala, or in Arabia, or in India, but in which of the three countries is doubtful. Milton (following Purchas), Huet, Bruce ('the Abyssinian'), the historian Robertson, Quatremère,

Mauch, &c. are in favour of Africa; Michaelis, Niebuhr (the traveller), Gosellin, Vincent, Winer, Fürst, Knobel, Forster, Crawford, Kalisch, and Twistleton (Smith's *Dict. of the Bible*), of Arabia; Vitringa, Lassen, Ritter, Bertheau, Ewald, and Max-Müller, of India. Josephus, however, it should be said, placed Ophir in the peninsula of Malacca, and his opinion has been adopted by Tennent and Von Baer. For a complete discussion of the point, see Ritter's *Erdkunde* (vol. xiv.), eighty pages of which are devoted to Ophir. According to Ritter, who accepts Lassen's view, Ophir was situated at the mouth of the Indus.

Ophites (Gr. *ophitai*, from *ophis*, 'a serpent'), a class of Gnostics, who, while they shared the general belief in dualism, the conflict of matter and spirit, the emanations, and the Demiurgos, were distinguished by giving a prominent place in their systems to the serpent. Some of their divisions were the Sethiani, the Naaseni (Heb. *nahash*, 'serpent') in Phrygia, and the Peratæ, who honoured the serpent which tempted Eve, as having introduced knowledge and revolt against the bondage of the Archon. We owe our knowledge of them mainly to Irenæus, Clement, Origen, and Hippolytus: the last also contains an account of two other Ophite systems, that of the Sethians and of Justinus. Already in his day the sect was fast dying out, although Theodoret mentions serpent-worship as still existing in the 5th century.

See Gnostics, and the books named there; also Lipsius in the *Zeitschr. für Wissenschaftl. Theol.* (1863); Gruber, *Die Ophiten* (1864); and the Rabbi Dr Adolph Hönig's monograph, *Die Ophiten* (1889).

Ophitic Structure, name given by petrologists to a structure seen in various crystalline igneous rocks, in which large plates of a pyroxene are penetrated and divided, as it were, into small portions, by crystals of felspar. The separated portions of the pyroxene, however, are in crystalline continuity, since they all possess the same optic orientation.

Ophiuroidea. See BRITTLE-STARs.

Ophthalmia (derived from the Greek word *ophthalmos*, 'the eye') was originally and still is sometimes used to denote inflammation of the eye generally; but it is at the present time usually restricted to inflammations of the conjunctiva or mucons coat of the eye (*conjunctivitis*); and to two other diseases, *blepharitis tinea tarsi* or *ophthalmia tarsi*, and *sympathetic inflammation* or *ophthalmia* (see under EYE).

Ophthalmoscope, an instrument by which the interior of the eye can be examined. It was first invented in 1847 by Charles Babbage (q.v.); but, as unfortunately the ophthalmic surgeon to whom he showed it did not recognise its importance, he laid it aside without making it generally known; and its principle had to be rediscovered by Professor Helmholtz, to whom belongs the credit of bringing it before the medical and scientific world in 1851. The value of the instrument depends on the circumstance that by illuminating and examining an eye in the same direction its deeper parts can be rendered visible. All forms of ophthalmoscope are adaptations of this principle. The form now generally in use resembles more that of Babbage than that of Helmholtz. It consists of a concave mirror of about 10 inches focus, 1 to 3 inches in diameter, with a small hole in the centre, and certain lenses to use with it, the most important of them a separate convex lens of 2½ inches focus, and 1½ to 4 inches in diameter. Examination is facilitated by dilating the pupil of the observed eye with atropine; and for a complete examination this is often indispensable. The person whose eye is to be examined is seated in a darkened room, with a

bright light—e.g. a good gas-burner—on a level with his eye by the side of his head. The observer sits opposite him, and placing the mirror close to his own eye, and about 18 inches from the eye to be examined, reflects the light upon the latter, while he looks at it through the hole. The pupil in a healthy eye appears of a bright red or orange instead of its usual deep black. In short-sighted and long-sighted eyes, but not in normal ones, the vessels of the retina, the entrance of the optic nerve, &c. can be more or less distinctly seen, and by their movements the deviation from the normal refraction can roughly be estimated. Opacities in the lens (Cataract, q.v.) or vitreous humour appear black, and are discovered by this method more certainly and easily than by any other. The details of the retina, choroid, &c. (or *fundus*) can be seen in two different ways. In the *indirect method* the observer, seated as above described, holds the 2½-inch convex lens about 3 inches from the eye under examination, between it and his own, when a clear real image of part of the fundus, inverted and magnified about four diameters, appears in the red light of the pupil. In the *direct method* the observing eye must be placed as close to the observed as the intervention of the mirror will allow, when a virtual image of a smaller part of the fundus is seen, but erect and magnified about fourteen diameters. The fundus appears of an orange or red colour, varying much in different individuals; the blood-vessels of the retina are seen as darker red lines coursing over it. The entrance of the optic nerve, commonly called the *disc*, from which these vessels diverge, appears as a round area of a much paler colour. The ophthalmoscope has revolutionised this department of medicine, as most of the deeper affections of the eye, particularly of the optic nerve, choroid, and retina, were before only recognisable after the eyeball was removed from the body. Some of these affections have, moreover, important relations to general diseases—e.g. Bright's disease, diabetes, syphilis, diseases of the brain and spinal cord—and general medicine has benefited accordingly. The ophthalmoscope has also much facilitated the discovery and correction of errors of refraction (short- and long-sightedness, Astigmatism, q.v.; and see under EYE).

Opie, JOHN, R.A., was born at the village of St Agnes, 7 miles from Truro, Cornwall, in May 1781. His father, a master-carpenter, wished him to follow the same trade, but his bias for art was strong; and his attempts at portrait-painting secured the friendly help of Dr Wolcot ('Peter Pindar'). In 1780 he was taken to London by Dr Wolcot, and immediately came to be acknowledged by the fashionable world as the 'Cornish Wonder.' This tide of good-fortune soon ebbed, but not before Opie had realised a moderate competency. The loss of popular favour, however, only served to bring out Opie's manly independence and strong love of art, and he calmly entered on that department of painting which was then regarded as the only style of high art, namely, historical or scriptural subjects, executed on a large scale. His pencil was employed by Boydell in his well-meant and magnificent scheme to elevate British art; he also painted a number of works in the illustration of Bowyer's *English History*, Macklin's *Poets and Biblical Gallery*, and other similar undertakings. His pictures of the 'Murder of James I. of Scotland,' 'The Slaughter of Rizzio,' 'Jephtha's Vow,' 'Presentation in the Temple,' 'Arthur and Hubert,' 'Belisarius,' and 'Juliet in the Garden' are his most noted works. Opie was elected an Associate of the Royal Academy in 1786, and Academician in the following year. He wrote the 'Life of Reynolds' in Dr Wolcot's edition of Pilkington's *Dictionary of Painters*, and

An Inquiry into the Requisite Cultivation of the Fine Arts in Britain; and delivered lectures on Art at the Royal Institution. Opie was twice married. He obtained a divorce from his first wife; his second was the novelist. He died April 9, 1807, and was buried in the crypt of St Paul's, near the grave of Reynolds.—MRS OPIE, the daughter of a Norwich physician, Dr Alderson, was born in 1769, and while very young wrote songs and tragedies, and was acquainted with Godwin, Mrs Inchbald, Mrs Siddons, and much of the literary society of the time. She was married to Opie in 1798. In 1801 her first novel, *Father and Daughter*, appeared; the following year, a volume of poems. *Adeline Mowbray* and *Simple Tales* were her next works. On her husband's death she returned to Norwich, and published his lectures with a memoir prefixed. She wrote also *Temper*, *Tales of Real Life*, *Valentine's Eve*, *Tales of the Heart*, and *Madeline*. Having been long acquainted with the Gurneys, Mrs Opie became a Quaker in 1825, and afterwards published *Illustrations in Lying*, *Detraction Displayed*, and articles in periodicals, but no more novels. She died at Norwich, 2d December 1853. See her *Memoirs* by Miss Brightwell (1854), and Miss Thackeray's *Book of Sibyls* (1883).

Opitz, MARTIN, German poet, born on 23d December 1597, at Banzlau on the Bober, in Silesia, who for a century or more after his death was extravagantly praised as the 'Swan of Bober,' the 'Swan of Silesia,' the 'Father and Regenerator of German poetry.' This inflated reputation he had earned by toadying to the princes of Germany, by writing adulatory poems in their honour, by praising third and fourth rate poetasters, who recompensed him in kind. Although himself a Protestant, he worked and wrote for one Count Hannibal von Dohna, a cruel persecutor of the Protestants; but then Count Dohna helped him to get (1628) from the emperor a patent of nobility, and Ferdinand II. had with his imperial hand previously (1625) crowned him with the laurel crown of the poet—recognitions of his talent that Opitz valued above all things. He was summoned (1622) by Bethlen Gabor, Prince of Transylvania, to fill the chair of Philosophy and Polite Literature at Weissenburg; but at the year's end was so homesick, so wearied of the rude, martial people, and so famished through lack of the kind words of his friends, that he returned to Germany. Then he curried favour successively with the Duke of Liegnitz (1624), Count von Dohna (1626), and King Ladislaus IV. of Poland (1634), who made him his secretary and historiographer of Poland. But fate was against him: in 1620 he had fled from Heidelberg to Holland to escape war and the plague; now in Danzig, where he was living, he caught the plague from a beggar, to whom he gave a coin in the street, and died 20th August 1639. The poems Opitz wrote are like his ordering of his life, calculated: they owe their origin to the understanding, have no imagination, and little feeling, and are cold, formal, pedantic. The fact is, Opitz, originally a schoolmaster, schoolmastered poetry into lifeless imitation of pseudo-classic models. Poetry must, he propounded, in his most original work, *Buch von der deutschen Poeterei* (1624; new ed. 1876), teach and instruct as well as please. Hence his favourite pieces are purely didactic—*Trostgedicht in Widerwärtigkeit des Kriegs*, *Zlatna oder von der Ruhe des Gemüths*, *Vielgut oder vom wahren Glück*, *Venustus*, and others—such as the 'good boy' writes who wishes to please a pedantic master. Yet Opitz is entitled to the credit of having championed the use of his mother-tongue as against Latin, and of having actually used it. He also insisted upon the difference between the

ancient prosody of feet and quantity and the modern prosody of accent and rhyme, emphasising the use of the last for German poetry, and recommending the Alexandrine form of verse as that best suited to the genius of his native tongue. His works include translations from classic authors (Sophocles and Seneca, whom he puts on exactly the same rank as dramatists), the Dutchmen Heinsius and Grotius (whom he sets up as models of style), and from the Bible. Through the men who swore by him—the so-called first Silesian school—Opitz reigned for nearly a century as a sort of posthumous literary dictator, a worthy rival of Gottsched.

The best editions of his *Gesammelte Schriften* are those that appeared in his lifetime (1637, 1641). See *Lives* by Strehlke (1856), Weinhold (1862), and Palm (1862), and critical works on the *Buch der Poeterei* by Borinski (1883), Fritsch (1884), and Berghöffer (1888).

Opium, one of the most valuable of medicines, is the dried juice of the unripe capsules of a species of Poppy (q.v.), *Papaver somniferum*, of which several varieties are cultivated, the most usual in India, Persia, and China being apparently the variety *album*. The cultivation of the poppy for the sake of opium is carried on in many parts of India, although the chief district is a large tract on the Ganges, about 600 miles in length and 200 miles in breadth, which is divided into two *agencies*, that of Behar and that of Benares, the central factory of the former being at Patna, and that of the latter at Ghazipur. The poppy is also extensively cultivated for opium in the Asiatic provinces of Turkey, in Egypt, in Persia, and in China; and opium of fair quality is produced, although not to any considerable amount, in some parts of Europe, and even in Britain.

The poppy requires for its profitable cultivation a rich soil, and in India is generally sown in the neighbourhood of villages where manure can be easily obtained. The soil ought to be fine and loose when the seed is sown. The subsequent cultivation consists chiefly in thinning and weeding. Irrigation is practised. Mild moist weather, with night-dews, is deemed most favourable during the time of the collection of the opium. Very dry weather diminishes the flow of the juice, and much rain is injurious. The opium poppy is cultivated for its seed or oil and other purposes besides the production of opium, concerning which see POPPY.

Opium, as a commercial article, is of great importance, exceeding indeed that of any other drug in use. The cultivation of the opium poppy in British India forms a most extensive branch of agriculture, and the collection and preparation of the drug itself employs a large number of persons. The seed is sown in India in the beginning of November; it flowers in the end of

Fig. 1.

January, or a little later; and in three or four weeks after the capsules or poppy-heads are about the size of hens' eggs, and are ready for operating upon. When this is the case the collectors each take a little instrument (fig. 1), made of four small knives tied together, the blades appearing like the teeth of a comb; with these instruments they wound each half-ripe poppy-head (fig. 2) as they make their way through the plants in the field. This is always done in the afternoon, and on the following morning the milky sap is collected by scraping it off with a kind of scoop, and transferred to an earthen vessel hanging at the side

of the collector. When this is full it is carried home and placed in a shallow open brass dish, and left for a time tilted on its side, so that any watery fluid may drain out; this watery fluid is very detrimental to the opium unless removed. It now requires daily attention, and has to be turned frequently, so that the air may dry it equally, until it acquires a tolerable consistency, which takes three or four weeks; it is then packed in small earthen jars, and taken to the factories, where the contents of each jar are turned out and carefully weighed, tested, valued, and credited to the cultivator. The opium is then thrown into vast vats, which hold the accumulations of entire districts, and the mass being kneaded is again taken out and made into balls or cakes for the market. After being fully dried these balls are packed in chests for the market. Of the Indian opium there are several qualities, as Patna, Benares, Malwa, &c. The area under cultivation in India with the poppy varies from year to year; in some years the area in Bengal alone has been as high as 560,000 acres. Certain districts are permitted to cultivate the plant, but the cultivators must obtain a license. Government purchases the opium at about 10s. a seer of 2 lb., and an acre yields from 10 to 15 seers of opium over and above the petals, capsules, and seed.

Fig. 2.

In Persia the drug is prepared at Ispahan, Shiraz, and Yeze; the latter is considered the best. The morphia in Persian opium is only 2 to 8 per cent., against 7 to 11 per cent. in Turkish opium. In Khorassan the cultivation of the poppy increased tenfold between 1875 and 1890. A quantity of opium for local consumption is prepared in the shape of sticks or cylinders. That destined for China is mixed with linseed-oil in the proportion of 6 or 7 lbs. to each chest; but that sent to London is pure. The exports of Persian opium, which in 1874 and 1875 were only 2000 chests, rose before 1890 to 7700 chests. In Turkey the production is also large.

For the relation of the opium trade to the revenue of British India, see INDIA, Vol. VI. p. 115. There has been a good deal of controversial discussion carried on of late years as to the effects of opium-smoking (see below), and the abolition of the Indian trade is by many earnestly demanded. Those who support the present fiscal system of India say it is on the whole better that the preparation and sale of Indian opium should be in the hands of the government as a monopoly, for if abandoned by them its culture and manufacture would be carried on in many other localities favourable to the growth of the poppy. Indeed its culture has been already tried in Australia, Africa, and parts of America. It should also be remembered that China itself produces opium largely; there is virtual permission and open connivance of all the local authorities at the culture of the poppy over the length and breadth of the empire. Professedly forbidden, its culture is free to all. The local production of opium is indeed believed to be as large as the foreign import, since the authorities prefer to quietly encourage the home-grown produce, so as to prevent the export of bullion for the foreign. In south-western China the production of opium is stated to exceed 280,000 cwt., and it sells at two-thirds the price of the Indian.

In 1880 the annual revenue from opium in India was nearly £10,500,000, of which the excise opium (or that locally consumed) yielded £1,000,000, and the 'provision' or export opium the rest. But the net revenue has declined by over £2,500,000. About 40,000 chests (of 140 lb.) are produced in the native states of Central India, Rajputana, and Baroda, which pay a transit duty for export from Bombay. The following figures (in cwts.) show the decline in the export, and the countries to which the Indian opium goes.

	1880.	1889.
Hong-kong.....	83,055	76,493
Treaty Ports.....	46,046	19,997
Cochin-China.....		1,541
Straits Settlements.....	15,417	20,184
Other Countries.....	120	383
Total.....	144,638	118,598

In 1860 the chest of Indian opium fetched £185; but it gradually dropped to £111, although rather better prices were obtained in 1889. It is sold monthly by public auction at Calcutta. To prevent speculation and to steady prices, the quantity to be sold during the year is duly notified in the previous year. The bulk of the Indian opium, it will be seen, still finds its way to China. Persian opium, like the Chinese, has increased greatly in recent years, and, being cheaper than the Indian article, has begun to have a distinct effect upon the market. The foreign exports from India by no means represent the total trade in the drug. There is an immense internal consumption of what is known as 'excise opium,' averaging about 4500 chests yearly. This is retailed to the Indian consumer as a decoction, or in the form of two smoking mixtures, *chandu* and *madak*.

The quantity of the different kinds of opium imported into China (added to the stock held in bond from the previous year) was in 1889 as follows, in piculs of about $1\frac{1}{4}$ cwt. each.

Malwa.....	36,200
Patna.....	26,165
Benares.....	18,177
Persian.....	3,414
Turkey.....	2,414
Total.....	86,370 = 108,000 cwt.

The net imports into China were, in 1888, 82,612 piculs, and in 1889, 76,052 piculs. The likin or local duty and the import duty amount to 110 taels per chest, or about £26. From 1830 to 1840 the imports of foreign opium into China amounted to 20,619 piculs; from 1840 to 1850 they increased to 52,925 piculs. In 1860, when the trade was legalised, the imports reached 89,744; in 1870, 95,043; in 1880, 96,839; and in 1889 they fell to 76,040 piculs. The imports of opium into Great Britain average 600,000 to 700,000 lb. annually. This is chiefly re-exported—about 140,000 lb. to the United States, and over 200,000 lb. to South America and the West Indies. The United States imports nearly 600,000 lb. of crude opium, and from 45,000 to 75,000 lb. of opium prepared for smoking.

In Europe opium is mainly used for medicinal purposes, and large quantities of it undergo further manufacture, in order to separate from it the active principles morphine, narcotine, &c. In Great Britain the chief manufacture of these salts of opium is carried on in Edinburgh, where two firms manufacture these products upon an immense scale, supplying probably a fifth of the whole quantity manufactured.

Chemical Properties, &c.—All kinds of opium have a bitter, nauseous taste, and a peculiar narcotic, heavy odour. Chemically it is a gum-resin containing a very large number of alkaloids, meconic and other acids, and the ordinary constituents of a plant juice. Its exact composi-

tion varies greatly, but is somewhat as follows: **Alkaloids**—morphine (4-15 per cent.), narcotine (4-6 per cent.), thebaine, codeine, narceine, papaverine (of each from about $\frac{1}{4}$ -1 per cent.), cryptopine, rhœadine, laudanine, laudanoline, pseudomorphine, codamine, meconine, protopine, lanthopine, papaveramine, oxynarcotine, hydrocotarnine, gnoscopine, tritopine, and others, all in very small amount. They exist free or in combination with meconic, lactic, sulphuric, and phosphoric acids. There is about 8 per cent. of saccharine matter, about 35 per cent. of gum, resin, fat, albumen, &c., various inorganic bases, and a variable amount of water. It may be adulterated with sugar, gum, or molasses, and sometimes contains nails, lead, or stones in the centre of the mass.

The chief and most easily applied chemical test for opium depends on the presence of meconic acid, which is an organic acid peculiar to it. A watery or alcoholic solution turns blood-red in colour on the addition of a solution of perchloride of iron, and this colour is discharged by a solution of protochloride of tin. Its smell and taste are also very characteristic. Turkey opium is generally considered the best, and in the British Pharmacopœia it alone is directed to be used for making the official pharmaceutical preparations (twenty in number). Before use it must be dried and powdered, and standardised to a strength of as nearly as possible 10 per cent. of morphine. For making the official alkaloids any kind of opium may be used. A method of assaying the amount of morphine in it is given with great detail in the British Pharmacopœia.

Action and Medicinal Uses.—The action of opium depends on its alkaloids, and is chiefly determined by the morphine present in it. Ordinary medicinal doses ($\frac{1}{2}$ to 3 grains) depress the activity of the brain and cause deep sleep with contracted pupils, slow respiration, and insensibility to pain. On awakening there are usually disagreeable after-effects, such as loss of appetite, slight nausea, constipation, mental fatigue, and headache. When minute doses are taken there ensue symptoms of excitement and stimulation, as shown by increased mental and bodily activity, restlessness and sleeplessness. The imagination is more active, and mental work can be accomplished with greater ease and celerity. It is disputed whether these effects are due to actual stimulation of the brain, or whether the higher centres are blunted, and thus allow the imaginative faculties to have fuller play. Most probably the latter is the case. Self-consciousness and self-criticism are lulled, the judgment is less controlled by the higher centres and by impressions from without, and left to itself part of the brain lapses into uncontrolled activity. It is for these reasons that opium is habitually used by some brain-workers. Individual susceptibility and race influence its effects very largely. The Teutonic races and phlegmatic people in general tend to sleep after it, while Easterns and persons of highly nervous temperament tend to become excited. Man, owing to the greater development of his brain, is somewhat differently affected from the lower animals. Frogs, after a primary stage of narcosis, pass into a condition of exquisite tetanic spasm from stimulation of the spinal cord, and the lower mammalia exhibit the same condition to a lesser degree. In adult man tetanic convulsions are rarely seen, and only occasionally after enormous doses; but in children convulsions are not infrequent, the explanation given being that in them the spinal cord is relatively largely developed in proportion to the brain. Opium diminishes all the secretions except the sweat, and thus causes constipation. It does not materially affect the heart or circulation in medicinal doses.

When opium is used habitually a tolerance for it becomes established, and enormous doses may be taken without any special effects. In medicine it is used chiefly to procure sleep and relieve pain. For these purposes it has no equal. It is also employed to arrest secretions, to allay irritation, and in diarrhoea. In diabetes, heart disease, hæmoptysis, and many other conditions it is given with great advantage. Probably no remedy has such wide and universal applications.

It must be given with great caution to young children, but many other factors, such as pain, habit, idiosyncrasy, and various diseases influence its action and dosage.

Poisoning.—About half the deaths from poison which occur in the United Kingdom are due to opium or its preparations. When the effects of a large dose become fully developed the person lies in deep coma and in a state of complete insensibility. Respiration is slow, noisy, and stertorous, the pupil is contracted to a 'pin-point,' and insensible to light, the pulse is rapid and weak, or sometimes full and slow, the face and skin generally are pale and livid, and covered with cold perspiration. Constant stimulation may rouse the patient partially, but he always tends to relapse into stupor. Death is due to paralysis of the respiratory centres in the brain, but may be due to apoplexy or collapse. Such are the usual symptoms, but many cases present peculiar features, such as convulsions, vomiting, diarrhoea, delirium, dilated pupils, and other anomalous symptoms. The *post-mortem* appearances are not characteristic, but the cerebral blood-vessels are usually very full, and there may be effusion of serum into the ventricles. The smallest fatal dose recorded for an adult is four grains, but enormous quantities are often taken without serious symptoms. In infants very minute doses ($\frac{1}{4}$ to $\frac{1}{2}$ grain) may prove fatal. Death may occur in about two hours or even less; few cases are prolonged beyond twenty-four hours.

The treatment consists in making the patient vomit, and in washing out the stomach with large quantities of water. Owing to the state of insensibility emetics sometimes fail to act. Atropine is often given subcutaneously, while coffee or tea or caffeine may be also freely given. The patient may be further aroused by keeping him moving about supported by attendants, by cold cloths applied to the chest, and by electric stimulation. Any violence or measures which tend to exhaust the patient should be carefully avoided.

Opium-eating.—The habitual consumption of opium or any of its preparations by persons otherwise in good health is known as opium-eating, the opium habit, morphine habit, or morphinism. Opium, laudanum, chlorodyne, black drop, nepenthe, morphine, and other forms are all used. They are most commonly taken by the mouth, the subcutaneous injection of Morphine (q.v.) being almost entirely confined to the more cultured and educated classes. Its habitual use is usually begun to relieve pain or sleeplessness, and one month's constant use is said to be sufficient in many cases to confirm the habit. The amount consumed by different individuals varies greatly. Of morphine most habitués take about three grains daily, some five or six grains, while a few go much higher. De Quincey says that at one time of his life he consumed 8000 drops of laudanum daily, but his ration was very excessive. The immediate effects are a feeling of stimulation and well-being, but as soon as these have passed off there ensues a state of despondency, to banish which a fresh dose is taken. It is a craving brought on by indulgence, and is to be ranked with such habits as drinking, smoking, gambling, &c. Many persons indulge this craving during their whole life, and do their daily

work well. Such persons do not, however, go to any great excess, although they may have the craving as markedly as others who suffer intensely from well-developed symptoms of chronic opium poisoning. The typical opium-eater is lean and pale, with dull, glazy eyes; he suffers from chronic dyspepsia, from nervous irritability, and disturbances of the circulation. Albuminuria, glycosuria, and various other disorders are sometimes present. Sudden deprivation causes severe nervous disturbances and not seldom alarming collapse. For successful treatment of the opium craving the patient had better be removed from his own home and friends to some institution where he can be under strict and constant medical supervision. There is a difference of opinion as to whether the opium should be abruptly or gradually withdrawn. Recovery is generally complete in a few weeks, but relapses into the habit are exceedingly apt to occur.

Opium-smoking.—The smoking of opium as a stimulant-narcotic is practised chiefly in China, India, Borneo, and the far East. In China probably about 1 per cent. of the entire population smoke opium, but the habit is growing rapidly. In 1767 only about 200 chests of opium were imported yearly, while in 1854, 78,000 chests were needed. Fines, penalties, and even death have been found ineffective to stop the practice. Opium prepared for smoking is called *chandu*, which is simply a watery extract, about twice the strength of the original drug. A special form of pipe is used, a piece of prepared opium about the size of a pea is placed, by means of a small flattened iron pen, into a small cup at one end; this is ignited and the smoke inhaled, and then slowly exhaled through the nostrils. As a result, Easterns experience mental and physical excitement, followed by a pleasant sense of well-being and content, and then narcosis. Europeans, as a rule, are not affected by it to any appreciable extent. In the pipe the opium is destructively distilled, and chiefly the products of destructive distillation come over in the smoke—pyridine, collidine, and similar bases. There is probably scarcely a trace of morphine. The flavour of the smoke is mild and aromatic. In China and Singapore there are public smoking-houses, but it is also largely practised in private. It is reported that there are a million opium-smokers in the United States, especially in San Francisco and New York.

There is great difference of opinion regarding the hurtfulness of the habit. Some authorities hold that in moderation it is not more hurtful than tobacco, while missionaries and others maintain that the habit is fraught with moral, social, and individual degradation. This seems to depend largely on the extent to which it is carried, and the question is probably on all fours with that of alcohol in this country. Many Chinese smoke opium all their lives in strict moderation without apparent harm, while others have excessive debauches lasting a week or more, and often become confirmed in its excessive use. The latter without doubt wreck their constitutions and suffer in much the same way as confirmed alcoholics do.

See the articles LAUDANUM, MORPHINE, POISONS; the medical works on stimulants and narcotics. As to the harmfulness of the use of opium, see Calkin, *Opium and the Opium Appetite* (Phila. 1870); H. H. Kane, *Opium-smoking in America and China: a Study of its Prevalence and Effects* (New York, 1882); the publications of the Society for the Suppression of the Opium Trade (founded 1874); W. J. Moore, *The Other Side of the Opium Question*, and W. H. Brereton, *The Truth about Opium* (both published in 1882, in defence of the opium trade); Vignet, *Étude sur L'Opium* (Paris, 1875); Wiselius, *De Opium in Nederlandach en Britisch Indië* (Hague, 1856). For the Opium Wars, see CHINA, Vol. III. p. 192.

Opodelloc is a popular synonym for soap *Liniment* (q.v.). The origin of the term, which was apparently applied by Paracelsus to various forms of liniments or local applications, is not known. The *opo* is the same as the *opo* of *opopanax*, *opobalsamum*, &c., and is doubtless derived from the Greek *opos*, 'juice.' See *Notes and Queries*, October 1888, p. 316.

Opo'panax, a gum-resin obtained in Persia, which comes to Europe at rare intervals. It has an unpleasant odour resembling bruised ivy leaves. Holmes suggests that it may be the produce of some Araliaceous plant, but nothing is known of its botanical origin. The ancient physicians attached great importance to it as an antispasmodic medicine; Hippocrates, Theophrastus, and Dioscorides have each left descriptions of it. The plant *Opopanax chironium*, from which it was supposed to be obtained, grows generally throughout southern Europe. The perfume known as *opopanax* is not derived from this gum-resin. There is a commercial *opopanax*, a kind of perfumed myrrh, obtained from a *Balsamodendron*, largely imported into Germany, where an essential oil is distilled from it.

Oporto (Port. *O porto*, 'the port'), the second city of Portugal, stands on the steep, rocky, right bank of the Douro, high above its waters, which reach the sea 3 miles to the west. 'The houses, as they rise confusedly from the river's edge, some painted in strong reds, blues, or greens, some left whitewashed, and the majority retaining the granite gray of the stone they are built with, make up a very strange and beautiful panorama, ringed as the city is by the encircling pine-covered mountains' (Oswald Crawford); and many of these houses stand embowered in the greenery of gardens. One of the crags overlooking the river is crowned with a Crystal Palace (1865), surrounded by gardens. Many of the former monasteries are still standing, though put to other uses: one is a citadel, another the exchange, with splendid marquetry of wood in floor and walls, a third barracks, and so on. There are seven principal churches, including the cathedral (built by Henry the Navigator), the old Gothic church of Cedofeita (originally founded in 559), and the Church dos Clerigos, with a tower 213 feet high. The English factory (1785), the bishop's palace, and the hospital of St Antony are the most noticeable amongst the secular buildings. Oporto possesses a polytechnic academy, with observatory, scientific collections, &c., a medical school, a fine art academy, a commercial museum, an industrial institution, a library (1796) of 200,000 vols. and 9400 MSS., and two picture-galleries. On the south side of the river, immediately opposite Oporto, and connected with it by a lofty bridge, is the suburb of Villa Nova de Gaia, with a pop. of 9126, and extensive wine-cellar. The railway to Lisbon (209 miles) crosses the river a little higher up, on one of the finest (steel) arch bridges built; the arch spans a horizontal distance of 549 feet, and its centre is 203 feet above the river. The pop. of Oporto was (1878) 105,838. They are chiefly engaged in the manufacture of cloth and silks, hats, porcelain, ribbons, tobacco, soap, and candles, in metal-casting, tanning, brewing, distilling, cork-cutting, sugar-refining, and brick-making, and in commerce and shipping. Oporto is the principal place of export for Port Wine (q.v., and also PORTUGAL). The remaining exports of moment are cattle, oranges and other fruits, cork, copper, onions, meat, hides, and wool, the total value of all exports reaching on an average £3,550,000. The imports, consisting chiefly of corn and flour, cod-fish, metals, machinery, textiles, rice, raw sugar.

hides, coal, and timber, amount to £1,800,000 annually.

Originally the *Portus Cale* of the Romans (whence Portugal), this city was the stronghold of the Christians in the north-west of the Iberian peninsula against the attacks of the Moors, and more than once changed hands between the 8th and the 12th centuries. The people are noted for their sturdy patriotism and liberal sentiments; in 1808 they were especially hostile to the French; they stoutly opposed the usurper Miguel (1828), who in revenge executed great numbers of its people, but without breaking their spirit, for they supported Pedro of Brazil, and withstood the besieging troops of Miguel thirteen months (1832-33). It was the scene of frequent republican riots in the 19th century. See O. Crawford in *New Review* (1889).

Opossum (*Didelphys*), a genus of Marsupialia, having ten incisors in the upper jaw, and eight in the lower, one canine tooth on each side in each jaw, three compressed premolars, and four sharply-tuberculated molars on each side—fifty teeth in all; the tail generally very long, prehensile, and

Virginian Opossum (*Didelphys virginiana*).

in part scaly; the feet plantigrade; five toes on each foot, their claws long and sharp; but the inner toe of the right foot converted into a thumb, destitute of a claw, and opposable to the other digits. The pouch, so characteristic of marsupials, is generally absent, sometimes rudimentary, rarely complete. The unwebbed feet and non-aquatic habits distinguish this genus from *Cheironectes* (q.v.), also belonging to the family Didelphidae. The name opossum has also been applied to certain Australian forms, but is better restricted to the American opossums, which are the only marsupials found in America. They range from the United States to the Argentine Republic. There are altogether twenty-three distinct species, with a considerable range in size, varying from that of a large cat to that of a mouse. The best known is the Virginian Opossum (*D. virginiana*). Among the marsupials they are nearest allied to the *Dasyuridae*, from which they are doubtfully separable; if it were not for their geographical range, they would undoubtedly be placed in the same family. Although there are now no opossums found anywhere but in America, they existed formerly in Europe, as is shown by their fossil remains. The opossums are all carnivorous, one species, the Crab-eating Opossum, feeding—as its name denotes—upon crabs; in order to capture its prey it frequents marshy places. It is a native of tropical America. Merian's Opossum (*D. dorsigerus*) is remarkable for the fact that it carries its young on its back, their tails being twined round the tail of the mother; many other species carry the young on the back; this is due in many cases to the fact already mentioned—that

there is no pouch. The Virginian Opossum is a foe to poultry-yards in the United States; but it can put up with frogs if there is nothing better to be had. The opossums, like other marsupials, have a lowly organised brain; but they are remarkably cunning in robbing poultry-yards; on the other hand, their stupidity in walking straight into the simplest and most obvious trap is more in accord with their brain structure. Hunting the opossum with dogs by night is a favourite sport in the southern states, especially in autumn, when the body has a thick layer of fat all over. The animal takes refuge in a tree, and is either shaken down or shot as it hangs by the tail. The expression 'playing possum' refers to the opossum's habit of feigning death when caught. At such times, though usually very timid, it will endure almost any amount of torture, and give no sign of its suffering.

Opoteca, a sleepy town of 1000 inhabitants, in Honduras, about 15 miles NNW. of Comayagua, formerly famous for its great silver-mines.

Oppeln, a town of Prussian Silesia, on the Oder, 51 miles SE. of Breslau. Since 1816, when it was erected into a seat of government for Upper Silesia, the town has been much beautified both with new edifices and with parks and gardens. Its church of St Adalbert was founded in 995; and there is an old castle on an island in the Oder. The manufactures include pottery, cigars, cement, beer, leather, &c., and there is a considerable trade in grain and cattle. Pop. (1875) 12,498; (1885) 15,975. See Idzikowski's *Geschichte der Stadt Oppeln* (1863).

Oppenheim, a town of Hesse-Darmstadt, on the left bank of the Rhine, 20 miles SSE. of Mainz by rail, with fine vineyards. On the site of the Roman castle of *Bauconica*, Oppenheim became a free city of the empire, and was repeatedly besieged, especially in the Thirty Years' War. Pop. 3452.

Opportunists, in French politics, are those who, like Gambetta, Ferry, and others like-minded, oppose doctrinaire as well as extreme views, accommodate themselves in great measure to the circumstances of the hour, and aim only at what can obviously be carried through.

Optical Illusion. An object appears large or small, near or distant, according as the rays from its opposite borders meeting at the eye form a large or a small angle: when the angle is large, the object is either large or near; when small, the object must be small or distant. Experience alone enables us to decide whether an object of large apparent size is so on account of its real size, or of its proximity; and our decision is arrived at by a comparison of the object *in position* with other common objects, such as trees, houses, &c., which may chance to be near it, and of which we have by experience come to form a correct idea. The same is, of course, true of apparently small objects. But when all means for comparison are removed our judgment is at fault. Similarly, we erroneously infer spherical solids at a distance to be flat discs; and, by reason of Irradiation (q.v.) in the eye, the sun appears larger than he would if illumined by a fainter light, and a man in a white habit seems larger than he would if he wore a dark dress. Illusions are also produced by external causes; and instances of this sort are given under **MIRAGE**, **REFLECTION**, and **REFRACTION**.

The persistence of impressions on the retina for about one-sixth of a second after the object which produced the impression has been removed produces another class of illusions. Common examples of this are the illumined circle formed by the rapid revolution of an ignited carbon point, piece of red-hot iron, or other luminous body, and the fiery

curve produced by a red-hot shot projected from a cannon.

Another form of illusion is produced to a person who is seated in a vehicle in motion; and it is very deceptive when the motion is so equable as not to be felt by the person himself. The illusion is most complete when the attention is riveted on an object several yards off; this object then appears to be a centre round which all the other objects revolve, those between the observer and the object moving backwards, and those beyond the object moving forwards. This illusion occurs on a large scale in the apparent motion of the heavenly bodies. Other illusions arise from a disordered state of the organs of vision: e.g. the seeing of things double or movable, or of a colour different from the true one (see **COLOUR-BLINDNESS**); the appearance as of insects crawling over a body at which the eye is directed, &c.

Optic Nerve. See **EYE**.

Optics is the science of the phenomena of light. This science is usually treated under two heads: (1) Physical Optics, which treats of the nature of Light (q.v., as also **MAGNETISM** and **UNDULATORY THEORY**), and explains the phenomena of Colour, Reflection, Refraction, Interference and its consequences, such as the colours of thin plates and films, Diffraction, Dispersion, the Spectrum, Polarisation and the properties of polarised light, for which see separate articles; and (2) Geometrical or Mathematical Optics. The leading idea in physical optics is to trace the progress of an undulatory or oscillatory disturbance in the Ether (q.v.); this disturbance, which may be termed a wave, has an advancing wave-front; the direction along which this wave-front advances through a given point is a geometrical conception, which it is convenient to make use of in diagrams, more convenient than it would be to draw a series of successive wave-fronts; this direction of propagation through any given point is called a ray; and geometrical optics traces, by mathematical reasoning, the course of a given set of 'rays' under specified conditions, particularly under those which have reference to Reflection and Refraction (q.v.). The part of geometrical optics which deals with reflection of light is often called Catoptrics (based on such laws as that the angle of reflection is equal to the angle of incidence); that which deals with refraction is called Dioptrics: and for an account of these, reference is made to articles **REFLECTION** and **REFRACTION** respectively.

Though the Greeks and their disciples the Arabs had made some progress in mathematical optics, their knowledge was confined to the law of reflection and its more immediate consequences. Euclid, Aristotle, Archimedes, Hero, and Ptolemy were acquainted with the fact that light is transmitted in straight lines; but, with the important exception of Aristotle and some of his followers, the ancient philosophers believed that rays proceeded *from* the eye *to* the object, instead of in the contrary direction. Ptolemy was well acquainted with atmospheric refraction. Alhacen (1070) and Vitellio the Pole (1260) were almost the only cultivators of this science during the middle ages, and their additions to it were unimportant. The lens, though known from early antiquity, was not applied as an aid to defective eyesight till after the time of Roger Bacon. Jansen, Metius, and Galileo separately invented the telescope about the beginning of the 17th century; and the last-mentioned philosopher by its means made various important astronomical discoveries. Kepler, a short time after, gave the true theory of the telescope, explained the method of finding the focal length of lenses, and applied it to find the magnifying power of the telescope

besides pointing out the mode of constructing an instrument better adapted for astronomical purposes than that of Galileo; he also made some useful experiments on the nature of colours, and showed that images formed on the retina of the eye are inverted, a fact previously discovered by Maurolycus of Messina. From this period the science of optics steadily advanced, and its treasury of facts received numerous additions through the labours of De Dominis, Snell (the discoverer of the law of refraction in 1621), Descartes, Fermat, Barrow, Mariotte, and Boyle. Up to the time of Newton it was generally believed that colour was produced by refraction, but that philosopher showed by a beautiful series of experiments that refraction only separates the colours already existing in white light. In his hands the theory and construction of the telescope underwent many valuable improvements, and in 1672 the description of his *reflecting* telescope was submitted to the Royal Society. Gregory had constructed an instrument on similar principles some years before. About the same time Grimaldi made his interesting series of experiments on the effects of diffraction, and noticed the remarkable fact of the interference of one pencil of light with the action of another. The theory of the rainbow, with an elegant analysis of the colours of thin plates, and the hypothesis concerning the nature and propagation of light, now known as the 'corpuscular' theory (see LIGHT), completed Newton's contributions to the science. The important services of the ingenious but eccentric Hooke cannot be easily stated in a brief abstract, as he discovered a little of everything, completed nothing, and occupied himself to a large extent in combating faulty points in the theories of his contemporaries. It must not, however, be forgotten that he has as much right as Huygens to the credit of originating the undulatory theory. The double refraction of Iceland spar was discovered (1669) by Bartholin, and fully explained in 1690 by Huygens, the propounder of the undulatory theory, who also aided the progress of mathematical optics to a considerable extent. The velocity of light was discovered by Römer (1675), and in 1720 the aberration of the fixed stars and its cause were made known by Bradley, who likewise determined with accuracy the amount of atmospheric refraction. Bouguer, Porterfield, Euler, and Lambert rendered essential service to physical optics; the same was done for the mathematical theory by Dollond (the inventor of the achromatic telescope), Clairaut, D'Alembert, Boscovich, &c.; while in later times the experiments of Delaval on the colours produced by reflection and refraction; the discussion of the phenomena arising from unusual reflection or refraction carried on by Vince, Wollaston, Biot, Monge, and others; the discovery of polarisation of light by Malus (1808), and its investigation by Brewster, Biot, and Seebeck; of depolarisation by Arago (1811), and of the optical properties as connected with the axes of crystals (1818) by Brewster; and the explanation of these and other optical phenomena in accordance with the undulatory hypothesis by Young—the discoverer of the *Interference* (q.v.) of rays—and Fresnel, went far to give optics a width of scope and a symmetry which are possessed by few other sciences. The development of the undulatory theory and of optical science generally has been carried on in the present century by Lloyd, Airy, Cauchy, Clerk-Maxwell, Hertz, and others; and for an account of the present state of the science reference may be made to Mr Thomas Preston's *Theory of Light* (1890), in addition to the works mentioned under LIGHT, and the articles LENSES, MICROSCOPE, TELESCOPE, &c.

Optimism (Lat. *optimus*, 'best'), the doctrine that the existing order of things, whatever may be

its seeming imperfections of detail, is nevertheless, as a whole, the most perfect or the best which could have been created, or which it is possible to conceive. Some of the advocates of optimism content themselves with maintaining the absolute position, that, although God was not by any means bound to create the most perfect order of things, yet the existing order is *de facto* the best; others contend that the perfection and wisdom of Almighty God necessarily require that His creation should be the most perfect which it is possible to conceive. The philosophical discussions of which this controversy is the development are as old as philosophy itself, and are dealt with in the article on the origin of Evil (q.v.). But the full development of the optimistic theory as a philosophical system was reserved for Leibnitz (q.v.), in his *Theodicæe*, the main thesis of which is that, among all the systems which presented themselves to the infinite intelligence of God as possible, God selected and created in the existing universe the best and most perfect, physically as well as morally, regard being had to the universe as a whole. The *Theodicæe* was designed to meet the sceptical theories of Bayle, and its theories were ridiculed in Voltaire's *Candide*. Modern discussion on this question usually assumes the form of assertion or denial of the opposite doctrine of Pessimism (q.v.).

Opuntia. See PRICKLY PEAR.

Opus Operatum (Lat., literally 'the work wrought') is the phrase employed in the Catholic theological schools to describe the manner of operation of the sacramental rites in the production of grace. It is intended to imply that the ministration of the rite (*opus*) is in itself, through the institution of Christ, an efficient cause of grace, and that, although its operation is not infallible, but requires and presupposes certain dispositions on the part of the recipient, yet these dispositions are but *conditiones sine qua non*, and do not of themselves produce the grace. Hence, when the sacraments are administered to dying persons in a state of apparent insensibility, this is done in the hope and on the presumption that the dying person may, though seemingly unconscious, be nevertheless really disposed to receive the sacrament; but it is by no means held that if these dispositions be wanting the sacrament will itself justify him.—The phrase *Opus Operantis* is frequently used as denoting that the effect of a particular ministration or rite is primarily and directly due, not to the rite itself (*opus*), but to the dispositions of the recipient (*operans*). Thus, in the act of kissing or praying before a crucifix, of sprinkling one's self with holy water, of telling the prayers of the rosary upon blessed beads, the fervour and personal piety of the supplicant, and not the material object of the religious use, is held to be the efficient cause of the grace which is thereby imparted.

Orache (*Atriplex*), a genus of plants of the natural order Chenopodiaceæ, having male and female flowers on the same plant. The species are numerous and widely spread over the maritime or saline parts of the earth, scarcely any species except the Common Orache (*A. patula*) being ever found inland or away from saline influence. Five species, including the Garden Orache (*A. hortensis*), are natives of Britain. Although formerly much cultivated in Britain, orache is now displaced as a pot-herb by spinach (*Spinacia oleracea*), a species of a closely allied genus. All the species have similar qualities, and may be used as spinach.

Oracle, the response delivered by a deity or supernatural being to a worshipper or inquirer; also the place where the response was delivered. These responses were supposed to be given by a certain divine afflatus, either through means of

mankind, as in the orgasms of the Pythia and the dreams of the worshipper in the temples; or by its effect on certain objects, as the tinkling of the caldrons at Dodona, the rustling of the sacred laurel, the murmuring of the streams; or by the actions of sacred animals, as exemplified in the Apis or sacred bull of Memphis, and the feeding of holy chickens among the Romans. Such responses were, however, closely allied to augury, which differed in this respect, that auguries could be taken anywhere, while the oracular spots were defined and limited. Oracle dates from the highest antiquity, and gradually declines with the decline of Animism (q.v.) and with the increasing knowledge of mankind. Among the Egyptians all the temples were probably oracular. In the hieroglyphic texts the gods speak constantly in an oracular manner, and their consultation by the Pharaohs is occasionally mentioned. In later days the most renowned of these oracles was that of Ammon in the Oasis, where oracular responses were rendered either by the shaking of the statue of the god or by his appearance in a certain manner. Oracles were also used by the Hebrews, as in the consultation of the Urim and Thummim by the high-priest, and the unlawful use of Teraphims, and consultations of the gods of Phœnicia and Samaria. The Hebrew oracles were by word of mouth, as the speech of God to Moses, dreams, visions, and prophetic denunciations; besides which there were oracles in Phœnicia, as that of Beelzebub and others of the Baalim. They were also in use throughout Babylonia and Chaldaea, where the responses were delivered by dreams given to the priestesses, who slept alone in the temples as concubines of the gods. The most renowned of all Greek oracles was the Delphic oracle (see DELPHI), which was Panhellenic or open to all Greece. Sacrifices were offered by the inquirers, who walked with laurel crowns on their heads, and delivered in questions inscribed on leaden tablets (of which many have been recently discovered); the response was deemed infallible, and was usually dictated by justice, sound sense, and reason. Other oracles of Apollo were at Abe in Phocis; at Ptoon, which was destroyed in the days of Alexander the Great; and at Ismenus, south of Thebes. In Asia Minor the most celebrated was that of Branchidæ, close to Miletus, celebrated in Egypt, Gryneum, and Delos. Besides that of Dodona, Zeus had another at Olympia; and those of various other deities existed elsewhere. A secondary class of oracles of heroic or prophetic persons existed in Greece, the two most celebrated of which were those of Amphiaraus and Trophonius. The first mentioned was one of the five great oracles in the days of Croesus, and was situate at Oropus in Attica. Those who consulted it fasted a whole day, abstained from wine, sacrificed a ram to Amphiaraus, and slept on the skin in the temple, where their destiny was revealed by dreams. That of Trophonius was at Lebadea in Boeotia, and owed its origin to a deified seer. It was given in a cave, into which the votary descended, bathed and anointed, holding a honeyed cake. There were some other oracles of minor importance. Besides these oracles, written ones existed of the prophetic of celebrated seers, as Bacis and Musæus, which were collected by the Pisistratidæ, and kept in the Acropolis of Athens. Others of the Sibyls or prophetic women were popular, and at a later period (see SIBYLS) Athenais and others prophesied in the days of the Seleucidæ. Amongst the oriental nations, as the Arabs and others, divination was and is extensively practised, but there are no set oracles. The Celtic Druids are said to have delivered responses, and the oracle of the Celtic god Belenus or Ábelio was celebrated.

Oran (Arab. *Waran*), a seaport of Algeria, stands on the Gulf of Oran, 261 miles by rail W. by S. of Algiers and 130 by sea S. of Cartagena in Spain. It climbs up the foot of a hill, is defended by detached forts, has a thoroughly French appearance, having been mainly built since 1790, when the older Spanish town was destroyed by an earthquake, and possesses a Roman Catholic cathedral (1839), a grand mosque, a large military hospital, a college, a seminary, and two citadels or castles. The harbour is protected on the north and east by moles constructed in 1887 at a cost of £280,000; alfa, iron ore, and cereals are the chief of the exports. Pop. (1886) 67,681. Oran was built by the Moors. During the second half of the 15th century it was a highly-prosperous commercial town, and was celebrated for its cloth and arms and fine public buildings. But it was taken by the Spaniards in 1509 and made a penal settlement. It was captured by the Turks in 1708, but retaken by the Spaniards in 1732. In 1790 it was destroyed by an earthquake, and shortly after was altogether abandoned by the Spaniards, the Turks occupying it again in 1792. The French took possession of the town in 1831.—The province of Oran has an area of 33,236 sq. m., and a pop. (1886) of 756,585, of whom 74,810 were French, 91,494 Spaniards, and 15,771 Jews.

Orang, or ORANG-OUTANG (*Simia satyrus*), an anthropoid ape, found only in the forests of Sumatra and Borneo. There is only one species, though it has been said that another smaller variety occurs in Borneo. The orang is distinguished from other anthropoid apes by its reddish-brown colour; and it has been noticed that the colour corresponds to that of its human neighbours, just as the black colour of the chimpanzee and gorilla answers to

Orang-outang (*Simia satyrus*).

that of the African tribes inhabiting the same country. Miklucho-Maklay asserts that the Malays never use their words *Orang utan* ('man of the woods') for any ape, but for an uncultured tribe of Malays living in the woods.

Like other anthropoids the orang is arboreal in

habit, and can move with considerable swiftness through a forest, passing from tree to tree; on the ground it is awkward. It has a curious habit of building among the branches a temporary hut or nest as it is usually called. The orang was formerly regarded as capable of all manner of iniquities, such as carrying off women and children, and throttling people with its hind-foot as they passed under the trees. When these beliefs were proved to be false they were transferred to the chimpanzee, and particularly to the gorilla. They were mainly dispelled by Wallace, who stated, however, of the orang that 'there is no animal in the jungle so strong as he; but strength does not necessarily imply ferocity, and the orang seems to be a very tamable creature.

Hornaday, an American traveller, observed the orang in the act of making its nest. He thus describes the process: 'I got there just in time to see the orang build a large nest for himself. He took up a position in a fork which was well screened by the foliage, and began to break off small branches and pile them loosely in the crotch. There was no attempt at weaving, nor even regularity in anything. He reached out his long, hairy arm, snapped off the leafy branches with a practised hand, and laid them down with the broken ends sticking out. He presently got on the pile with his feet, and standing there to weight it down, he turned slowly, breaking branches all the while and laying them across the pile in front of him until he had built quite a large nest. When he had finished he lay down upon it, and was so effectually screened from us that I could not dislodge him, and after two or three shots I told the natives that they would have to cut down the tree.' During one day's travel in Borneo thirty-six old nests and six fresh ones were seen; there appears to be nothing like house-building, which has been stated by some to exist among the oranges.

The structure of the orang shows its near relationship to the other anthropoids and to man. The curvature of the spine, which is an important character, appears, according to Cunningham, to be different from that of a full-grown man, but to correspond to that of a boy of six years old. The extension of the cerebral hemispheres in the brain backwards over the cerebellum is about equal to what is found in the chimpanzee; naturally this is considerably less than in man, but greater than in the new-born child. The orang comes nearest among the anthropoids to man in certain other characters, especially in brain characters; but, as the gorilla and chimpanzee show a nearer approximation in various other points, it would not be safe to call the orang the most man-like of apes. See ANTHROPOID APES.

Orange (Lat. *aurantium*; from *aurum*, 'gold'), the name of one or more species of *Citrus* (q.v.), of which the fruit is much prized. Botanists generally regard all the oranges as of one species, *Citrus aurantium*, but some make the Sweet Orange, the Bitter Orange, the Bergamot Orange, &c. distinct species. The wild state of the orange is not certainly known, although its characters may be pretty confidently inferred from the degeneration of cultivated varieties; and no cultivated plant shows a greater liability to degenerate, so that seedling oranges are almost always worthless. From a remote antiquity it has been cultivated in India; and thence it seems to have spread into western Asia and Europe. It has been alleged that the orange is a native of North America, near the Gulf of Mexico; but the probability rather seems to be that it has been introduced, and has become naturalised.

The Common Orange, or Sweet Orange (*Citrus aurantium*), is an evergreen tree of moderate size,

with greenish-brown bark; the leaves oblong, acute, sometimes minutely serrated, the leaf-stalks more or less winged, the flowers white, the fruit roundish, the oil-cysts of the rind convex, the juice sweet and acid. It is cultivated in almost every part of the world of which the climate is warm enough, but succeeds best in the warmer temperate or subtropical climates, as in the south of Europe, where it is very extensively cultivated, as far north as the south of France. The orange

does not seem to have been cultivated by the Greeks or Romans, but was probably brought to Europe by the Moors, and is supposed to have been introduced into Italy so recently as the 14th century, fully 1000 years after the citron. In the north of Italy oranges are sometimes grown in conservatories, but often in the open air, except during winter, when they are covered with temporary houses of boards. In the south of England they are sometimes in like

Sweet Orange (*Citrus aurantium*),
Branch in Flower :
a, fruit; b, transverse section of same.
(Bently and Trimen.)

manner grown in the open air, with a shelter of boards or matting in winter, but trained against a south wall; they attain a large size, and yield good fruit. The abundant importation of the fruit, however, renders the cultivation of the orange in Britain unnecessary; and, in general, only small plants are to be seen in greenhouses or conservatories, as mere objects of interest. In some parts of Queensland and south-west Australia the orange is grown to great perfection, but its culture does not appear to be regarded as a profitable industry—probably owing to the absence of markets and the facilities of conveyance thereto. A few counties in the colony of New South Wales appear to be particularly well adapted to orange cultivation. A government report on the area under orangeries gives it as 10,857 acres in 1889. Excellent oranges have been exported from the colony to Britain at remunerative rates. There are many varieties in cultivation, which are perpetuated by grafting upon seedling orange stocks and by layers. The principal orange-growing sections of the United States are Florida, Louisiana, and California.

Of the varieties of the sweet orange perhaps the most deserving of notice are the Portugal or Lisbon Orange, the most common of all, having the fruit generally round or nearly so, and a thick rind; the China Orange, said to have been brought by the Portuguese from China, and now much cultivated in the south of Europe, having a smooth thin rind and very abundant juice; the Maltese or Blood Orange, remarkable for the blood-red colour of its pulp; the Egg Orange, having fruit of an oval shape; the Mandarin Orange, or Clove Orange (*C. nobilis*), has fruit much broader than long, with a rind very loosely attached to the flesh, and small leaves; and the Tangerine Orange, apparently derived from the Mandarin. The St Michael's

Orange appears to be a sub-variety of the China orange. The Majorca Orange is seedless. The Kum-quat (*C. japonica*) is a very small tree, with fruit as large as a gooseberry: a native of China and Japan, it has been introduced into Australia.

The Bitter Orange, Seville Orange, or Bigarade (*C. vulgaris*, or *C. bigaradia*), is distinguished from the sweet orange by the more truly elliptical leaves, the acid and bitter juice of the fruit, and the concave oil-cysts of its rind. Its branches are also spiny, which is rarely the case with the sweet orange. The varieties in cultivation are numerous. The bitter orange was extensively cultivated by the Moors in Spain, probably for medicinal purposes, as stomachic and tonic. Its chief use, however, is for flavouring puddings, cakes, &c., and for making marmalade. The Bergamot Orange (*C. Bergamia*) is noticed in a separate article.

Orange-leaves are feebly bitter, and contain a fragrant volatile oil, which is obtained by distilling them with water, and is known in the shops as *Essence de Petit Grain*. Orange-flowers yield, when distilled with water, a fragrant volatile oil, called *Oil of Neroli*, which is used in making *Eau de Cologne* and for other purposes of perfumery. The flowers both of the sweet orange and of the bitter orange yield it, but those of the bitter orange are preferred. Dried orange-flowers, to be distilled for this oil, are an article of export from the south of Europe. They are packed in barrels, and mixed with salt. The dried flowers have a yellowish colour; the fresh flowers are white and very fragrant. The use of them as an ornament in the head-dress of brides is common throughout great part of the world. The small green oranges, from the size of a pea to the size of a cherry, which fall from the trees, both of the sweet orange and the bitter orange, when the crop is too great to be brought to maturity, are carefully gathered and dried, and are the *Orange berries* of the shops. They are used in making Curaçoa, and yield a fragrant oil on distillation, the original *essence de petit grain*. The dried and candied rind of the ripe bitter orange, well known as *Orange-peel*, is used as a stomachic, and very largely for flavouring puddings and articles of confectionery. The rind of the sweet orange is sometimes employed in the same way, but is inferior. A fragrant essential oil is obtained from the rind of the orange by distillation with water, and is sold by perfumers as *Oil of Sweet Orange*, or *Oil of Bitter Orange*, according as it is obtained from the one or the other, although the two kinds of oil are very similar. The rind of the orange is used in the preparation of a fine liqueur called *Orange Rosoglio*, which is an article of export from some parts of Italy. Besides the use of the sweet orange as a dessert fruit, and as a refrigerant in cases of sickness, its juice is extensively used as a refrigerant beverage, and is valuable in febrile and inflammatory complaints.

Orange-trees are often extremely fruitful, so that a tree 20 feet high and occupying a space of little more than 12 feet in diameter sometimes yields from 3000 to 4000 oranges in a year. One tree in Florida has often borne 10,000 oranges in a single season. The orange-tree attains an age of at least 100 to 150 years. Young trees are less productive than old ones, and the fruit is also less juicy, has a thicker rind, and more numerous seeds.

The fruit of the orange-tree is of great commercial importance, for not only is it one of the most delicious and wholesome of fruits, but fortunately it is also the most easily kept and carried from place to place. No fresh fruit possesses in the same degree as the orange and its congeners, the lemon, citron, lime, &c., the property of being easily packed in boxes when nearly ripe, and being in that state able to stand the close confinement

of a ship's hold during a voyage of two or three weeks. The orange is much cultivated in the Azores, Malta, Sicily, Spain, Portugal, the Syrian coast, and latterly in Florida, and it is from these localities that Britain receives its supply. Those from St Michael's, one of the Azores, and from Malta are the best varieties in the English markets; but the Mandarin Orange of China and the Navel Orange of South America are much superior. The latter occasionally reach Britain in small quantities from Brazil; they are nearly double the size of the ordinary orange, and have a peculiar navel-like formation on the top of the fruit, which is somewhat oval in shape.

Oranges when gathered for export must not be quite ripe; those fully formed and with the colour just turning from green to yellow are chosen. Each is wrapped in a piece of paper, or in the husk of Indian corn, and they are packed in boxes and half-boxes, chests and half-chests—the former are the Sicilian packages, the latter are St Michael's, Spanish, and Portuguese. A box contains about 250, a chest about 1000 oranges.

Orange-peel, or the rind of the orange, is used both in medicine and in confectionery—for the former purpose it is merely cut into long strips, and dried; for the latter it is carefully separated, either in halves or quarters, from the fruit, and, after lying in salt water for a time, is washed in clear water, and then boiled in syrup of sugar, or candied, and is sold extensively as candied peel. The rinds of the citron and lemon are treated in the same manner.—The wood of the orange-tree is yellowish white and close-grained. It is used for inlaying and for turnery.

The orange may be successfully cultivated in climates the winter temperature of which does not fall below 40°. The tree prefers strong loam or clayey soil, but succeeds in any kind of soil if well fertilised. See Dr Moore's *Handbook of Orange Culture* (New York and Lond. 1885); and United States Consular Report on *Fruit Culture* (1890).

Orange, or GARIEP, the largest river of South Africa, rises in the Kathlamba Mountains, in the east of Basutoland, and flows west, with an inclination to the north, to the Atlantic Ocean. It describes numerous wide curves in its course of 1000 miles, and separates Cape Colony, on the south, from the Orange Free State, Griqualand West, Bechuanaland, and Great Namaqualand, on the north. Area of basin, 325,000 sq. m. Its principal tributaries are the Caledon and the Vaal, both joining it from the right. Its volume varies greatly between the dry season, when it is not navigable, and the rainy season, when it overflows its banks in the upper parts of its course. Its mouth is, moreover, obstructed by a bar.

Orange, a town in the French department of Vaucluse, on the left bank of the Aigue, 18 miles by rail N. of Avignon. The *Arausio* of the Romans, which contained 40,000 inhabitants, it retains two splendid Roman remains—a triumphal arch, 72 feet high, and a theatre whose façade was 340 feet long by 118 high. A neighbouring circus has been swept away. There is a Romanesque cathedral, and statues of two of the counts. Pop. 6904.

Orange was the capital of a small independent principality, which was ruled by its own sovereigns from the 11th to the 16th century. The last of these sovereigns, Philibert de Chalons, died in 1531 without issue. His sister, however, had married a Count of Nassau, and to that house the estates and titles passed. The Count of Nassau who obtained the principality of Orange was the father of William the Silent (see HOLLAND, Vol. V. p. 742). William

III., Prince of Orange and king of England, having died in 1702 without issue, there began a long-continued controversy as to the succession between Frederick I. of Prussia (as grandson of one of the last princes of Orange), the representative of the older branch of the House of Nassau (q.v.), and the head of the younger line. At the peace of Utrecht (1713) the king of Prussia took the settlement into his own hands, so far as the territory of Orange was concerned, by making it over for certain equivalents to the king of France. The title Prince of Orange, however, remained with the younger Nassau line, afterwards sovereigns of Holland. See Bastet's *Histoire d'Orange* (1856).

Orange, a city of New Jersey, 12 miles W. of New York by rail, and 3 miles by tram-car from Newark. The slope of Orange Mountain is laid out in beautiful parks, and ornamented with villas. There are manufactures of hats, carriages, &c. Pop. (1880) 13,207; (1890) 18,844.

Orangemen, an organisation which had its origin in the hostility that subsisted between Protestants and Catholics in Ireland from the Reformation downwards, though the term is first used after the Revolution of 1688. The members of the Protestant associations appear at first to have been known by the name of 'Peep-of-day Boys'; but the rude and illiterate mob of Peep-of-day Boys made way for the rich and influential organisation of the Orange Society. Its name was taken from that of the Prince of Orange, William III., who in Ireland has been popularly identified with the establishment of that Protestant ascendancy which it was the object of the Orange association to sustain. The first 'Orange Lodge' was founded in the village of Loughgall, County Armagh, September 21, 1795. Lecky holds that the first Orange rising was brought about by the restlessness and discontent of the Catholics, consequent on the withdrawal of Earl Fitzwilliam and the collapse of his schemes of Catholic emancipation, and was really a plan to expel all Catholics from Ulster, and drive them to Connaught or elsewhere. The immediate occasion of the crisis was a series of outrages by which Catholics were forcibly ejected from their houses and farms, terminating (September 1795) in an engagement, called, from the place where it occurred, the Battle of the Diamond. The rebellion of 1798 inseparably combined the religious with the political antipathies. In November of that year the Orange Society had already reached the dignity of a grand lodge of Ireland, with a formal establishment in the metropolis; and in the following years the organisation extended over the entire province of Ulster, and had its ramifications in all the centres of Protestantism in the other provinces of Ireland. In 1808 it extended to England. A grand lodge was founded at Manchester, but transferred to London in 1821. The subject more than once was brought under the notice of parliament, especially in 1813, and in consequence the grand lodge of Ireland was dissolved; but its functions in issuing warrants, &c. were discharged vicariously through the English lodge. The most memorable crisis, however, in the history of the Orange Society was the election of a royal duke (Cumberland) in 1827 as grand master for England, and, on the re-establishment of the Irish grand lodge in 1828, as imperial grand master. The Catholic Relief Act of the following year stirred up all the slumbering antipathies of creed and race, and the Orange association was propagated more vigorously than ever—not only in Wales and Scotland, but also in Canada and in the other colonies; and it extended its ramifications into the army. In 1835 the association numbered 20 grand lodges, 80 district lodges,

1500 private lodges, and from 200,000 to 220,000 members. After a protracted parliamentary inquiry in 1835 the lodges were formally suppressed, though the institution afterwards gradually revived as a secret society. In 1861 there were 150,000 members in British America. Great days in the association are the 5th of November, the anniversary of William III.'s arrival in Torbay; and the 1st and 12th of July, the anniversaries of the battles of Aughrim and the Boyne. Serious riots took place in New York on July 12, 1871, and at Belfast in 1880 and 1886. See Lecky's *History of England in the Eighteenth Century*, vols. vii. and viii. (1890).

Orange River Free State, a republic of Dutch Boers in South Africa, lying between the Vaal and Orange rivers, on the north and south respectively, and between Griqualand West and the Drakenberg Mountains on the east. This region is a plateau, rising from 3000 to 5000 feet above the sea-level, with very little wood, except alongside the numerous watercourses that traverse it. Its vast undulating plains slope down to the Vaal and the Orange, and are dotted over with isolated hills called 'Koppies'—magnificent pasture-land. Area, estimated at 41,500 sq. m.; pop. (1880) 133,518 (of whom 61,022 were whites). When the Dutch Boers left the Cape Colony (1836) and took possession of this country it was inhabited by Bushmen, Bechuanas, and Korannas. Pastoral pursuits predominate—the rearing of merino sheep, cattle, horses, goats, and ostriches. Corn (wheat, maize, Kaffir corn) is grown, chiefly in the east. Coal is mined in the north and diamonds in the south-west, towards Kimberley. The climate is healthy and temperate. The country is governed by a president, elected by the people for five years; an Executive Council, consisting of the president and two official and three unofficial members; and the Legislative Council of fifty-seven members, elected by all adult white males. The state is financially in a flourishing condition. In case of necessity all able-bodied citizens are liable to be called upon for its defence; there are no fortifications, and by way of a standing army one battery of artillery worked by less than sixty men. A railway line is being built from the Orange River to Bloemfontein (q.v.), the capital. Commerce, exports (wool, diamonds, hides, ostrich-feathers, and live animals) and imports, passes through the ports of Cape Colony and Natal, and reaches an estimated total of 3 millions sterling. Education stands at a fairly high level amongst the whites; the prevailing religion is the Dutch Reformed. The Cape government appointed a resident in the republic in 1845, and three years later it was annexed to the British crown as the Orange River Sovereignty; but in 1854 it was given up to the Boers, who formed themselves into the independent republic of the Orange River Free State.

See Norris-Newman, *With the Boers in the Transvaal and Orange Free State* (1882); Anthony Trollope, *South Africa* (2 vols. 1878); E. de Weber, *Quatre Ans aux Pays des Boers* (1882); and Theal's *History of the Boers in Southern Africa* (1887).

Oratorio (*Dramma sacra per la Musica*), a sacred story set to music, which, as in the opera, requires soloists, chorus, and full orchestra for its performance, the theatrical adjuncts, however, of scenery, costumes, and acting being dispensed with. It receives its name from the oratorio or oratory of the church of Santa Maria Maggiore, near Rome, where St Philip Neri arranged musical performances (1571–84), which developed into the modern oratorio. These performances were prompted by the same spirit which had in the miracle and mystery plays of the middle ages sought to interest and educate the unlearned.

The effort to find a more dramatic vehicle of expression which had proved in Florence the germ of Opera (q.v.) was also being made in Rome by Emilio del Cavaliere. And by a curious coincidence the first oratorio and the first opera (properly so called) were produced in the same year (1600) in these two cities. Cavaliere's oratorio, which was written throughout in recitative style, was called *La Rappresentazione dell' Anima e del Corpo*, and the directions for acting, dressing, and dancing, as well as singing, show how entirely the conception of oratorio has changed since its first rude beginning. During the 17th century Carissimi and Scarlatti wrote many works full of expression, but the Italians were, as a rule, more engrossed with the development of opera. Indeed, save in such expressive works as Carissimi's *Jephtha*, Stradella's *John the Baptist*, and the like, there is no difference between opera and oratorio composition, and it was among the graver nations of the North that the oratorio was to arrive at its maturity. There the first and almost universal subject was the Passion; and to illustrate the story and direct the meditations of the devout, Schütz, Graun, Handel, and Bach employed all their skill in musical construction, and all the resources which counterpoint, harmony, and orchestration could afford them. Solid part-writing for voices is absolutely necessary for such impressive and serious works as oratorios, and it is the neglect among the Italians of the art they had brought to such perfection during the 16th century which has caused the crown to pass from Italy to Germany. The greatest 'Passion Music' is the *St Matthew*, written for service on Good Friday, 1729, by Seb. Bach. It contains choruses, solos, and chorales (in which the congregation took part), all of surpassing interest and beauty, and showing when requisite great dramatic truth and force. And as this work is the climax, so it is the close of passion music development.

The next and most important phase of oratorio was the *Epic*, which became in Handel's giant hands such a powerful instrument. Before he wrote *Saul and Israel in Egypt* (1739) he had written an early oratorio in the Italian, and Passions, &c. in the German style. Between his arrival in England (1710) and his abandonment of the opera he had in no fewer than forty-four operas accustomed himself to all the possibilities of vocal expression; and his Italian training, his studies in Germany, and his varied experience eminently fitted him for his task. In twelve years he composed fifteen grand oratorios (*Israel in Egypt*, *Messiah*, *Samson*, *Judas Macabæus*, *Joshua*, *Solomon*, *Jephtha*, &c.), besides several cantatas and anthems of almost oratorio dimensions. The greatest is *Israel in Egypt*, with its massive double chorus-writing and its grand effects; but the *Messiah* is a work which stands out not only among oratorios, but in all musical literature as a great inspiration. Pure inspiration it must indeed have been, for it was written in twenty-four days! The great admiration for Handel's compositions in England finds expression every three years in the Handel Festival, held in London, at which the *Messiah*, *Israel in Egypt*, and a 'selection' are performed on a gigantic scale (about three thousand singers and five hundred instrumentalists).

Haydn heard Handel's works when he visited England in 1791-92, and was incited to the composition of his great oratorio, the *Creation* (and also the charming pastoral the *Seasons*, which should scarcely be called an oratorio); in fact, Handel has been the inspiration and model of nearly all succeeding oratorios, as England, his adopted country, has been oratorio's peculiar home. There the unequalled choruses and the general custom of choral festivals on a large scale

offer numerous opportunities for producing familiar masterpieces and inducements to compose new works. For the Birmingham Festival of 1846 Mendelssohn wrote his masterpiece, the *Elijah*, a work of great originality, which, however, owes more to the influence of Bach than of Handel. *St Paul* was produced at Düsseldorf ten years earlier.

Daring orchestral colour and original effects characterise Spohr's oratorios, *Last Judgment* (1826), *Calvary* (1835), and *The Fall of Babylon* (1842). Modern oratorios take advantage of the dramatic element which is so strong in the music of the 19th century, and in many works the name is modified (e.g. Dramatic Oratorio—Mackenzie's *Rose of Sharon*, Parry's *Judith*, &c.) or avoided (Sacred Trilogy—Gounod's *Redemption*, Berlioz's *Childhood of Christ*, &c.). Dvorák's *St Ludmila* and Liszt's *St Elizabeth* and *Christus* lean more and more to the form of dramatic cantata, of which Beethoven's *Mount of Olives* (miscalled an oratorio), Schumann's *Paradise and the Peri*, Sullivan's *Golden Legend*, and Mackenzie's *Dream of Jubal* and *Sayid* are fine examples.

To treat of the large field thus opened to modern composers in the dramatic cantata, sacred and secular, would lead us far beyond the limits of this article; reference must be made to musical dictionaries, as well as, more strictly for Oratorio, to Bitter's *Geschichte des Oratoriums* (1872), Wangemann's *Geschichte des Oratoriums* (1882), Rockstro's careful article in Grove's *Dictionary*, and Upton's *Standard Oratorios* (Chicago, 1887).

Oratory of St Philip Neri, CONGREGATION OF THE. The origin of the Congregation of the Oratory has been described in the article on St Philip Neri, its founder (see NERI). Here something must be said of its constitution and work. The primary idea of the institution was that its members should be bound by no religious vows. They were to be secular priests living together under a common rule, and practising obedience as free subjects, with liberty to quit the community if they so willed. Each father must contribute an annual pension towards the upkeep of the house, and have, moreover, a sufficiency of private means for his personal expenses. Otherwise he has absolute control over his own property. The government of the congregation is of a remarkably republican character. Each community is entirely independent, being subject to no mother-house or general superior. The community is composed of three classes—the novices, triennial and decennial fathers. A member after passing his novitiate becomes a triennial father, with a consultative voice in the affairs of the congregation. On the completion of his tenth year he becomes a decennial father, with a decisive vote. The superior, who is generally spoken of as 'the Father,' is elected every three years, and with him are elected four deputies, who form a committee which meets weekly, has the appointment of the other officers, distributes the ecclesiastical work, and controls the ordinary expenditure. But no large expenditure or new undertaking can be entered upon without the consent of the general congregation, where in all cases the voting is by ballot. The father superior, *primus inter pares*, has no privileges and is exempt from no rules. He takes his turn in the waiting at table in the refectory, and has his share in the work of the church. The principal religious exercise of the community, beyond the duties common to all priests, is half-an-hour's mental prayer in the evening followed by the litanies, for which three times a week is substituted the taking of 'the discipline' or self-flagellation in a darkened room. The ceremonial for this exercise will be found described in Hone's *Ancient Mysteries*. The ministerial work of the Oratory consists chiefly in

constant attendance in the confessional and in the characteristic daily preaching. Another essential part of the institute is an external brotherhood similar in some respects to the 'Third Orders' of the older religious orders, but consisting of men only, who meet in a separate chapel called the Little Oratory, under the direction of a father prefect. The brothers, as a rule, observe the same exercises as the fathers. It is in the Little Oratory that the musical services which originated the oratorio are held. Music was so often performed in the oratory at Seville that Blanco White speaks of it as the 'spiritual opera-house.' Philip Neri, who governed the community at Rome as long as he lived, committed no rule to writing. The traditional rules drawn up at a later time were approved by Paul V. in 1612.

The Oratory spread rapidly through the chief cities of Italy, and there were several houses in Spain. In Germany it never took root. In France Cardinal de Bérulle took the institute as his model in a new foundation (1611), approved by Paul V. in 1614, under the name of the 'Congregation of the Oratory of our Lord Jesus Christ in France.' But it differs essentially from the Oratory of St Philip Neri. It was governed by a superior-general, and was mainly concerned with the institution of seminaries for the training of priests.

The life in the Roman Oratory admitted leisure for private study; and the founder, in encouraging Cesare Baronio to write his great work on church history, set an example which was followed by many distinguished scholars—Bozio, Gallonio, Aringhi (*Roma subterranea*), Bianchini (*Evangelium quadruplex*), Gallandi (*Bibliotheca patrum*), and others. It was natural that the character of Philip Neri and the community life which he established should have a particular attraction to a number of men from the English universities, who were led by the Oxford movement to the Church of Rome. Dr Newman when at Rome obtained from the pope a brief (26th November 1847) authorising him to establish the Oratory in England. Shortly afterwards F. W. Faber, who had founded a new order, 'the Brothers of the Will of God,' generally known as 'Wilfridians,' joined, with his whole community, the Oratory at Birmingham. In 1849 Father Faber was sent to London with some other fathers to set up a house in King William Street, Strand, which in October 1850 was constituted an independent congregation, and in 1854 was transferred to its present abode in Brompton.

There seems to have been a project of introducing the Oratory into England in the reign of James II., and there is in the British Museum an extremely rare if not unique copy of an English translation of the Rule printed in 1687.

The early history of the Oratory was written in 5 vols. folio by Marciano, *Memorie Storiche*, &c. (1693-1702). Compare Newman's *la Religione Cattolica in Inghilterra, ovvero l'Oratorio Inglese*, by Capeceletro (Naples, 1859), and *Life and Letters of F. W. Faber*, by J. Bowden (1869). The *Instituta Congregationis Anglicæ* was printed in Rome at the Propaganda Press in 1847.

Orbis Pictus. See COMENIUS.

Orbit, in Astronomy, is the path described in space by a heavenly body in its revolution round its primary. The path so described is of an elliptic form, and would be accurately an ellipse were it not for the disturbing influence of the other heavenly bodies (see PERTURBATIONS). The complete determination of a planet's orbit is of the last importance to astronomers, as it enables them to predict the planet's place in the heavens at any period, and thus determine the exact date of eclipses of the sun and moon, of transits and occultations of the planets, and of the appearances and disappearances of comets. For the determination

of a planet's orbit it is necessary to know three things: (1) The situation of the *plane* of the orbit in space; (2) the position of the orbit in this plane; and (3) the situation at a given epoch, and rate of motion, of the planet in its orbit. Since the plane of the ecliptic is for convenience taken as the reference plane, the position of the plane of a planet's orbit is known when (1) its inclination to the plane of the ecliptic and (2) the line of intersection of the two planes are known.

Orcagna, whose real name was *Andrea di Cione* and his nickname ARCAGNUOLO ('archangel'), corrupted into Orcagna, was a painter, sculptor, and architect, as well as a maker of poems. Born, about 1316, the son of a Florentine worker in silver, he was early imbued with artistic tastes. Sculpture he learned in the studio of Andrea Pisano, and in painting was helped by an elder brother. In 1355 he was appointed architect to the church of Or San Michele in his native city; his greatest artistic triumph exists in the marble tabernacle in this church. 'This, in its combined splendour of architectural design, sculptured reliefs and statuettes, and mosaic enrichments, is one of the most important and beautiful works of art which even rich Italy possesses. It combines an altar, a shrine, a reredos, and a baldacchino' (Middleton). From 1358 to 1360 he was chief architect of the cathedral at Orvieto, for which he designed some mosaic pictures. In Florence he planned a mint, piers in the cathedral, and other works. His earliest achievement with the painter's brush was to execute, in conjunction with his elder brother Nardo, several frescoes in the church of Santa Maria Novella at Florence. Some of these have perished; but a 'Last Judgment' and 'Christ and the Virgin enthroned in Heaven' still survive, though greatly restored. Other frescoes in the cemetery at Pisa that were attributed to Orcagna are now believed to have been by a painter or painters of the Siennese school. Orcagna painted several panel pictures, including a retable for the altar in the Strozzi chapel of Santa Maria Novella; another for the church of San Pietro Maggiore in Florence, now in the National Gallery, London; an altarpiece in the chapel of the Medici (Santa Croce), Florence; and 'St Zenobius Enthroned,' in the cathedral of Florence. Orcagna's death is usually given as 1389; but 1376 seems a more likely date, or even 1368. See the article by Professor J. H. Middleton in *Ency. Brit.*; and Crowe and Cavalcaselle, *Painting in Italy*, vol. i. (1864).

Orchard (generally supposed to be from A.S. *ort-gearde*—i.e. a yard or enclosure for orts, worts, or wurts = Lat. *olus*, but strangely resembling the Gr. *orchatos*, especially in the Miltonic form, *orchat*) is a space of ground employed for the growth of hardy tree-fruit, such as apples, cherries, pears, and plums. By common usage and the force of climate the word in Great Britain has now become suggestive of apples only; and if the fruit be of any other staple a special prefix is generally employed, except in the counties (and few they are) in which cherries, pears, or plums are grown thus largely, such as Kent, Hereford, and Worcester. In some parts of the United States peaches are grown in vast quantities upon orchard-trees, and that fruit can be ripened thus in the southern counties of England, when the spring and summer have been favourable. But in the main with us the orchard is a plot of ground planted with apple-trees, and thus we shall chiefly regard it.

In England, as well as the more fruitful parts of Scotland, the manor-house, vicarage, manse, or farm, or other well-environed dwelling-place, has its own orchard not far from the house, and capable of producing fruit, unless too much discouraged.

Too often the orchard is treated with contempt, as a space where the children, turkeys, calves, or pigs may roam at pleasure; and if there are any apples they are regarded as a windfall of some rarity. This is not as it ought to be. Orchards were laid out at a time when there was room enough to move freely, and people knew less than they seem to know now. Accordingly we find on these old trees either no fruit at all, or very little, and of that the chief part worthless. There is no greater puzzle to the farmer or squire farming his own land than the sad condition of his orchard and his own deep ignorance about it. Amid the more important works the trees have too often been neglected; and the space which should yield its fair share of profit, as well as of picturesque enjoyment, has become a frowsy wilderness.

Much of the blame for this would fall on those who are now beyond it. Seldom indeed can we find an orchard planted by our ancestors with any common sense or judgment. The trees have been placed there anyhow, without any knowledge of their habit, growth, fertility, use, or requirements. And for this the nurserymen of that time must also be held accountable, their ignorance of their own produce having been equal to that of their customers. In this particular a vast advance has been made in the last half-century, and the planter of an orchard now has himself to thank if he plants amiss. For of late years it has been imagined largely that profit, equally speedy and heavy, can be secured very pleasantly by the growth of fruit in Britain. In spite of all experience this may be so, as we find the laws of nature overcome now and then by superhuman effort. And when everything comes to pass exactly as it should, the orchard takes occasion sometimes to pay its way. With a view towards this we may consider first the formation and planting of an orchard; secondly, the renewal of an old and not too hale plantation.

(1) Situation and soil are the first two questions, the former being even the more important in the colder parts of Britain. A slope towards the south or south-east is best of all; but if that cannot be found a fair level will do, unless it be in the bottom of a valley or too near some broad river. A damp situation is always bad; and especially evil is the spot—though it may be the warmest in summer—where the fog of the morning draws and packs from the marshes or from a tidal river. For the worst of all enemies to British fruit is the late spring frost, which settles chiefly in the valley or along the plain; whence the bleak hillside is often fruitful when the sheltered dale is barren. Also the soil must be fairly good, neither too sandy nor of very heavy clay. When the site has been chosen the ground should be trenched to the depth of two feet if possible, and drainage provided where needful, as in all but the most favoured spots it is. Time for settlement should be allowed after the trenching; and then the stations may be prepared for the standard-trees. The distance from tree to tree and row to row ought to be governed by the choice of kinds, and this again depends upon the object of the planter. He may plant for home use, or for sale, or for both; and in either case for table use or for cider. If he plants for his own table use—be it for cooking or dessert—his chief concern is quality combined with fair fertility. If he plants for market he must first consider productiveness and appearance and the common opinion of his neighbourhood; for if he took into the market the best apple ever grown, but as yet of no reputation, he would have to take it home again until the trees grew old. Also, he would rather sell good fruit than bad; but generally speaking this is difficult without much self-sacrifice. For the

finer kinds are, with few exceptions, less fertile than the inferior. But whatever his objects be, and whatever varieties he selects, the planter must be guided by the habit of the trees as to the space allowed them. It is better to allow too much room than too little; and in a plantation intended to endure, 25 feet from tree to tree is not one too many. The permanent trees should be straight standards, worked upon the crab-stock, and with 6 feet of stem from the root to the spread of the branches. Let them be planted almost upon the surface, then banked up with good soil, and staked securely, until they can hold their own against the wind. Of pruning little or none is required during the first year of their growth, except that any weak shoot should be cut out, or rival to the leader repressed at once, if the tree is to be carried up in conical form. No manure should be given as yet, unless it be in the way of mulching, where the soil is very droughty. When all the standards are planted and staked, and seen to 'cut true,' as gardeners term it, both along and across the rows, the temporary crop may be planted among them, whether of dwarf-trees, or of bushes, vegetables, clover, or anything else; but a clear space must be reserved at all times of at least a yard around the orchard-tree. And throughout the next year the young plantation must be heeded frequently, disfruited (if any rash produce form), watered in case of protracted drought, restaked or rebound if any break loose, and watched that no grub or other vermin bore the slender stem, or injure bark, branch, or foliage. In the second year judicious pruning will be needed, for which see our article on that subject. The ground between the trees may be cropped with grass or clover (not allowed to become too long), which can be broken up for the purpose of manuring, and at other times saves the dropping fruit from bruises. With regard to varieties it is quite impossible to offer useful advice without a knowledge of each special case. If the planter is providing for his own household he generally knows what suits it best and befits the situation. If he grows for market he can have recourse to the counsel of some good nurseryman acquainted with the neighbourhood, its wants and suitabilities; he will probably find his trees true to name, clean, well grown and healthy; for in no line of business has there been more advance during the last half-century than in that of the nurseryman.

(2) With regard to the renewal of an ancient fruit-grove or the way to make the best of it, any one coming into possession or management of a decrepit orchard may wisely allow one fruiting season to show what good there is in it. All trees of valuable kind may then be marked for better cultivation, while the rest are divided into those worth grafting and those that are worthy of the domestic hearth; and the last will perhaps be more numerous. The trees that have goodness or beauty of fruit, with vigour sufficient to carry it, should at once be relieved of all moss and decay, straggling or worn-out or ill-placed members, or thickety growth of feeble wood, and perhaps in some places be cut back with discretion. Then the ground should be opened around the trunk, with tender avoidance of all upper roots (if any still live as a rarity), and a mulching of good, rich manure should be laid on in the winter-time; or, failing such encouragement, a frequent supply of good liquid strength, when the roots are on the feed in summer-time. The difficulty is to get this new supply to the parts that are fit to take it up, and then to provide the proper dose. And none but a man who knows the nature of a tree should be permitted to attempt it. Too often the roots of these old trees are prongs that strike downwards mightily, in the manner of a well-

grown carrot, leaving nothing with a mouth for better feeding reasonably near the surface. Little improvement must be looked for during the first season, but even then there should be symptoms of increasing vigour, and in the second year the tree should be making healthy growth again.

Those that are of inferior kind, but have kindly wood for grafting, should be headed back or shortened home, with the dry and ragged wood removed. Then in the spring let fair stout scions of the better sort be inserted, chosen from strong growers, such as impart their own vigour to the stock; for it is vain to work a feeble kind upon a long-established tree. The result will sometimes be a great success and sometimes downright failure, according to the harmony of stock and graft, upon which point the most experienced gardener as yet knows very little.

Many old trees, as before suggested, will be fit for nothing but firewood. These should be grubbed up at once, not with a feeble hand, but following every root as if you hated it. Then let a large space be excavated and filled in with abundant fresh soil trodden at every layer, and upon this young standards of vigorous kind must be planted, as shallow as may be, and banked up and staked. None but the strongest and most rapid growers can hope to make good these gaps among the elders, and even so they will be long about it. The virtue of patience must be highly cultivated by the owner of an ancient orchard. Even for renewal of an old plantation little can be said as to choice of sorts without thorough knowledge of locality. Many apples that become a picture in Kent or Surrey or Devonshire are plain little dowdies in Yorkshire, and unsightly scrubs in Scotland; while others that are comely and good in the north are vapid in the southern counties. Again, few or none of the American kinds, so handsome and fine when imported, can be grown to perfection in Great Britain. The conferences of the Royal Horticultural Society have afforded most valuable hints upon this subject, and their report should be studied with care. Much may also be learned from recent treatises by pomologists, such as Dr Hogg's *Fruit Manual*, John Scott's *Orchardist*; the works of the late Thomas Rivers, and the fruit-lists of the present T. F. Rivers; the *Growth of Fruit for Profit*, by George Bunyard of Maidstone; and a concise work on the same subject by Mr Wright of the *Horticultural Journal*. See APPLE.

Orchardson, WILLIAM QUILLER, a genre-painter, who is considered to bear the palm in this branch of art, surpassing all other English physiognomists in accuracy, expression, and dexterous execution. He was born in 1835 in Edinburgh, where subsequently he studied under Scott Lauder at the Trustees' Academy; he became A.R.A. in 1868, R.A. in 1877, and received a Medal of Honour at the *Exposition Universelle*, 1878. Best known among his exquisite and highly-popular pictures are 'The Challenge' (1865), 'The Duke's Antechamber' (1869), 'Casus Belli' (1870), 'The Protector' (1871), 'The Bill of Sale' (1875), 'The Queen of the Swords' (1877), 'A Social Eddy' (1878), 'Hard Hit' (1879), 'On board H.M.S. *Bellerophon*, July 23, 1815' (1880; bought by the Chantrey Bequest), 'Mariage de Convenience' (1884), 'After' (1886), 'The Salon of Madame Récamier' (1885), 'The First Cloud' (1887), 'Her Mother's Voice' (1888), and 'The Young Duke' (1889).

Orchestra (Gr., from *orcheomai*, 'I dance'), the part of the old Greek theatre where the chorus danced; in the modern theatre, the part set apart for the band; hence now frequently the band itself, in a theatre or at a concert. For the development

of the orchestra in this latter sense, and the partition of instruments in a representative orchestra, see MUSIC, p. 360. See also BAND, THEATRE.

Orchids (ORCHIDÆ or ORCHIDACEÆ), a natural order of endogenous plants distinguished from all other orders in the same alliance by their irregular gynandrous flowers and parietal placentæ. The essential peculiarities of the order are due to the consolidation of the stamens and pistil into one body called the *column*; to the suppression of all the anthers but one in all the genera except those comprising the tribe Cypripediæ, in which there are two anthers; to a peculiar condition of the pollen and the structure of the anthers containing it, and to the remarkable forms and development generally assumed by the lip (*labellum*)—one of the inner members of the perianth which often plays an important mechanical part in the fertilising of orchids. The species are perennial herbaceous plants or shrubs of terrestrial habit in the temperate and colder parts of the world, but in warmer countries become epiphytal, adhering to the stems and limbs of trees, or fixing themselves on rocks by their strong fasciculate roots without penetrating the structure of these, or having any direct connection with the soil. Hence they have been popularly named air plants, as those which assume the epiphytal habit derive the greater part of their nutriment from the atmosphere. Their roots are fibrous or fasciculate or fleshy and tuber-like, the latter being peculiar to the terrestrial species. Their stems are annual, herbaceous, perennial, and woody, and very often pseudo-bulbous. Their leaves are flat or round, equitant, and generally sheathing, often leathery, and having parallel nerves. The flowers are irregular, extremely variable in form, often beautifully coloured, and deliciously fragrant, and are either solitary or in spikes, racemes, or panicles. They are composed of six usually petal-like segments: the three outer ones are called sepals, and two of the inner ones, which are usually alike in form and colour, are called petals; the third inner one, which differs in shape and also generally in

Fig. 1.—*Cypripedium Boxallii*.

direction from the others, is the lip. Opposite to the lip in the axis of the flower is the *column*, bearing the anther or anthers with the pistil variously situated relatively to each other. The more obvious features described are well illustrated in the accompanying figures of *Cypripedium* (see also LADY'S SLIPPER), *Mormodes*, *Odontoglossum*, and *Oncidium*, in which the six segments of the perianth are so conspicuous as to reveal at a glance their structural relation to each other.

Orchids are found in almost all parts of the world, except in extremely dry climates and on the borders of the frozen regions. In Britain there are found sixteen genera and nearly forty species. In Europe, the temperate parts of Asia, in North America, and the Cape of Good Hope they are common inhabitants of groves, marshes, and meadows; and

in these regions they are invariably terrestrial in habit. But in the hot damp parts of the West and East Indies, in Madagascar, and other islands in the same region, in the moist forests of Brazil, the warm parts of Central America, and western Mexico they abound in the greatest profusion, no longer dependent on the soil for their nutriment, but clinging to the trunks and branches of trees, to stones and crags, where they vegetate among ferns and other shade-loving plants, or

Fig. 2.—*a*, *Masdevallia chimera*; *b*, *M. Schlumii*.

occupy by themselves exclusively the places which they affect. The family is a very numerous one, there being, according to the *Genera Plantarum*, 334 genera and about 5000 species known to botanists. Of exotic species Linnaeus knew only about a dozen a little over a century ago. About 2000 species have been introduced to cultivation. The beauty and the fragrance of the flowers, the singularity and almost endless variety of form which they exhibit, and their interesting structure botanically, along with the rarity of many of the most beautiful, place orchids among the most remarkable of the families of the vegetable kingdom. Darwin, who devoted much attention to the family, particularly in regard to their fertilisation, says of the peculiarity of the structure of the flowers of orchids that 'an examination of their many beautiful contrivances will exalt the whole vegetable kingdom in most persons' estimation,' and that 'hardly any fact has struck him so much as the endless diversities of structure—the prodigality of resources—for gaining the

Fig. 3.—*Mormodes Ocanne*.

same end, namely, the fertilisation of one flower with pollen from another plant.' This part of the history of orchids is, like every other point connected with them, too wide to be dealt with here in detail. Those, however, who desire to study

the matter closely should see the work quoted from—*The Fertilisation of Orchids*, by Charles Darwin.

Since the middle of the 19th century the cultivation of orchids in Britain, on the Continent, and in America has become an absorbing pursuit with wealthy amateurs. The possession of a rare or unique species or variety is an ambition that can only be attained by the millionaire: the prices of such are quite beyond the means of those possessed only of moderate wealth. Syndicates are formed for the purpose of collecting and importing orchids from all countries in which rare or otherwise valuable species are known to exist, and private persons and several of the leading London and continental nurserymen send experts in orchid-collecting to those countries at great expense with the same object in view. There is thus considerable commerce in orchids, in connection with which large sums of money are circulated annually. The genera which are in greatest request among amateurs are *Cypripedium*, *Dendrobium*, *Masdevallia*, *Odontoglossum*, *Cattleya*, *Laelia*, *Oncidium*, *Chysis*, *Cymbidium*, *Calanthe*, *Phalænopsis*, *Cœlogyne*, *Angræcum*, *Vanda*,

Fig. 4.—*Odontoglossum Harryanum*.

Anguloa, *Epidendrum*, *Sophranitis*, *Renanthera*, *Saccolabium*, *Miltonia*, *Peristeria*, *Lycaste*, and many others.

Amongst notable English collections have been those of Baron Schroeder at Egham in Surrey, and Sir Trevor Lawrence at Dorking, each of which must have cost its owner from £30,000 to £40,000 to bring together. Among large commercial collections are those of Veitch, Williams, Low, and Bull, all of London, Sander & Co. at St Albans, and in Scotland of Messrs Thomson at Clovenfords. Sales by auction, at which orchids to the value of thousands of pounds may change hands, take place frequently in London, which is the centre for the world of the trade in orchids. The prices of individual plants vary from 3s. 6d. to hundreds of pounds, the prices depending on qualities of size, form, colour of flower regulated by canons appreciable only by connoisseurs. Baron Schroeder sold a unique plant of *Cypripedium Stonei*, var. *Platyloemium*, for £365; another connoisseur paid £340 for a variety of *Aerides Lawrenceæ*. The ordinary form of the latter may be obtained for about two guineas per plant, and that of the preceding species for half a guinea each, simply because they are more or less plentiful, while rare or unique forms command hundreds of pounds sterling. These unique forms make their appearance very generally without any exercise of skill on the part of the fortunate possessor. They may be bought along

with ordinary or typical varieties of the species to which they belong, and not having been seen in flower by the dealer, their intrinsic value is not known to him. Thus *Cattleya Thomsonii* originated in part of an importation of *Cattleya Mossiae* and other species received from South America. Only one small plant appeared in a numerous batch of plants, with the unique characteristics of the one in question, which was readily bought for £200.

The cultivation of orchids is accounted a difficult branch of the gardener's art. When the value of a considerable collection of rare kinds is considered, their successful management is at least a responsible undertaking. To be successful in their treatment the cultivator should above all things be well informed regarding the conditions under which each species grows in its native habitat. The prevailing temperature and other atmospheric conditions during the periods of growth and of rest, and the amount of shade or of light to which they are exposed at those seasons, must be known to and comprehended by the cultivator before he can adapt his means to the end in view. Houses or compartments of houses are set apart for the accommodation of species which are natives of the more hot and humid parts of the world, such as tropical East India, Madagascar, and Brazil, and a similar arrangement is made for those from Mexico and Central America. The management of the atmosphere of these houses is then based on such knowledge as the cultivator possesses regarding the temperature and moisture, light and shade, that prevail in the countries the several species are natives of. The plants of truly epiphytal habit are usually cultivated on blocks of oak, teak, or other timber, with or without moss about their roots for the retention of moisture. All classes are also grown in pots or lattice-baskets, in rough fibrous peat and Sphagnum moss largely intermixed with charcoal and porous crocks, to secure abundant drainage.

Fig. 5.—*Oncidium Kramerianum*.

Only the terrestrial species are grown in soil proper, and as there are exceedingly few of such that require the accommodation of special houses, space need not here be taken up with their requirements. The propagation of orchids is effected by division of the root-stocks, by separating the pseudo-bulbs in some cases, by cuttings in the case of *Dendrobiums*, and some others with similar forms of growth, and by seed in all cases when it can be obtained, which rarely occurs with cultivated plants except they have been artificially fertilised. Increased interest in orchids has in recent years been evoked by the success that has attended the efforts of hybridists to unite the desirable features of the flowers of any two species in one form. The pioneer in this branch of orchid culture was Mr Dominy of London, whose first success occurred about the year 1860. Many hybrid orchids are now in cultivation, but they all belong to very few genera; certain species of *Calanthe*, *Cattleya*, *Cypripedium*, *Dendrobium*, and *Epidendrum* being all that have yet yielded to the hybridist's art.

Few orchids yield products useful to man. Of these the *Vanilla* (q.v.) is perhaps the best known in commerce. The leaves of *Angraecum fragrans*, a native of the Mauritius, where it is called *Fahum*, and by the French *Isle of Bourbon Tea*, are delightfully fragrant, having the odour of Tonquin bean

with the flavour of bitter almonds, and are said in infusion to promote digestion, and to allay coughs, diseases of the chest, and spasms. The roots of *Helleborine* (*Epipactis latifolia*), a British species, are said to allay arthritic pains. Those of *Himantoglossum hircinum*, *Spiranthes autumnalis*, and *Platanthera bifolia* are reputed to be aphrodisiac. The flowers of *Gymnadenia conopsea*, a native of Britain, have been administered in dysentery. In North America the tubers of *Arethusa* are used to stimulate indolent tumours and to allay toothache. The roots of *Spiranthes diuretica* are much esteemed as a diuretic in Chili. The rhizomes of *Cypripedium pubescens* and of *C. parviflorum* are regarded by American practitioners as an excellent substitute for Valerian as a gentle stimulant. The tubers of *Aplectrum hyemale* are so viscid that they are called Putty-root in the United States, and are there used for cementing broken earthenware.

See Sander's *Reichenbachia*; Veitch's *Manual of Orchids*; *The Amateur's Orchid Guide*, by Britten and Gower; and Watson, *Orchids: their Culture and Management* (1890).

ORCHIS is a genus of Orchidæ, to which, as now restricted, ten of the British species are referred. Some of them are among the most common of British Orchidæ, adorning meadows and pastures with their flowers in summer. It is a rather numerous genus, chiefly spread over Europe, northern Asia, and a very few of the species belong to North America. The British species have mostly red or lilac flowers, sometimes white or green, and often beautifully mottled. The roots of some of the species when dried constitute the salep of commerce, which reduced to a fine powder, and mixed with boiling water, sugar, and milk, makes an excellent diet drink. *O. mascula* and other British species yield such an excellent fecula that it has been suggested the production of salep might be made a profitable industry in England. The accompanying figure gives an idea of the general features of the genus.

Orchis mascula:
a. the lip of the perianth.

Orchil. See ARCHIL.

Orchom'enos, an ancient city of Bœotia, the capital of the kingdom of the Minyæ, was situated at the north-western corner of Lake Copais, where it is joined by the Cephissus, and extended from the marshy edges of the lake up the face of a steep rocky hill, on which stood the acropolis. It sent thirty ships to the Trojan war, and at a later date became a member of the Bœotian confederacy. Its government was thoroughly aristocratic, and after the Peloponnesian war the jealous democratic Thebans destroyed it by fire, and sold its inhabitants as slaves. It was rebuilt in the reign of Philip of Macedon, but never recovered its position. It was famous for its musical festival in honour of

the Graces, who were specially worshipped in the city. In 1880 Schliemann excavated there an old 'treasury,' or rather royal tomb or mausoleum, still larger than that at Mycenæ (q.v.). See O. Müller, *Orchomenos und die Minger* (1844), and Schliemann, *Orchomenos* (1881).—There was a second Orchomenos in Arcadia, lying NNW. of Mantinea.

Orcin, or ORCINAL, $C_6H_3(CH_3)(OH)_2$. This substance is found in the free state in the lichens from which Archil and Litmus (q.v.) are prepared. It is formed when the acids which occur in these plants are boiled with baryta water or submitted to dry distillation. It is also prepared artificially from the nitro-derivatives of the hydrocarbon toluene. As shown by the formula, orcin is a di-acid phenol, and appears in large colourless crystals which turn a reddish-brown colour when exposed to the air. By the action of ammonia and the oxygen of the air it is converted into orcein, $C_7H_7NO_3$, which is the colouring matter of archil.

Ordeal (A.S. *ordél*, *ordál*, the prefix *or-* meaning 'out,' and *dél*, *dál*, 'a dealing,' cognates are the Dutch *oordeel*, and Ger. *Urtheil*, 'judgment'), a practice which has prevailed largely among various widely-separated nations, of referring disputed questions, particularly such as relate to the guilt or innocence of an individual, to the judgment of God, determined either by lot or by the success of certain experiments. And there need be no doubt that it is often successful in the detection of a criminal whose trepidation before the dreaded ordeal betrays him, conscious of his guilt, and more than half afraid of the occult influences he is about to outrage. Of its existence among the ancient Jews we have an instance in Numbers v., where a Hebrew woman, accused of adultery, is required to drink the waters of jealousy as a test of innocence; a similar ordeal for incontinence is still in use among the natives of the Gold Coast of Africa. Compurgation of accused persons by fire, as existing among the Greeks, is referred to in the *Antigone* of Sophocles. Among the Hindus the ordeal has been in use to be practised in nine different ways—by the *balance*, by *fire*, by *water*, by *poison*, by the *cosha* or drinking water in which images of the sun and other deities had been washed, by *chewing-rice*, by *hot oil*, by *red-hot iron*, and by drawing two images out of a jar into which they have been thrown.

Livingstone describes the practice of ordeal as common among all the negro races north of the Zambesi. 'When a man suspects that any of his wives have bewitched him he sends for the witch-doctor, and all the wives go forth into the field, and remain fasting till that person has made an infusion of the plant (called *gono*). They all drink it, each one holding up her hand to heaven in attestation of her innocence. Those who vomit it are considered innocent, while those whom it purges are pronounced guilty, and put to death by burning. The innocent return to their homes and slaughter a cock as a thank-offering to their guardian spirits.' The women themselves eagerly desire the test on the slightest provocation; each is conscious of her own innocence, and has the fullest faith in the *muavi* ('the ordeal') clearing all but the guilty. There are varieties of procedure among the different tribes. The Barotse pour the medicine down the throat of a cock or dog, and judge of the innocence or guilt of the person accused by the vomiting or purging of the animal. The Calabar Bean (q.v.) is also used for the purposes of the ordeal.

Throughout Europe in the dark ages the ordeal existed under the sanction of law and of the church, and was closely related to the oath. The most prevalent kinds of ordeal were those of *fire*, *water*,

and the *wager of battle*. *Fire ordeal* was only allowed to persons of high rank. The accused had to carry a piece of red-hot iron for some distance in his hand, or to walk nine feet barefoot and blindfolded over red-hot ploughshares. The hand or foot was bound up and inspected three days afterwards; if the accused had escaped unhurt he was pronounced innocent; if otherwise, guilty. Under such a judicial system there were probably few acquittals; but there can be little doubt that in the severer kinds of ordeal precautions were taken by the clergy to protect those whom they wished to clear from suspicion. And the feats of modern jugglers suggest possibilities of official trickery which may at once have saved the credit of the ordeal and cleared those meant to be acquitted. Queen Emma, mother of Edward the Confessor, when suspected of a criminal intrigue with Alwyn, Bishop of Winchester, triumphantly vindicated her character by walking unhurt over red-hot ploughshares. *Water ordeal* was the usual mode of trial allowed to bondsmen and rustics, and was of two kinds—the ordeal of *boiling water* and of *cold water*. The ordeal of *boiling water*, according to the laws of Athelstan, consisted of taking a stone out of boiling water, where the hand had to be inserted as deep as the wrist; what was called the triple ordeal deepened the water to the elbow. The person allowed the ordeal of *cold water*—the usual mode of trial for witchcraft—was flung into a river or pond; if he floated without any appearance of swimming he was judged guilty; while if he sank he was acquitted. The *wager of battle* was a natural accompaniment of a state of society which allowed men to take the law into their own hands. The defeated party, if he craved his life, was allowed to live as a 'recreant,' that is, on retracting the perjury which he had sworn to.

Other kinds of ordeal were practised in particular circumstances in different parts of Europe. In the ordeal of the *bier*, a suspected murderer was required to touch the body of the murdered man, and pronounced guilty if the blood flowed from his wounds. Undoubtedly this touched a primitive time, when death was not fully understood, and the lifeless body was supposed still capable of thought and action. And to this day English peasants expect every one who sees a corpse to touch it to show that he bears the dead no ill-will. The ordeal of the *eucharist* was in use among the clergy: the accused party took the sacrament in attestation of innocence, it being believed that, if guilty, he would be immediately visited with divine punishment for the sacrilege. A somewhat similar ordeal was that of the *corsead*, or consecrated bread and cheese: if the accused swallowed it freely he was pronounced innocent; if it stuck in his throat he was presumed to be guilty. Godwin, Earl of Kent, in the reign of Edward the Confessor, when accused of the murder of the king's brother, is said to have appealed to the ordeal of the *corsead*, and been choked by it. There can be no doubt that the popular English asseveration 'May this bit choke me if I lie!' is a distinct survival. An early form of ordeal, abolished by Louis le Debonnaire in 816, was that of the *cross*: the accuser and accused stood upright before a cross, and he who first fell, or shifted his position, was pronounced guilty. It was done away with as being irreverent towards the mystery of the cross. Besides these, there was the ordeal by *lot*, dependent on the throw of a pair of dice, one marked with a cross, the other plain.

Trial by ordeal at first carried with it the sanction of the priests as well as of the civil power, though the clergy in the course of time came to discountenance it. In England it seems to have been continued till the middle of the 13th century.

On the Continent it was, generally speaking, abolished rather earlier, although as late as 1498 we find the truth of Savonarola's doctrine put to the test by a challenge between one of his disciples and a Franciscan friar to walk through a burning pile. In Scotland in 1180 we find David I. enacting, in one of the assemblies of the frank tenantry of the kingdom, which were the germ of parliaments, that no one was to hold an ordinary court of justice, or a court of ordeal, whether of battle, iron, or water, except in presence of the sheriff or one of his sergeants; though, if that official failed to attend after being duly summoned, the court might be held in his absence. The first step towards the abolition of this form of trial in Saxon and Celtic countries seems to have been the substitution of compurgation by witnesses for compurgation by ordeal. The near relatives of an accused party were expected to come forward to swear to his innocence. The number of compurgators varied according to the importance of the case; and judgment went against the party whose kin refused to come forward, or who failed to obtain the necessary number of compurgators. To repel an accusation it was often held necessary to have double the number of compurgators who supported it, till at length the most numerous body of compurgators carried the day.

See the articles *BATTLE* (WAGER OF), *DIVINATION*, and *MAGIC*; also the works of Bastian, Grimm, Tylor, and Waits *passim*; Tylor's article, 'Ordeals and Oaths,' in *Macmillan's Magazine* for 1876; H. C. Lea's *Superstition and Force* (Phila. 1866; new ed. 1878); and George Neilson's *Trial by Combat* (1890).

Order, in Natural History, a group inferior to *class* and *sub-class*, but superior to *family*, *genus*, &c. The term *NATURAL ORDER* is used in Botany to express genuine relationship in contrast to purely artificial grouping, but all orders now recognised are supposed to be more or less 'natural.' See *GENUS*, *SPECIES*.

Ordericus Vitalis, a mediæval historian, born at Atcham near Shrewsbury in 1075. He was the son of Odeler of Orleans, who in Roger de Montgomery's train had accompanied the Conqueror to England, and from childhood was dedicated to God. At ten he was sent to Normandy to be educated for the monastic life in the abbey of St Evroul. Here he spent all his life, although he made several visits to England to collect historical materials. He became a priest in 1107, and died most probably about 1143. Between the years 1130 and 1141 Orderic compiled his *Historia Ecclesiastica*, an elaborate work on the history of Normandy and England, preceded by a brief chronicle of events from the birth of Christ down to his own time. The work is a singular mixture of important history and trivial gossip, marred by absolute lack of order, grotesque style, and laboured grandiloquence; but its writer possessed the seeing eye and the sympathetic heart, and the result is that his confused book remains a precious storehouse to the historian, abounding in those truthful photographic glimpses of reality which are beyond the reach of all the laborious erudition of a later age. With the Conquest it becomes of great value as an honest and trustworthy contemporary source.

The first edition of the *Historia Ecclesiastica* was published by Duchesne, in his *Hist. Norm. Scrip.* (1619). It has also been printed by the French Historical Society (1840), and was translated into English by T. Forester (4 vols. 1853-56) in Bohn's *Antiquarian Library*. The best edition is that by A. le Prevost (5 vols. Paris, 1838-55). See chap. vi. of Dean Church's *St Anselm* (1870).

Orderlies are non-commissioned officers or soldiers employed as messengers or attendants. Thus, in the British army, each general or com-

manding officer has an orderly always at his disposal; a *Post-office Orderly* fetches the letters of each corps; and when a court-martial or board of officers is convened, a non-commissioned officer is appointed as *Court-orderly* to attend upon it. The men of the medical staff corps, when on duty with the sick, are also called *Hospital-orderlies*. The *Orderly-officer* is the officer on duty for the day in each corps. He attends all parades, inspects rations, visits the barrack-rooms at the dinner-hour, hospital, cells, guardroom, &c., remaining in uniform and on duty in barracks the whole day. Similarly, an *Orderly Non-commissioned Officer* of each corps is on duty for the week, calls the roll, warns men for parade, copies orders, &c. The regimental *Orderly-room* is the office where the lieutenant-colonel, assisted by the adjutant and a staff of clerks, transacts his business and sees prisoners daily. Each troop, battery, or company has a similar *Orderly-room* for the use of its commander. The *Orderly-book* or *Order-book* contains the general or regimental orders, which are copied into it as they are issued.

Orders, HOLY, an institution, regarded in the Greek and Roman churches as a sacrament, by which ministers are specially set apart for the service of religion. While some of the reformed churches altogether deny the distinction of ranks in the ministry, none of them admits more than three ranks, of bishop, priest, and deacon. But in the Roman and Greek churches a distinction is made between the major or holy orders and the minor orders. The major orders are those of bishop, priest, and deacon (see the articles under those heads). A fourth rank of sub-deacons is generally regarded as one of the major orders, but its functions closely resemble in their nature and their degree those of the deacon. Some theologians, it should be noted, regard the episcopate not as a separate order, but as the completion and extension of the priesthood. The minor orders in the Roman Church are four in number—those of door-keeper, reader, exorcist, and acolyte. To none of these orders is any vow of celibacy annexed. Some of their functions had their origin in the peculiar religious condition of the early church. Preparatory to the receiving of these orders candidates are initiated in the *Tonsure* (q.v.). In the Roman Church the sacrament of holy orders is held to produce an indelible character, and therefore to be incapable of being forfeited and of being validly repeated. The Greek Church has also the distinction of major and minor orders; but all the functions of the four minor orders of the Roman Church are united by the Greeks in one single order, that of reader (*anagnostēs*).

In the Anglican and other Reformed Episcopal churches the three higher orders of bishop, priest, and deacon are alone retained. An Anglican clergyman may be deprived of his benefice, or suspended by his bishop for various ecclesiastical offences. But, in the usual case of deprivation, the clergyman does not forfeit his status of priest or deacon, which can only be lost by deposition or *degradation*. A bishop may be deprived of his see by his metropolitan, with or without the co-operation of a synod of the bishops of the province, but it has been questioned whether he can be lawfully deprived of his orders as bishop. Till 1870 a clergyman of the Church of England could not become a member of the House of Commons (see *CLERGY*). In the Presbyterian and other non-episcopal churches the ceremony of ordination is not held to impart any indelible character. A minister found guilty of heresy or immorality is deprived of his office by *deposition*, by which his clerical status is forfeited. A minister deposed ceases altogether to be a minister, and is no more capable of any of the

functions of the office than if he had never been ordained. There is nothing to prevent a minister of the Church of Scotland, or any Presbyterian or Independent church, from being a member of the British House of Commons.

The use of a ceremonial for ordination is traceable among the Jews, and the New Testament contains frequent reference to the specific ceremonial of 'laying on of hands' (Acts, vi. 1-7, xiii. 1-4, xiv. 23; 1 Tim. iv. 14, v. 22; 2 Tim. i. 6). In the Roman, the Greek, and the other eastern churches this rite of ordination is held to be sacramental, and it is reserved, at least as regards the major orders, exclusively to bishops. In extraordinary cases it was permitted to cardinals and to certain abbots to confer the minor orders. Considerable controversy exists among Catholic writers as to what are the essential portions (*Materia Sacramenti*) of the rite of ordination. Some place it in the 'imposition of hands,' some in the 'presentation of the instruments' symbolical of each order. As regards the *validity* of the rite of ordination, the mere fact of its being conferred by a bishop suffices; but there is not any part of the Roman discipline which is more jealously guarded by laws than the administration of orders. The candidate can only be *lawfully* ordained by 'his own bishop' (*proprius episcopus*), or with the authority of his own bishop, who is 'his own' in respect of birth, of domicile, of benefice, or of connection by personal service.

In the Church of England and other Reformed Episcopal churches the rules of the ancient canon-law are retained, by which no one could be ordained without previous examination of his fitness, or who was disqualified by bodily infirmity, illegitimacy, immorality, or simony, or who was unprovided with a title (i.e. an appointment to serve in some church) which should provide him with a maintenance; or who, being a candidate for deacon's orders, was under twenty, and for priest's, under twenty-four years of age; but the age for admission to deacon's orders is changed to twenty-three.

In other Reformed churches ordination is performed by the presbytery by imposition of hands, or by one or more ordinary ministers. Some smaller Protestant denominations have no ceremony of ordination whatever.

Orders in Council, orders by the sovereign with the advice of the Privy-council. The Privy-council of Great Britain has no power to legislate, except so far as authorised to do so by parliament; but in periods of emergency it has nevertheless occasionally issued and enforced orders of a legislative kind; those who were concerned in passing, promulgating, or enforcing the orders trusting to parliamentary protection, and taking on themselves the personal responsibility of the proceeding. In such cases an act of indemnity afterwards passed has relieved from liability those who advised the order or acted under it, and given compensation to all who suffered by its enforcement. This course was adopted in 1766 with regard to an embargo on the exportation of corn, issued in consequence of a deficient harvest and prospect of famine. An important constitutional question was raised by the famous Orders in Council issued by Great Britain in 1807 and 1809, in reprisal for Napoleon's Berlin and Milan decrees. See CONTINENTAL SYSTEM.

Orders of Knighthood or Chivalry, with their respective statutes and insignia, seem to have been the result of the desire to institute a superior class among those who devoted themselves to arms, and may be said to have originated between the age of Charlemagne and that of the Crusades; though the Romans, in their equestrian order going

back to the 6th century B.C., and many other of the ancient nations, had similar distinctions. Their nature, and their connection with the religious orders will be found explained in the article KNIGHTHOOD; here we need only give a brief list of the existing orders which either have survived the invention of gunpowder, to become, generally, marks of favour from the sovereign, who in almost all the orders is grand master, or which have been instituted since, to reward military or civil service or mark personal favour.

AUSTRO-HUNGARY.—The *Order of the Golden Fleece* (1429), second only in rank to the 'Garter,' will be found described at GOLDEN FLEECE.—*St Stephen*, instituted by Empress Maria Theresa in 1764, originally as the national order of Hungary. It consists of the grand master (the sovereign of Hungary), twenty grand-cross knights, thirty commanders, and fifty knights. Badge, cross pattée with gold edges. Ribbon, crimson with two green stripes.—*Leopold*, founded by Francis I., 1808, for 'personal' merit.—*Elizabeth-Theresa*, the second military order of the empire, founded by Empress Elizabeth Christina, 1750.—*Maria-Theresa*, founded by Empress Maria Theresa in 1757 for 'officers distinguished in war.'—*Iron Crown*, originally founded to commemorate the crowning of Napoleon I. as king of Italy in 1805, but revived by Francis I. in 1816, and then named the *Austrian Order of the Iron Crown*. It is given for personal merit only. The present badge is the Austrian eagle in gold, &c., rising from the iron crown and pendant from the imperial crown.—*Order of the Community of Noble Ladies of the Starry Cross*, an order for ladies instituted by the Empress Eleanor in 1668 to commemorate the miraculous preservation of a portion of the true cross. It is restricted to high-born ladies.—*The Teutonic Order*, of very ancient but uncertain origin, conferred on Roman Catholic noblemen and ladies who contribute to its ambulance fund.—*Francis Joseph*, instituted by that emperor in 1849 for distinguished merit in all classes.

BAVARIA has several ancient orders. *St Hubert* was founded by Gerhard V., Count of Ravensberg, to commemorate his victory over Arnold, Count of Egmont, in 1444. It is the highest in the kingdom, and is confined to members of the Bavarian Royal House and foreign sovereigns, princes, and barons. Badge, a gold Maltese cross, guttée, &c., surmounted by the Bavarian crown; ribbon, red, watered, with narrow green borders.—*St George*, originally introduced from the Holy Land in the 12th century, revived by Maximilian I. in 1494, but recognised as instituted by the Elector Charles Albert in 1729. It is only given to Roman Catholics and those having no other order.—*Maximilian Joseph*, a military order founded by the Elector Charles Theodore (1794), was raised to be a royal order in 1806 by Maximilian Joseph. It has three classes, and the commoner becomes ennobled by entering it.—*Barbarian Crown*, for civil merit, instituted by Maximilian Joseph in 1808; also confers nobility.—*St Michael*, an order for civil merit without distinction of rank or religion, founded by Joseph Clemens, Duke of Bavaria, in 1693.—*The Maximilian Order*, for art and science, founded in 1853 by Maximilian II. for Germans only.—*Order of Military Merit* (1866).—*Royal Louis Order* (1827).—*Order of Elizabeth*, for ladies of Roman Catholic religion, founded by Elizabeth Augusta (1766).—*St Anne* (1783), for ladies of the nobility, all of its members receiving pensions.—*Theresa* (1827), for unmarried noble ladies.

BELGIUM.—*Order of Leopold*, civil and military, founded by Leopold I. (1832). It has five classes, of which the three inferior have pensions.—*Iron Cross*, for civil merit, founded by Leopold II. (1867).

BULGARIA.—*The Military Order*, instituted by Prince Alexander I. in 1879.

CHINA.—*The Order of the Imperial Dragon* was instituted in 1862 to reward foreigners who had done service to the empire, founded partly on the model of the British order of the Bath. The first foreigner decorated was Colonel (General) Gordon. It was put on a more permanent footing in 1882, and called the *Order of the Double Dragon*. It has five subdivided grades, most carefully specified, ranging from 'sovereigns' to 'commercial classes,' which are distinguished by different kinds of 'pearls' or hemispherical stones. It is this peculiar method of Chinese distinction which is irreverently termed 'buttons' by foreigners.

DENMARK.—The *Order of the Elephant* claims to be as old as the First Crusade, but Christian V. in 1693 altered its statutes and gave it its present title. It is rarely given, and is valued in consequence, and has only one class of thirty knights, exclusive of princes of the blood. Badge, a white elephant with golden tusks, &c. Ribbon, watered, light blue.—*Order of the Dannebrog* was said to have been instituted by Waldemar II. in 1219, to commemorate a miraculous intervention in a battle, but also renovated by Christian V. in 1693, and altered from a court honour to an order of merit by Frederick VI. in 1808. It has five classes. Badge, an oblong Danish cross, enamelled white with red border. Ribbon, white with two red edges.

FRANCE has allowed all its old chivalric orders to lapse, and has now only the *Legion of Honour* (q.v.), which has the advantage of being adapted to any form of government.

GERMANY. See the sections on Prussia, Bavaria, Saxony, and Württemberg.—Many of the minor German states also have orders, the principal of which are the following: Anhalt, *Albert the Bear* (1807, but claiming to date from about 1382).—Baden, *Order of Loyalty* (1715), for princes and 'excellencies'; *Charles Frederick*, military (1807); *Lion of Zähringen* (1812).—Brunswick, *Henry the Lion* (1834), military, civil, and science and art.—Hesse, *Louis* (1807), civil and military; *House of Philippe le Bon* (1840), merit; *Military Merit*, (1870); *Golden Lion* (1770, revised 1870); *Military Sanitary Cross* (1870), for those, irrespective of rank or sex, who succour sick or wounded soldiers.—Mecklenburg, *Crown of the Wendes* (1864)—it has five classes, the highest open to ladies of exalted rank, ninety-six members being apportioned to Schwerin and thirty-two to Strelitz; *Cross of Military Merit* (1814).—Oldenburg, *Order of Merit and of the Ducal House of Peter Frederick Louis* (1838), open to all distinguished in science, art, and domestic virtues.—Saxe-Gotha and Altenburg, *Order of Saint Ernest* (1825), ennobles its holders.—Saxe-Weimar Eisenach, *White Falcon* (1732, remodelled 1815), for 'twenty-four exalted personages in the civil or military service,' &c.

GREAT BRITAIN.—The *Most Noble Order of the Garter*, which stands pre-eminent amongst the orders of knighthood, will be found described at GARTER.—*Orders of the Thistle* (Scotland), *St Patrick* (Ireland), *Bath*, and *St Michael and St George* are all described under their respective titles. For the *Orders of the Star of India*, *Indian Empire*, and *Crown of India*, see INDIAN ORDERS.—*Order of Victoria and Albert*, instituted in 1862 by Queen Victoria for ladies. Badge, the heads of the Empress-Queen and Prince Consort, surmounted by the imperial crown.—*Military Order*, and *Order of Merit of British India*, instituted in 1837 to reward meritorious services in the native army of India, by native and European officers. Badge, gold star of eight clusters of rays, surmounted by the imperial crown.—*Order of Merit*, also for India, instituted in 1837 to reward personal bravery irrespective of rank. Badge, eight-pointed star, in centre two cross swords, on a wreath 'Reward of Valour.'—The *Distinguished Service Order* (1886), 'for rewarding individual instances of meritorious and distinguished services in war.'

GREECE.—*Order of the Redeemer*, founded by King Otho in 1833 to commemorate the deliverance of Greece. Conferred for distinction of all kinds.

ITALY.—*Order of the Annunziata*, the third in rank of all orders, claims to have been founded in 1362 by Amadeus VI., Count of Savoy. It was revived by Charles III. in 1518, and was finally modified by Victor Emmanuel II. in 1869, who restricted the knights to twenty, exclusive of the sovereign, foreign princes, and certain others. Badge, a gold medallion representing the holy annunciation, surrounded by interlaced love-knots.—*St Maurice and St Lazarus*, formed by the union of two distinct orders, the first dating from the 15th century, and the latter claiming to have been in existence in Jerusalem in 1000. After many changes it was decreed new statutes by Victor Emmanuel II., who made the number of knights unlimited.—*Military Order of Savoy*, instituted by Victor Emmanuel I. in 1815, altered by Victor Emmanuel II. in 1855. It has four classes.—*Civil Order of Savoy*, instituted by King Charles Albert in 1831, limited to sixty knights 'who have contributed to the service of the king and the welfare of the state.'—The *Crown of Italy*, instituted by Victor Emmanuel II. in

1868 to commemorate the annexation of Venetia. The number of knights is practically unlimited.—*Order of the Chivalry of San Marino* was instituted by the grand council of the Republic in 1859.

JAPAN possesses two orders—*The Eastern Sun*, for civil and military merit, instituted in 1874; and the *Order of the Chrysanthemum* (1876), which the Mikado himself wears. It is mostly conferred on princes of the blood and foreign sovereigns, the first foreigner to receive it being Czar Alexander II. of Russia. Badge, a yellow enamel chrysanthemum variously ornamented.

LUXEMBOURG has one order, the *Oaken Crown*, instituted for all classes by William II. of the Netherlands in 1841.

MONACO has the *Order of St Charles* (1858).

MONTENEGRO has two orders—*Danilo the First* (1852), for civil merit; and *St Peter* (1852), for members of the reigning house exclusively.

NETHERLANDS.—The *Order of William*, founded by William I. in 1815, is to reward conspicuous military gallantry; and the *Order of the Netherlands Lion* (1815) rewards civil merit. There is also the *Order of the Golden Lion* (1858) as a family order of the House of Nassau.

PERSIA.—The *Order of the Sun and Lion*, instituted in 1808; and the *Order of the Sun* (1873), for ladies.

PONTIFICAL.—The *Order of St Gregory the Great* was established by Pope Gregory XVI. in 1831 as a reward for zeal in the cause of the Roman Catholic religion.—The *Order of Christ*, dating from 1319, is similar to the Portuguese order of the same name, except that noble birth is not indispensable to admission.—The *Order of St Sylvester* claims a very early foundation, but seems to have really originated in 1559. Gregory XVI. in 1841 restricted its application to zeal in the cause of the church and civil virtues. The *Order of Pius* was founded in 1847 by Pius IX., and confers nobility. The *Order of the Holy Sepulchre* claims to date from 1099, and was confirmed by Benedict XIV. in 1746. Pius IX. added new statutes in 1868.—The *Order of St Cecilia* was founded in 1847 by Pius IX.—For the *Order of St John of Jerusalem*, see HOSPITALIERS.

PORTUGAL.—The military *Order of St Benedict of Avis* originated in 1143 in a society of noble Portuguese for the purpose of opposing the Moors. It remained a military order until 1789, when Donna Maria converted it into an order of merit of three classes. Badge, a lily cross, enamelled green with gold edges.—*St James of the Sword*, originated in Spain in 1175, but separated from that country shortly afterwards. It was converted into a merit order by Donna Maria.—The military *Order of Christ* was founded on the abolition of the *Order of the Temple* (see TEMPLARS), and is another branch of the Pontifical order of the same name. It is only open to Roman Catholics of noble birth. Badge, red enamelled cross, charged with a plain white cross.—*Order of the Tower and Sword*, for merit, was originated in 1808, but remodelled under its present name in 1832.—*Order of Isabella*, for ladies, was founded in 1801.—The *Order of Our Lady of the Conception of Villa-Viciosa* was founded by John VI. in 1818 for both sexes.

PRUSSIA has no very ancient orders, although the *Order of the Black Eagle* is held in the highest estimation. It was founded in 1701 by the Elector of Brandenburg to commemorate his coronation as king of Prussia (Frederick I.). It is limited to thirty knights (exclusive of princes of the royal blood), who must prove a noble descent for four generations. Badge, a blue enamelled Maltese cross, with a black eagle displayed in each angle; in the centre the royal cipher F.R. with the motto *Suum cuique*.—The *Order of the Red Eagle* was originated in 1705, and was raised to the second rank by Frederick William II. Only those having it can receive the *Black Eagle*. The badge is similar to the Black Eagle, except that the cross is white and the eagle red.—*Order of the Crown* was instituted in 1861 by William I. to commemorate his coronation as king of Prussia. It is for meritorious services in presence of the enemy, and ranks equal to the Red Eagle. Badge, white enamelled gold cross with gold edges, having in the centre the royal crown on a gold field surrounded with a blue fillet inscribed *Gott mit Uns*.—*Order of Military Merit*, converted into an order 'for merit' from an older order by King Frederick II. in 1740.—A new *Royal and Protestant Order of St John of Jerusalem* was founded in 1813 by

Frederick-William III., which received a new constitution from Frederick-William IV. in 1852 (see HOSPITALIERS).—*Order of Civil Merit* in arts and sciences was founded by Frederick-William IV. in honour of the memory of Frederick II.—*Order of Louisa* was founded in 1815 by Frederick-William III. for women's services in war.—*Order of the House of Hohenzollern*, founded in 1851.

ROUMANIA.—The *Order of the Star*, for civil and military merit, instituted by Prince Charles in 1877.—*Order of the Crown of Roumania*, founded in 1881 by the king of Roumania.

RUSSIA, like Prussia, has no very ancient orders, though entry into all of them creates nobility.—The *Order of St Andrew*, the patron saint of Russia, founded in 1698 by Peter the Great, is the highest in the empire. It carries with it the orders of *St Anne*, *Alexander Nevsky*, and *St Stanislaus*. Badge, the Russian double-headed eagle charged with St Andrew on an azure cross, and surmounted by the imperial crown.—*Order of St Catharine*, founded by Peter the Great in honour of his consort Catharine I. in 1714, is now restricted to ladies.—*Order of Alexander Nevsky*, instituted by Catharine I. in 1725 in honour of Alexander, son of Jaraslov, Prince of Novgorod (1240). It is both civil and military, the latter open to no one under the rank of major-general.—*Order of St Anne*, founded in 1735 by Duke Frederick Charles Frederick of Holstein-Gottorp in memory of the Empress Anne, and declared a Russian order in 1796 by Paul III.—*Order of St George*, instituted in 1796 by Catharine II. for officers of the army and navy.—*Order of St Vladimir*, founded by Catharine II. in 1782 as an order of civil and military merit. Among other qualifications, 'whoever, at the peril of his life, saves ten lives from fire or water' may claim it.

The POLISH orders of the *White Eagle*, an old order supposed to date from 1325, 'restored' in 1807, *St Stanislaus*, founded by Stanislaus Augustus Poniatowski in 1765, and *Military Merit*, by Stanislaus Augustus in 1792 and revived at Warsaw in 1807, were in 1831 united with those of Russia.

SAXONY.—The *Order of the Crown of Rue* was founded in 1807 by King Frederick Augustus, at the suggestion of Napoleon I.—*Order of Albert the Valorous*, for merit in science, art, and civil virtue, instituted by King John in 1850.—*Order of St Henry*, for merit on the battlefield, founded by Augustus III., king of Poland and Elector of Saxony in 1739.—*Order of Civil Merit*, founded in 1815 by King Frederick Augustus on his restoration.—*Order of Sidonia*, for ladies, founded in 1870 by King John as a reward for services during war.

SERBIA has three orders: the *Double-headed White Eagle*, founded by Milan I. in 1883 to commemorate the re-establishment of the kingdom, is conferred for services to the king or country.—The *Cross of Takovo*, founded in 1865 by Prince Michael, is for services to the cause of Servian independence.—The *Order of St Sava*, for services to education, literature, or the church, was instituted in 1883.

SIAM.—The *Royal Order of the White Elephant* was instituted in 1861, and consists of five classes. It is the highest of Siamese orders, and was accepted by the Empress-Queen Victoria. Badge, a beautifully enamelled white elephant, surrounded by a triple circle of leaves in yellow, red, and green enamel, and surmounted by the Siamese crown.—The *Order of the Crown*, the second order in Siam, instituted by the king of Siam in 1869.—Other orders are *Chulachondas*; the *Sacred Order*, said to have been instituted in 1782; and the *Order of Maha Chakrakri*, founded by the king of Siam in 1882 in honour of the centenary of his capital.

SOUTH AND CENTRAL AMERICAN STATES.—Brazil, prior to the establishment of a republic in 1890, had four orders—*Order of Pedro* (1827); *Order of the Southern Cross* (1822); *Order of the Rose* (1829), all instituted by Dom Pedro I.; and *Order of St Benedict of Avis*, *St James of the Sword*, and of *Christ*, taken to Brazil when a dependency of Portugal, and proclaimed as 'national' in 1823.—Bolivia and Peru—*Legion of Honour* (1866).—Honduras—*Order of Santa Rosa* (1868).—Nicaragua—*Order of St John of Nicaragua* (1857).—Venezuela—*Order of the Bust of Bolivar* (1825).

SPAIN.—The *Order of Calatrava* was instituted to commemorate the recovery of that town from the Moors in 1147. Convents of nuns were attached to the order in 1219 and in 1479. In 1523 Charles V. vested in the

crown of Spain the grand mastership of the orders of *Calatrava*, *Alcantara*, and *St James*. Badge, on a gold lozenge a red fleur-de-lis cross.—*Order of St James of Compostello*, founded in 1175 in honour of the relics of the patron saint of Spain, believed to be preserved at Compostello. It is now purely military. Badge, a red enamel sword with fleur-de-lis hilt, in an oval white enamel medallion with a red border.—*Order of Alcantara* (q.v.), instituted in 1177 by Pope Alexander III., but the name Alcantara was only assumed in 1213 on their getting possession of that place. Badge, same as Calatrava, but green.—*Order of Our Lady of Montesa*, founded in 1317 by James II. of Aragon and Valencia.—The *Golden Fleece*, identical with the Austrian order of the same name (see GOLDEN FLEECE).—*Order of Charles the Third*, founded by that sovereign in 1771.—*Order of Maria Louisa*, founded by Charles IV. in 1792 for 'noble ladies'.—*Order of St Hermengilde*, founded by Ferdinand VII. in 1814 for officers of the army and navy.—*St Ferdinand*, founded by Ferdinand VII. in 1811 for military exploits, includes a class for subaltern officers and soldiers.—*Isabella the Catholic*, founded by Isabella of Portugal in 1815 for defence of the American possessions.—*Beneficencia*, established by royal decree in 1856 for humane and useful public service.—*Naval Merit*, founded on the 'Marine Cross' of 1816, in 1866.—*Maria Isabella Louisa*, instituted in 1833 to reward the lower ranks of officers in honour of the king's 'august daughter'.—*Military Merit*, founded by Queen Maria Isabella Louisa in 1864.

SWEDEN AND NORWAY.—*Order of the Seraphim*, or *Blue Ribbon*, of doubtful origin, but assigned to King Magnus (1280), revived in 1748 by Frederick I. It has twenty-four Swedish and eight foreign knights, who must not be under rank of lieutenant-general.—*Order of the Sword*, or *Yellow Ribbon*, ascribed to Gustavus Vasa and revived by Frederick I. in 1748.—*Order of the Pole Star*, or *Black Ribbon*, founded in 1748 by Frederick I. for civil merit.—*Order of Vasa*, founded by Gustavus III. on his coronation in 1776 to reward services in developing the natural resources of the country. It has a green ribbon.—*Order of Charles the Thirtieth*, founded by that monarch in 1811 for freemasons of high degree. It has a red ribbon. This is memorable as the only knightly order into which only freemasons are admitted.—*Order of St Olaf*, founded by King Oscar in 1847 in memory of St Olaf, who in 1015 threw off the yoke of Denmark. It is open to the meritorious of all classes. Red ribbon with blue and white borders.

TURKEY.—*Order of the Nishani Medjidi*, established by Sultan Abd-ul-Medjid in 1850 for good conduct in the Turkish service. It has five classes, the first having fifty and the last six thousand members, not including foreigners who may receive it.—*Nishani Osmanie*, instituted in 1862. It has four classes for services to the state, military and civil.—*Nishani Shefakat*, instituted in 1877 for ladies, to commemorate the 'Turkish Compassionate Fund' under the auspices of Baroness Burdett-Coutts.

WÜRTEMBERG.—*Order of the Crown of Würtemberg*, formed in 1818 by the union of an older order with Frederick I.'s *Order of Civil Merit* of 1806. It confers personal nobility on civilians.—*Order of Frederick*, a military order founded by King William in 1818 in honour of his father.—*Order of Military Merit*, instituted in 1759 by Duke Charles Eugène.—*Order of Olga*, for ladies, founded by King Charles X. in 1871 in honour of his queen, Olga, and is bestowed for special service in the field, for both sexes.

In addition there are many minor governments which have orders. Hawaii has three, *Kamehameha* (1865), *Kalakaau* (1874), and *Kapiolani* (date uncertain). Abyssinia, Cambodia, Liberia, Zanzibar, &c. have one each.

A complete account of all the orders, fully illustrated, with a complete bibliography of the subject, will be found in *Orders of Chivalry*, by Major J. H. Lawrence-Archer (Lond. 1887), to which work we are indebted for much of our information. See also Elias Ashmole, *Institution of the Garter and other Military Orders* (1693); Clark's *History of the Orders of Knighthood* (1784); Hansen, *The Orders of Europe* (1802); Carlisle, *Foreign Orders of Knighthood* (1839); Nicholas, *History of British Orders of Knighthood* (1842); Sir Bernard Burke, *Book of the Orders of Knighthood* (1858).

Ordnance Survey. By this term is understood the various operations undertaken by the British government for preparing maps and plans of the whole kingdom and its parts, the term 'ordnance' being applied from the fact that during its earlier days the survey was carried out under the direction of the Master-general of the Ordnance. The idea of a general map of any portion of the country to be executed by the government was first proposed after the rebellion in 1745, when the want of any reliable map of the northern parts of Scotland was much felt by the officers in command of the royal troops. Its execution was entrusted to Lieutenant-general Watson, the deputy quartermaster of North Britain; but it was mostly carried out by Major-general Roy, an officer of engineers. The drawing, on a scale of $1\frac{1}{2}$ inch to the mile, was completed in 1755; but, in consequence of the war which broke out in that year, was never published. In 1784, with the object of calculating the difference of longitude between the observatories of London and Paris, a base-line was measured by General Roy, R.E., on Hounslow Heath, from which started a series of triangles extending to Dover. This triangulation was connected with that carried out in France in 1786. The government shortly afterwards decided on having, for military purposes, a general survey on the 1-inch scale of the United Kingdom, and the triangulation carried out by General Roy in the south-eastern counties became the basis of the general triangulation. In 1794 the survey for the 1-inch map was begun, and the first sheet was published in 1801. As the series of principal triangles were extended westwards towards the Land's End, it was thought right to measure another base on Salisbury Plain in 1794; and two base-lines for verification were subsequently measured—one in 1801 at Misterton Carr, and the other in 1806 on Ruddlan Marsh. Though first intended chiefly as a military map, the publication of the survey soon created a desire on the part of the public for better maps, and surveyors were then hired to hasten its progress. This, however, was very slow, the map being at one time entirely suspended during the war in the beginning of the 19th century, and even the parts which were executed, having been done by contract, were found very inaccurate. In this condition the survey of England continued during the first quarter of the century, sometimes delayed by the government from motives of economy, at other times urged on by the county gentlemen, who wished the map either as a hunting-map or for local improvements.

In Scotland the principal triangulation was begun in 1809, but was discontinued in the following year, to enable the persons who had been employed there to carry forward the subordinate triangulation required for constructing the detail maps in England. In 1813 it was resumed, and continued steadily up to 1819; a new base-line having been measured on Belhelvie Links, near Aberdeen, in 1817, and the great sector used at various stations, both on the mainland and in the islands. In 1820 it was again suspended, was resumed in 1821 and 1822, and anew broken off in 1823, the large theodolite being wanted in order to proceed with the principal triangulation in South Britain. In 1824 the survey of Ireland was begun, and nothing more was done in Scotland

till 1838, except that some detail surveying for a 1-inch map was continued for a few years in the southern counties. The chief strength of the surveying corps was now transferred to Ireland. A map of that country was required for the purpose of making a valuation which should form the basis of certain fiscal arrangements and other improvements which the social evils and anomalies of Ireland urgently demanded. For this map a scale of 6 inches to the mile was adopted, as best suited for the purposes in view. On this scale the whole map was completed, and published in 1845, though the first portions were in an imperfect form, and needing revision, which was proceeded with in 1873.

The triangulation of Scotland was resumed in 1838, and in 1852 the whole of the primary triangulation of the United Kingdom was completed. It comprises, in all, 250 trigonometrical stations, and the average length of the sides of the triangles is 35.4 miles, the longest being that from Scaw Fell to Slieve Donard, which measures 111 miles. During the triangulation of Ireland a base-line had been measured on the border of Lough Foyle. As a test on the general accuracy of the triangulation the length of this base was afterwards calculated through the series of triangles from the base on Salisbury Plain; the length so found differed from the measured base by only a little more than 5 inches. The distance apart of these two bases is about 360 miles, and their length about 41,641 and 36,578 feet respectively.

The survey of Ireland having been finished in 1840, surveys for a 6-inch map were begun for the northern portions of England which had not been previously mapped on the 1-inch scale. In 1841 some secondary operations for a map of Scotland, also on a 6-inch scale, were begun, but proceeded so slowly that in 1850 only the map of Wigtownshire and some parts of Lewis were completed. Much dissatisfaction having been expressed in Scotland by the press and public bodies as to the slow progress of the map and the 6-inch scale on which only it was published, a committee of the House of Commons (Lord Elcho's) recommended in 1851 the 6-inch maps to be stopped, and the 1-inch map completed as speedily as possible. This change produced much discussion as to the relative value of the 1-inch and 6-inch scales then in use, and the expediency of adopting a still larger scale as more valuable to the public. Circulars were issued, asking the opinion of various public bodies, and of scientific and practical men, as to the proper scale for a great national survey. The great preponderance of opinion was in favour of a scale of $\frac{1}{25000}$ of nature, or nearly 1 inch to the acre. This scale was therefore ordered by a treasury minute of 18th May 1855 (Lord Palmerston's), and though subsequently stopped, in consequence of a motion by Sir Denham Norreys in the House of Commons in June 1857, was again recommended by a royal commission (December 1857), and ordered to be resumed by another treasury minute (11th September 1858). In 1861 a select committee was again appointed, and reported that it is desirable that the cadastral survey on the scales directed by the treasury minute of the 18th May 1855 be extended to those portions of the United Kingdom that have been surveyed on the scale of 1 inch to the mile only. This recommendation was presently adopted by the government, and the survey has been completed on the following scales: Towns having 4000 or more inhabitants are surveyed on a scale of $\frac{1}{2500}$ of the linear measurement, which is equivalent to 126.72 inches to a mile, or one inch to 41.3 feet; parishes (in cultivated districts) $\frac{1}{5000}$ of the linear measurement, equal to 25.344 inches to a mile, or one square inch to an acre; counties

on a scale of 6 inches to a mile; kingdom, a general map 1 inch to a mile.

The sheets of the 1-inch map join together, so as to form a complete map of the whole kingdom. This is true also of the sheets on the 6-inch and 25-inch scales of each county, but the sheets of different counties, except when drawn to the same meridian, are not connected. The 25-inch scale also applies only to cultivated, populous, and mineral districts; the Highlands of Scotland, and other extensive moorland and uncultivated tracts, being only surveyed on the 6-inch scale.

The scale, originally 1 inch to a mile, was increased to 6 inches to a mile when the survey reached Yorkshire and Lancashire; these counties being done on that scale as well as on the 1-inch scale. The remaining counties of England were done on the scale of 25 inches to a mile for cultivated districts, and on 6 inches to the mile for the uncultivated and moorland districts. When England was completed a re-survey was begun on the 25-inch scale of those counties which had only been surveyed on the 1-inch scale. The sheets on the scale of 25 inches to a mile (called parish maps) are reduced by photography, and issued on the scale of 6 inches to a mile (county maps). The 1-inch maps are again reduced by photography from the 6-inch, and are being published in outline only and also with hills.—The survey of the whole of Scotland was completed in 1877, and the maps for the whole area, on either the 25-inch or 6-inch scales, have been published. On the 1-inch scale two editions are published, one in outline only and another with hills.—In Ireland, as stated, the 6-inch maps have been long published, and are now in process of revision, and a survey on the 25-inch scale has been commenced. A 1-inch map of the whole in outline, and, with the exception of a few sheets, an edition with hills have been published. In all the three kingdoms plans of many of the towns on the 10 and 5 feet scale are also published.

The sketch now given of the history of this great national undertaking will show that it has been conducted at different times on different scales and plans, and that the system now pursued was only adopted after much discussion both in parliament and out of doors. The map was originally begun as a military map, and the scale of 1 inch to the mile chosen, without considering whether some other scale would not offer greater advantages. Many now think that a scale a little larger, and an aliquot part of nature, such as 25000, or about $1\frac{1}{2}$ inch to the mile, would have been preferable for the small map; in which case a scale of 15000 of nature, or about $6\frac{1}{2}$ inches, might have been chosen for the intermediate, instead of the 6-inch scale selected at first for mere local purposes in Ireland. Be this as it may, the arguments in favour of the 1-inch map are that it is the most convenient both as a general and travelling map. For general views of the structure of a country, the distribution and relations of its mountains, plains, valleys, and rivers, the 1-inch is admitted to be superior to the 6-inch, and thus better adapted in the first instance for laying out roads, railways, or other extensive public works, or for the publication of a general geological survey. Such a map, on the other hand, is on too small a scale to admit of correct measurements of small distances; it is in some respects a generalised picture and not a correct plan. The 6-inch maps were at first selected in Ireland as the smallest size on which correct measurements of distances and areas could be made. On them every house and field, and almost every tree or bush, might be laid down. Hence they are superior for working out details, as in minute surveys of railways or roads,

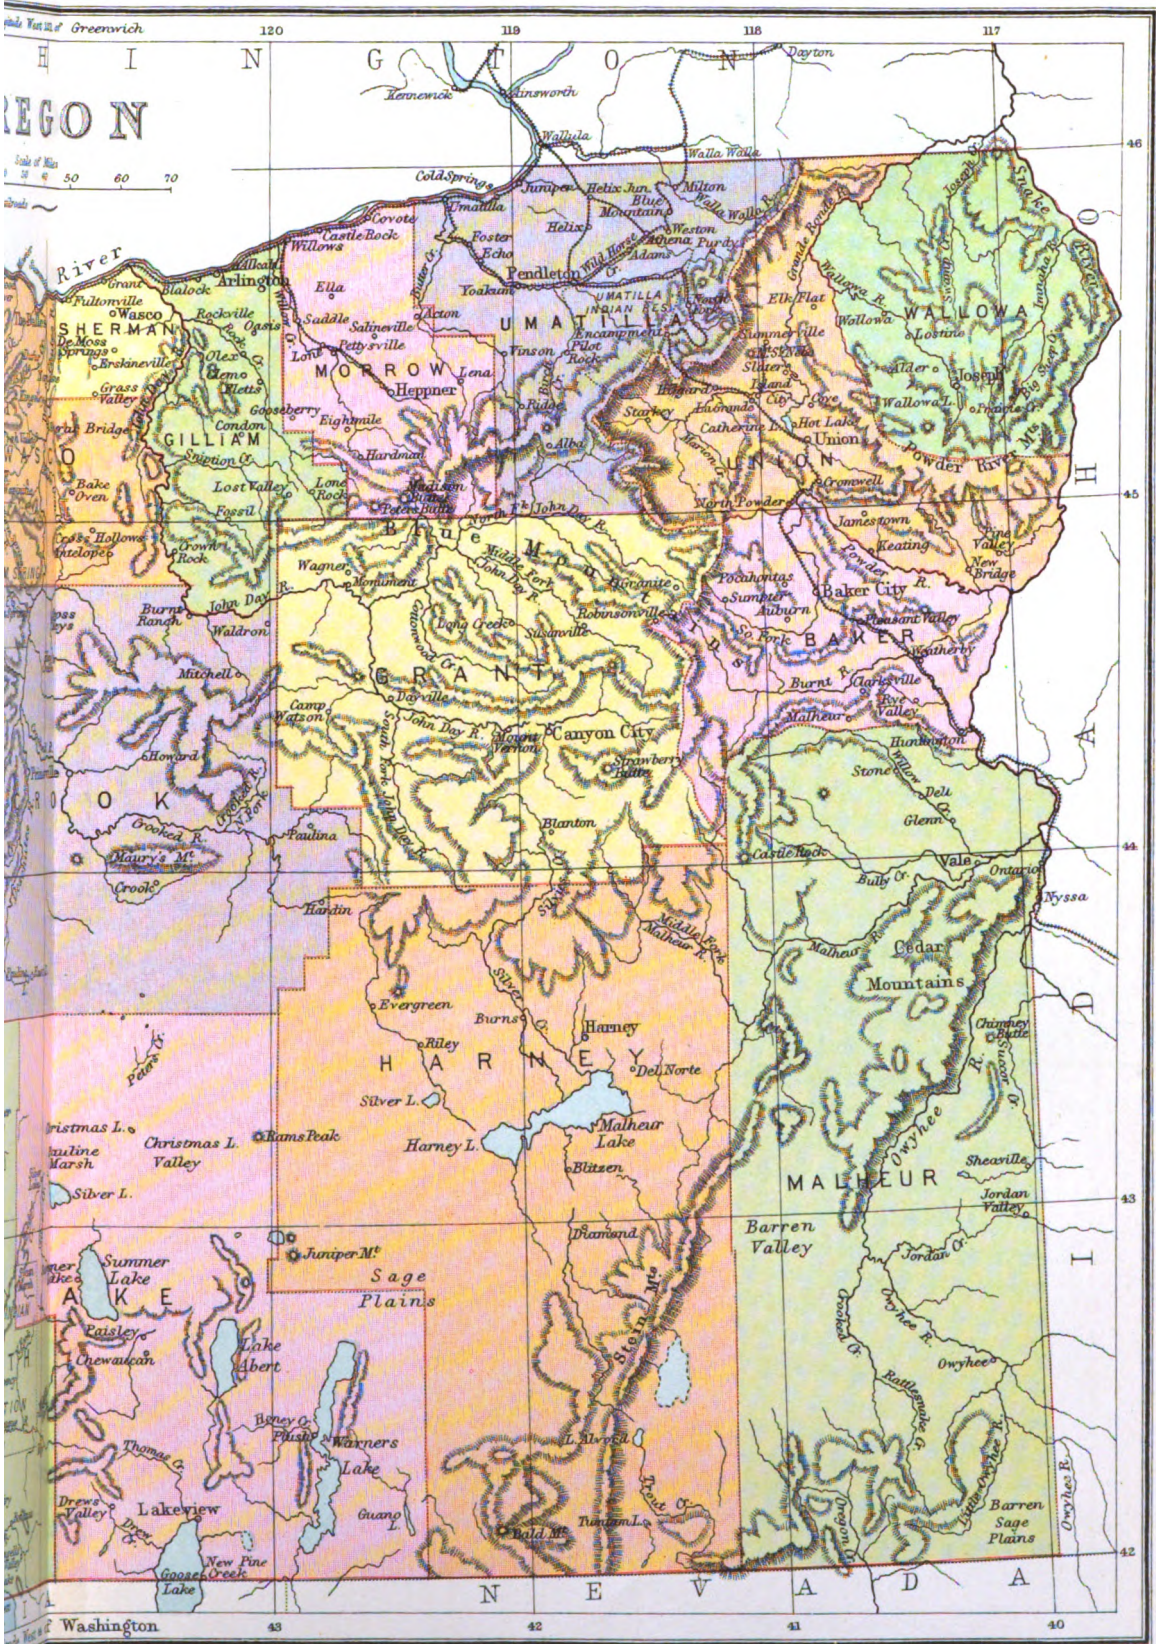

or the complex geological structure of rich mineral districts. On such sheets, too, a proprietor or farmer may find every field laid down, and the relative heights indicated by contour lines, and may therefore use them for drainage and other improvements. It has also been proposed to use these 6-inch maps as a record of sales or encumbrances of land, thus lessening the cost and simplifying the transfer of property. On the other hand, their size unfits them for most of the purposes for which the 1-inch map is useful, and the contour lines give a far less vivid and correct impression of the physical features of a country than the hill sketching of the 1-inch map. Most of the purposes of the 6-inch plans are attained in a still more perfect manner from the 25-inch plans or cadastral survey. This last name is taken from the French *cadastre* ('a register of lands'), and is defined (in the *Recueil des Lois*, &c.) as a plan from which the area of land may be computed, and from which its revenue may be valued. The purposes to which these large plans may be applied are as estate plans, for managing, draining, and otherwise improving land, for facilitating its transfer by registering sales or encumbrances; and as public maps, according to which local or general taxes may be raised, and roads, railways, canals, and other public works laid out and executed. In 1870 the Ordnance Survey was transferred from the control of the War Office to that of the Office of Works, and in 1890 to the newly-instituted Board of Agriculture.

Nearly all civilised states have produced trigonometrical surveys, many of them of great excellence as scientific works. The most important are:

Austria, 1:10000 or 8447 inches to a mile.
Belgium, 1:5000 or 3168 inches to a mile.
Denmark, 1:2500 or 792 inches to a mile.
France, 1:5000 or 792 inches to a mile, and a reduced map, 1:10000 or 1267 inches to a mile.
Germany, 1:5000 or 6336 inches to a mile; also 1:10000 or 2534 inches to a mile.
Italy, 1:5000 or 2534 inches to a mile; also 1:10000 or 6336 inches to a mile.
Netherlands, 1:5000 or 1267 inches to a mile.
Norway and Sweden, 1:5000 or 158 inches to a mile.
Switzerland, 1:5000 or 2584 inches to a mile.
United States, from 1:5000 or 5 inches to a mile, to 1:10000 or 25 inches to a mile.

The Coast and Geodetic Survey of the United States, which was authorised in 1807, but not really begun till 1817, is a work of enormous extent, great accuracy, and minute detail. The full organisation of the survey was mainly due to A. D. Bache (q.v.). The general charts are published on a scale of 1:50000 or $\frac{1}{4}$ ths of an inch to a mile; the harbours and ports 1:25000 or $\frac{3}{8}$ of an inch to a mile. A vastly greater undertaking, the triangulation of the whole area of the republic, has been more recently begun. The great Trigonometrical Survey of India was commenced in 1832; and the year 1880-81 witnessed the completion of the principal triangulation of all India. The maps are published on various scales, those of the Trigonometrical Survey being on a scale of 1:50000, or 25 inches to a mile, whilst maps on both larger and smaller scales are published for revenue and special purposes.

The Geological Survey of the United Kingdom, though under a different department of government (Science and Art), may be shortly noticed here. The English survey, begun in 1832, was completed on the scale of 1 inch to a mile (solid geology), and the Drift survey proceeded with. The Irish survey was begun in 1840, but was subsequently suspended till 1845. It was completed in 1887, and the whole of the maps are now published. In 1854 the survey was extended to Scotland. The southern half of the country has been completed, and the mapping of the Highlands is now in progress. The surveys

are made on the 6-inch maps in the parts of the country where these exist, but the results are published on the 1-inch scale only, except some of the mineral districts, which are issued also on the 6-inch scale. Besides the maps, sheets of sections, horizontal and vertical, with valuable memoirs, and monographs on fossils, are also published; and a general index map, scale 4 miles to an inch, is in progress. A survey of the West Indies has been carried out, and memoirs descriptive of the geology of Trinidad, Jamaica, and British Guiana have been published. The geological survey of Canada and that of India are vast undertakings in progress; also government geological and mining surveys are in progress in the Australian colonies. See the articles CONTOUR LINES, MAP, SURVEYING; Colonel White's *Ordnance Survey of the United Kingdom* (Edin. 1886).

Ordovician, a name sometimes given to a geological formation intermediate between Cambrian and Silurian; otherwise accounted the Lower Silurian strata. It is so called from the Ordovices, an ancient British tribe.

Ore-deposits. Any mineral which is obtained by mining, and which contains a workable proportion of a metal, is called by miners an *ore*. Ores are met with in various forms and positions in the earth's crust. Sometimes they are found in gravel, sand, and other alluvial deposits. Examples of this class are afforded by the placers of California (see GOLD), the now exhausted tin-stream works of Cornwall, and the bog iron ores of various localities. In other cases the ores occur disseminated through igneous and sedimentary rocks. Tin ore and magnetic iron ore are frequently met with in this form. When the whole rock is permeated with mineral matter, accumulated in minute veins, the deposit is termed a *stock-work*. Examples of such deposits of tin ore occur at Carclase and other places in Cornwall, and at Altenberg in Saxony. Again, the ores may occur in detached masses. Such, for instance, are the red hematite deposits of Ulverston in Lancashire, the brown hematite of the Forest of Dean, the iron mountains of Gellivara and Taberg in Sweden, and of Missouri. The ores may occur in regular parallel beds (see MINING) or seams interpolated between rocks of sedimentary origin, as in the case of the ironstone of the coal-measures, and in that of the cupriferous shale of Mansfeld in Prussian Saxony, a seam not more than 5 inches thick which has been worked without interruption since the 12th century. Lastly, ores are met with in tabular masses, known as mineral veins or *lodes*, differing in character from the enclosing rocks. The simplest classification of ore-deposits is that based on their form, into two divisions: (1) tabular deposits, a class subdivided into (a) beds, whether interstratified or superficial, and (b) lodes; and (2) non-tabular deposits, or masses.

A lode is usually defined as a repository of mineral matter which fills more or less completely a former fissure. Though this definition is undoubtedly true in most cases, deposits are occasionally met with in which the rock at the sides of the fissure, having been so altered as to render it worth working, should be considered as part of the lode. These exceptional cases are included in a more general definition propounded by Dr C. Le Neve Foster, who regards lodes as tabular deposits of mineral, which have been formed subsequently to the rocks by which they are surrounded. Lodes are very variable in thickness, from a mere film up to 150 feet or more. Their longitudinal extent is equally variable. The great Mother Lode of California has been traced for a distance of 70 miles.

In tabular deposits, whether beds or lodes, two dimensions predominate, and the third or smallest dimension, the perpendicular distance between the two bounding planes, is termed the thickness. The adjacent rock on both sides of these two planes is termed the *country*; the portion on which the deposit lies is the *foot-wall*, and that covering it is the *hanging-wall*. With beds or seams, these are known as the *floor* or *roof* respectively. The *strike* of a deposit is the angle formed with the meridian by the direction of a horizontal line drawn in the middle plane, and its *dip* is the inclination downwards measured in degrees from the horizontal. As the dip of lodes is usually considerable, it is sometimes measured from the vertical, and is then termed *underlie* or *hade*. The portion of a mineral deposit occurring at the surface is known as the *outcrop*, *basset*, or (in the United States) *apex*. The contents of lodes vary, some parts containing worthless vein-matter or *gangue*, others being filled with ore. The productive portions are termed *courses*, *bunches*, *shoots* (U.S. *chutes*), or *pipes* of ore. Cross-courses are veins with a direction nearly at right angles to the chief lodes of any particular mining district. Experience shows that the productiveness of lodes is affected by intersection with other veins, by the nature of the adjacent rock, and by changes of dip or of strike.

The origin of mineral veins is a much debated subject which has long occupied the attention of geologists. All the theories which have at various times been brought forward assume in the first place that a fissure has been formed in the earth's crust. This fissure has, it is thought, been filled up by mechanical action causing the attrition of the sides, by sublimation, by injection of molten or plastic material from below, as in the case of dykes of eruptive rock, or, lastly, by depositions from solution, coming from above, from below, or from the sides. The last mentioned, known as the lateral secretion theory, has received great support by the researches of Prof. F. Sandberger. These researches have shown the presence of the common heavy metals in rocks belonging to every geological period. Copper, tin, lead, zinc, cobalt, and nickel have been detected in silicates (mica, augite, and olivine), occurring as component minerals of the commonest rocks. Prof. Sandberger therefore concludes that these metals have been dissolved out and deposited in fissures.

The subject of mineral deposits is systematically treated in J. A. Phillips' *Treatise on Ore-deposits* (Lond. 1884), in which a full bibliography of the subject will be found. The reduction of ores is discussed under METALLURGY, and under the names of the several metals.

Oregon, one of the Pacific states of the American Union, is in 42°–46° N. lat. and 116° 40'–124° 45' W. long, and is bounded N. by Washington, E. by Idaho, and S. by California and Nevada. Copyright 1891 in U.S. by J. B. Lippincott Company.

Area, 96,030 sq. m., or almost twice that of England. Oregon on the west is literally rock-bound by the Coast Range of mountains, having, however, numerous indentations which furnish good harbours for sea-going vessels. The Columbia River affords the largest and deepest entrance. Seventy miles east of the Coast Range is the Cascade Range, rising to a height of 6000 to 8000 feet, and at almost regular intervals surmounted by snow-capped peaks of nearly double that altitude. From the Cascade Range eastward to the Blue Mountains, about 70 miles, and farther on to the eastern boundary of the state, the surface is diversified by mountains and valleys, rolling plains, and tablelands. Here the soil and climate are suitable for agriculture and grazing. In Western Oregon is the Willamette valley, 130 miles long and 60 miles

wide, every foot of which is arable and fertile—adapted by soil and climate to grain and fruit. The valley is situated between the Coast Range and the Cascade Range of mountains. South of this are the Umpqua and Rogue River valleys, both of which produce large quantities of fruit.

The climate of Oregon is mild, in spite of its northerly situation, owing first to the oceanic current from Japan, which, starting with a temperature of 90°, is from 49° to 54° off the coast here. Moreover, the cold Arctic winds are warded off by the Cascade Range, and no blizzard can cross the Rocky Mountains. The range of temperature from summer to winter is small. On the coast the climate is mild and varies little, but there is fog in summer and excessive rain in winter; in the Willamette valley the summers are pleasant, the winters wet, and spring and autumn foggy in the mornings; the Umpqua valley has a delightful climate, with some snow in winter; and the same, with greater heat and cold, is true of the Rogue River valley, the lake region in the south-east, and Eastern Oregon, where there is a good deal of snow in winter. The average mean temperature is 50° F., the rainfall 36 inches—17 at Linkville, in the interior, and 59 at Astoria, on the coast.

The grain-crops of Oregon are wheat, oats, barley, rye, and maize, in this order. Flax-seed, hay, potatoes, tobacco, and hops (principally along the rivers Willamette and Mackenzie) are also raised. From three to four million pounds of butter and cheese are produced annually. Great quantities of fruit, both green and dried, are annually shipped from the state, especially from the western districts; but in Eastern Oregon, too, excellent fruit is produced, and, as the bunch-grass is fast disappearing, and the herds of cattle are diminishing, agricultural and horticultural pursuits are receiving more attention. The lands best suited for fruit-farming are mainly limited to the valleys and foot-hills; but these are of vast extent, and the extreme richness of the soil and the mildness of the climate make the state's productive powers almost inconceivably great. The demand abroad for Oregon fruits more than doubled annually from 1885 to 1890. The most successful fruits are the Italian prune, apples (Oregon is called 'the land of red apples'), pears, peaches, grapes, and cherries (the Royal Ann cherries grow too large for one bite). The wealth of Oregon in timber is remarkable. The Oregon Pacific Railroad, in crossing the Cascade Range, passes through a great timber belt extending for 90 continuous miles; and it is stated that careful examination shows in one locality enough timber on one square mile to supply for twenty years a mill cutting 150,000 feet a day.

Among the other industries of Oregon may be mentioned the catching and tinning of salmon (430,000 cases were shipped from the Columbia River in 1890), the rearing of sheep (Eastern Oregon produces large quantities of wool of good quality), and mining. The minerals of the state comprise coal (29,600 tons in 1885), iron ore, gold (14,965 ounces), copper, nickel, quicksilver, fire-clay, chrome, silver, manganese, zinc, lead, and platinum. Trade is facilitated by numerous lines of railway, and the navigable rivers have steamers running all the year. In 1891 there were three through lines connecting Oregon with the east and south, and another was in construction.

Under the title of Oregon was formerly included all the land between the Rocky Mountains and the Pacific Ocean north of 42° N. lat. John Jacob Astor established Astoria (q.v.) in 1811; in 1813 it was sold to the North-western Fur Company, and it afterwards passed into the possession of the Hudson Bay Company. Great Britain's claim to

the territory was based on Drake's discovery of the coast in 1579, Cook's visit to Juan de Fuca Strait in 1778, the explorations of Captain John Meares in 1788-89, and Vancouver's survey of the entire coast from 30° to 60° N. lat., and discovery and ascent of the Columbia River, in 1792. A treaty of joint occupation was agreed to between Britain and the United States in 1818, and endured until 1846. Settlement by the New Englanders began in 1832, and an Indian mission was planted at Salem by the Methodists in 1834. The Oregon question was a prominent feature of the presidential contest in 1844. In 1846 the dispute was compromised, the boundary line with British America being fixed at 49° N. lat. Oregon became a territory in 1848, and, with reduced limits, a state in 1859. It has thirty-one counties, and sends one representative to congress. The judges of the supreme court are elected by popular vote. The total value of property in 1890 was \$115,000,000. The public school system consists of district schools (1693 organised districts in 1890, with 1499 school-houses and 2566 teachers) free to all between the ages of four and twenty, the state university at Eugene, the state agricultural college at Corvallis, and four normal schools, besides institutions for the blind, deaf and dumb, and orphans. There are also thirty-three private and denominational institutions. The principal cities are Portland, the metropolis (pop., with suburbs, 75,000), Salem, the capital (12,000), Astoria and Albany (7000), and Eugene (4000). Pop. of the state (1860) 52,464; (1880) 174,768; (1890) 313,767.

Oregon River. See COLUMBIA.

Orel, a town of Russia, stands on the Oka, 222 miles by rail SSW. of Moscow, has manufactures of ropes, tallow, bricks, machinery, and verdigris, and a busy trade in grain, ropes, and tallow. It was burned down in 1848 and again in 1858. Pop. (1883) 76,601—The government of Orel, an agricultural and busy industrial region, has an area of 18,036 sq. m., and a pop. (1883) of 1,918,342.

Orellana. See AMAZON.

Orelli, KASPAR VON, scholar, was born at Zurich, 13th February 1787. Ordained in 1806, he next year became a Reformed preacher at Bergamo; in 1813 a teacher in the cantonal school at Coire; in 1819 professor at Zurich, and in 1833 professor of Classical Philology in the newly-founded university. He died at Zurich, 6th January 1849. Orelli edited many classical authors with great learning, taste, and acute discrimination, in particular Horace (1837-38), Tacitus (1846-47), and Cicero (1826-31). His *Onomasticon Tullianum* (1836-38) and *Inscriptionum Latinarum Selectarum Collectio* (1828) also deserve mention.

Orelli, KONRAD VON, theologian, was born at Zurich, 25th January 1846, and studied at Lausanne, Zurich, Erlangen, and especially theology at Tübingen, and oriental languages at Leipzig. In 1869 he became orphan-house preacher at Zurich, *privat-docent* in 1871, professor extra-ordinary of Theology at Basel in 1873, and ordinary professor there in 1881. Among his writings are *Die Alttestamentliche Weissagung von der Vollendung des Gottesreichs* (1882; Eng. trans. 1885) and admirable Commentaries on Isaiah (1887; trans. 1889), Jeremiah (1887), Ezekiel and the Twelve Minor Prophets (1888).

Orenburg, a town of European Russia, stands on the river Ural, by rail 727 miles ESE. of Moscow. Founded (1743) as a frontier fortress, it is now of importance for its commerce only; it imports cotton, silk-stuffs, cattle, hides, &c. from Bokhara, Khiva, and Tashkent. Corn, metals, sugar, woven goods are the principal exports. The

town possesses an arsenal and two military schools. Pop. (1882) 42,123.—The *government* has an area of 73,794 sq. m. and a pop. of 1,198,360, of very mixed races, Bashkirs (246,000) and Cossacks (229,000) predominating.

Orense, capital of a Galician province of Spain, near the frontier of Portugal, on the left bank of the Minho, and 60 miles from its mouth. It has hot sulphurous springs, and manufactures woollens, linens, and chocolate. Pop. 13,291.

Oreodaphne, a genus of trees of the natural order Lauraceæ, sometimes called Mountain Laurel. *O. opifera* is a native of the countries on the lower part of the Amazon. A volatile oil obtained from the bark is used as a liniment, and when kept for a short time deposits a great quantity of camphor. *O. cupularis* is a very large tree with strong-scented wood, the bark of which yields the cinnamon of Mauritius. It grows also in Bourbon and Madagascar. *O. fœtens*, a native of the Canaries, has wood (*Til-wood*) of a most disagreeable odour. *O. bullata*, found at the Cape of Good Hope, is also remarkable for the disagreeable odour of its wood, the *Stink-wood* of the colonists; but it is hard, durable, beautiful, takes an excellent polish, and is used in shipbuilding.

Oreodonts, an extinct family of ungulates, the remains of which occur in the Tertiary deposits of North America.

Orestes, son of Agamemnon and Clytemnestra. When his father was murdered by his mother and her paramour Ægisthus he was saved by his sister Electra, who sent him secretly to Phocis to the court of Strophius, husband of Agamemnon's sister. Here he formed a romantic friendship with the king's son, Pylades, and as soon as he had grown up the pair went secretly to Argos, and slew Clytemnestra and Ægisthus. Madness seized him after the matricide, and he fled from land to land, ever haunted by the avenging Erinnyes or Furies. At Athens, whither he had fled by advice of Apollo, he was purged of guilt by the Areopagus. Learning from Apollo, according to another story, that he could only recover from his madness by carrying off the statue of Artemis from the Tauric Chersonesus, he journeyed thither along with Pylades, but the friends were seized by the natives to be sacrificed to Artemis. Her priestess Iphigenia recognised her brother in Orestes, and all three escaped together, carrying the statue with them. Orestes recovered his father's kingdom at Mycenæ, slew Neoptolemus, and married his wife Hermione, who had been formerly promised to himself. The story of Orestes afforded a favourite theme to the great tragedians—to Æschylus in the extant trilogy, the *Oresteia*: *Agamemnon*, *Choephori*, and *Eumenides*; to Sophocles in his *Electra*; to Euripides in his *Orestes* and *Electra*. See Becker, *Die Orestes-sage der Griechen* (Wittenberg, 1858).

Orfila, MATHIEU JOSEPH BONAVENTURE, founder of the science of toxicology, was born at Mahon in Minorca, 24th April 1787, and studied at Valencia, Barcelona, and Paris (whither he was sent by the junta of his province). In October 1811 he received the degree of Doctor of Medicine, and immediately commenced a private course of lectures on chemistry, botany, and anatomy, which was largely attended, and, along with his successful practice, soon rendered him famous. In 1813 appeared the first edition of his celebrated work on poisons, entitled *Traité de Toxicologie Générale* (Paris). In 1819 he was created a citizen of France, and became professor of Jurisprudence; and in 1823 he was transferred to the chair of Chemistry, to which in 1831 was added the deanship of the faculty. On the outbreak of the revolution of 1848 he was deprived of his place in the medical

faculty on account of his conservative opinions, but retained his professorship. He died at Paris, March 12, 1853. Other works were on medical chemistry (1817) and on forensic medicine (1825). He also contributed largely to various journals, dictionaries, and encyclopædias.

Orford. See WALPOLE.

Organ (Gr. *organon*, 'an instrument'), a musical instrument played by keys, and generally also by pedals, and consisting of metal and wood pipes, which sound by wind stored in bellows, and admitted into them at will. The following description is necessarily restricted to the most fundamental arrangements of this very complicated instrument. As met with in cathedrals and large churches, the organ comprises four or sometimes five departments, each in most respects a separate instrument with its own mechanism, called respectively the *great-organ*, the *choir-organ*, the *swell-organ*, the *pedal-organ*, and sometimes the *solo-organ*. Each has its own keyboard, but the different keyboards are brought into juxtaposition, so as to be under the control of one performer. Keyboards played by the hands are called *manuals*; by the feet, *pedals*. Three manuals, belonging to the choir, great, and swell organs respectively, rise above each other like steps in front of the performer, while the pedals by which the *pedal-organ* is played are placed on a level with his feet. The condensed air supplied by the bellows is conveyed through a *wind-trunk* into a *wind-chest*. Each department of the organ, it may be mentioned, has its wind-chest. Attached to the upper part of the wind-chest is the *upper board*, an ingenious contrivance for conveying the wind at pleasure to any individual pipe, or pipes, exclusively of the rest. In the upper board are set the *pipes*, of which a number of different quality, ranged behind each other, belong to each note. Beneath the upper board is a row of parallel *grooves*, running horizontally backwards, corresponding each to one of the keys of the instrument. On any of the keys being pressed down, a valve is opened which supplies wind to the groove belonging to it. The various pipes of each key stand in a line directly above its groove, and the upper surface of the groove is perforated with holes bored upwards to them. Were this the whole mechanism of the sound-board the wind on entering any groove would penetrate all the pipes of that groove; there is, however, in the upper board another series of horizontal grooves at right angles to those beneath, supplied with *cross-slides*, which can be drawn out or pushed in at pleasure by a mechanism worked by the *draw-stops* placed within the player's reach. Each slide is perforated with holes, which, when it is drawn out, complete the communication between the wind-chest and the pipes: the communication with the pipes immediately above any slide being, on the other hand, closed up when the slide is pushed in. The pipes above each slide form a continuous set of one particular quality, and each set of pipes is called a *stop*. Each department of the organ is supplied with a number of stops, producing sounds of different quality. The *great-organ*, some of whose pipes appear as show-pipes in front of the instrument, contains the main body and force of the organ. Behind it stands the *choir-organ*, whose tones are less powerful, and more fitted to accompany the voice. Above the choir-organ is the *swell-organ*, whose pipes are enclosed in a wooden box with a front of louver-boards like Venetian blinds, which may be made to open and shut by a pedal, with a view of producing *crescendo* and *diminuendo* effects. The *pedal-organ* is sometimes placed in an entire state behind the choir-organ, and sometimes divided and

a part arranged on each side. The most usual compass of the manuals is from C on the second line below the bass staff to F above the third ledger line over the treble staff; and the compass of the pedals is from the same C to the F between the bass and treble staves—i.e. two octaves and a half. The real compass of notes is, as will be seen, much greater.

Organ-pipes vary much in form and material, but belong to two great classes, known as *flue-pipes* and *reed-pipes*. A section of one of the former is represented in the figure. Its essential

parts are the *foot a*, the *body b*, and a flat plate *c*, called the *language*, extending nearly across the pipe at the point of junction of foot and body. There is an opening, *de*, in the pipe, at the spot where the language is discontinuous. The wind admitted into the foot rushes through the narrow slit at *d*, and, in impinging against *c*, imparts a vibratory motion to the column of air in the pipe, the result of which is a musical note, dependent for its pitch on the length of that column of air, and consequently on the length of the body of the

pipe: by doubling the length of the pipe we obtain a note of half the pitch, or lower by an octave. Such is the general principle of all flue-pipes, whether of wood or of metal, subject to considerable diversities of detail. Metal pipes have generally a cylindrical section, wooden pipes a square or oblong section. A flue-pipe may be stopped at the upper end by a plug called a *tompion*, the effect of which is to lower the pitch an octave, the vibrating column of air being doubled in length, as it has to traverse the pipe twice before making its exit. Pipes are sometimes half-stopped, having a kind of chimney at the top. The *reed-pipe* consists of a reed placed inside a metallic pipe. This *reed* is a tube of metal, with the front part cut away, and a tongue or spring put in its place. The lower end of the tongue is free, the upper end attached to the top of the reed; by the admission of air into the pipe the tongue is made to vibrate, and, in striking either the edge of the reed or the air, produces a musical note, dependent for its pitch on the length of the tongue, its quality being determined to a great extent by the length and form of the pipe or bell within which the reed is placed. When the vibrating tongue does not strike the edge of the reed, but the air, we have what is called the *free reed*, similar to what is in use in the Harmonium (q.v.). To describe the pitch of an organ-pipe terms are used derived from the standard length of an open flue-pipe of that pitch. The largest pipe in use is the 32-foot C, which is an octave below the lowest C of the modern pianoforte. There is, however, now in the new Sydney organ a pedal stop 64-foot tone. By a 32-foot or 16-foot stop we mean one whose lowest note is produced by a pipe 32 feet or 16 feet in length.

The *stops* of an organ do not always produce the note properly belonging to the key struck; sometimes they give a note an octave, or, in the pedal-organ, even two octaves lower, and sometimes one of the harmonics higher in pitch. *Compound* or *mixture stops* have several pipes to each key, corresponding to the different harmonics of the ground-tone. There is an endless variety in the number and kinds of stops in different organs; some are, and some are not continued through the whole range of manual or pedal. Some of the more important stops are called *open* or *stopped diapason* (a term which implies that they extend throughout the whole compass of the keyboard). The stops on an organ are principally of 8 feet in the manuals. The *dulciana* is an 8-foot manual stop, of small diameter, so called from the sweetness of its tone.

Among the reed-stops are the *clarion*, *oboe*, *bassoon*, *vox humana*, *trumpet* or *posuane*, and *trombone* or *ophicleide*, deriving their names from real or fancied resemblances to these instruments and to the human voice. Of the compound-stops the most prevalent in Britain is the *sesquialtera*—more frequently called *mixture*—consisting of three to five ranks of open metal pipes, often a 17th, 19th, 22d, 26th, and 29th from the ground-tone. The resources of the organ are further increased by appliances called *couplers*, by which a second manual and its stops can be brought into play, or the same manual can be united to itself in the octave below or above.

Organs are now generally tuned on the equal temperament (see *TEMPERAMENT*). The notation for the organ is in three staves, consisting of a treble and two bass clefs; but in old compositions the soprano, tenor, and alto clefs are used.

The organs used in antiquity were principally water-organs. Large water-organs were employed to accompany the performances at the Roman theatres, and similar instruments were to be found in the hippodromes of Constantinople. The scope of the instrument was therefore originally secular, and one of the earliest patrons of the organ was the Emperor Nero. Ctesibius of Alexandria must be credited with the invention of the organ. Taking the idea from a peculiar sort of clepsydra or water-clock which he had invented, and one function of which was to tell the hours of the night by musical notes, he worked onwards from invention to invention until he constructed the earliest water-organs. The instruments shown to Nero and the first organs ever seen in Rome were from the designs of Ctesibius. The water mechanism in the 'water-organs' was connected solely with the blowing, and seems to have been insisted on so strongly by the early organ-builders in order to render that operation equable and steady. By means of pistons working in cylinders the wind was pumped through water into the wind-chest, where were set the pipes, furnished on the bottom with slides, which were connected with iron keys by strings or trackers. Such was the main difference between the water-organ and the wind-organ. The water-organ became the rage of Rome and increased in favour as the empire hastened to its decline. In the reign of Honorius (400 A.D.) no nobleman's house was considered complete without its organ, and portable water-organs were made in great numbers which could be carried by slaves from house to house, where concerts or musical gatherings were attended by their masters. After the overthrow of the western empire organ-building seems to have been lost, among other useful arts, under the influence of the barbarian invasions. Constantinople, however, remained what it had always been, the great home of organ-building in the ancient world. The magnificence of the organs in the Golden Hippodrome is spoken of with enthusiasm by the Byzantine historians. An organ which was brought by certain Byzantine ambassadors on a mission to Charlemagne is said to have served as a model for the first organ ever built in mediæval Europe, constructed by the orders of that emperor according to the Greek pattern. From Aix-la-Chapelle the use of organs spread throughout Charlemagne's empire, and this instrument served as a model for the rest.

The application of bellows to the organ was known in the days of the later Roman emperors. On the obelisk of Theodosius we have a delineation of an organ blown solely by bellows. Probably the invention of the bellows mechanism dates from the time of the Emperor Julian. Yet this great secret of organ-building was rarely if ever acted upon; and until the end of the 9th century, when Germany had become the centre of organ-building,

water-organs were the almost exclusive form of organ employed both in Europe and the East. Towards the end of the 9th century large bellows organs began to be built, in keeping with the large Romanesque churches of the times. Thirty bellows were employed in some of these organs; the outstretched arms of the organist could not span the compass of an octave; and the player or players struck each key with their fist. In the monasteries, meanwhile, where size was not so much in demand, the mechanism of the organ was marvellously elaborated. The complete furnishings of the organ parts were manufactured in the monasteries, even down to the smelting of the metals whereof the pipes were made. Those diminutive organs, called regals, so small that they could be held on the palm of the hand, were the outcome of monastic ingenuity, and Pope Sylvester II. was a warm patron of organ-building, and himself no mean inventor in the art.

The family of the Antignati, in Brescia, had a great name as organ-builders in the 15th and 16th centuries. The organs of England were once in high repute, but the puritanism of the Civil War doomed most of them to destruction; and when they had to be replaced after the Restoration it was found that there was no longer a sufficiency of builders in the country. Foreign organ-builders were therefore invited to settle in England, the most remarkable of whom were Bernhard Schmidt (generally called Father Smith), his nephews, and Renatus Harris. Christopher Schreider, Snetzler, and Byfield succeeded them; and, at a later period, Green and Avery, some of whose organs have never been surpassed in tone. The largest English organs are those of the Royal Albert Hall, St Paul's Cathedral, the Alexandra Palace, the Crystal Palace, St George's Hall, Liverpool, and the Leeds Town-hall. The German organs are remarkable for preserving the balance of power well among the various masses, but in mechanical contrivance they are surpassed by those of England.

The largest organ in the world is usually said to be that in the cathedral of Seville, which is stated to have 110 stops and 5300 pipes. There are several organs in that cathedral, and this immense organ is said to exceed them all considerably in size. The method of blowing it is peculiar: a man walks up and down a long plank, arranged like the familiar 'see-saw,' the motion of which fills the bellows. Since, however, there is a conflict of testimony as to the Seville organ, and no certain indication of its magnitude can be gathered except by reports upon hearsay, the superiority in point of size among the organs of Europe is usually conceded to the Dutch organs. The organ in the cathedral of St Lawrence at Rotterdam is an immense structure, containing a great organ with 18 stops, a choir with 15, a positive with 18, an echo with 8, and a pedal-organ with 16 stops. These, along with 11 accessory stops, make up a total of 86 stops. The organ at the cathedral of St Bavon at Haarlem was long celebrated as the largest in the world. It took three and a half years to build, and cost £10,000. It possesses 4088 pipes and 60 stops, exclusive of accessory stops. The organ of the Protestant Church in Utrecht has 59 stops, including the accessory ones; that in the Octagon Church at Rotterdam possesses a total complement of 52 stops. St Peter's at Rome has four smallish organs, the largest of which has only 2 manuals and pedal, and 27 stops in all, thus divided—great, 17; swell, 6; pedal, 4. The second largest organ in St Peter's has but 1 manual and pedal. Generally speaking, the Italian organs are much inferior in point of size to those of the northern nations.

Up till the middle of the nineteenth century, little

interest was taken in organ-building in America. The erection of the great organ in the Music Hall, Boston, by a German builder, Walcker of Würtemberg, gave the first impetus to public interest in the matter. Roosevelt of New York, and Jardine, likewise of New York, are two of the best-known organ-builders in America at the present time. Roosevelt has invented 'the automatic adjustable combination,' which enables the player to place any required combination of stops under immediate control, and to alter such combinations as frequently as desired. By his construction of the wind-chest, also, each pipe has its own valve, actuated by compressed air. Among the largest organs in America are the organs of the Roman Catholic Cathedral, Montreal, the cathedral of the Holy Cross, Boston, which possesses 83 stops; the Music Hall, Cincinnati, with 96 stops and 4 manuals, and the Tremart Temple, Boston, with 65 stops.

For the structure of the organ, see Hopkins and Rim-bault, *The Organ* (Lond. 1855). For the history of the organ, see Rowbotham's *History of Music*, vol. iii. chaps. 3, 6; and book iv. chap. 2 (Lond. 1887). For organ-playing, see Archer's *Practical Organ Tutor*, Best's *School for the Organ*, Stainer's *The Organ*. There are also works on the organ by Warman (1882-87) and Audsley (1889), and a very full organ bibliography in *Notes and Queries* for 1890. The American organ is discussed at HARMONIUM; and BARREL-ORGAN is a separate article.

Organ, Organic, Organism, terms derived from the Greek *organon*, 'an instrument,' and still retaining in some of their applications that significance. But the words have found special acceptance in connection with the forms of life; Linnaeus described these, whether animals or plants, as *Organisata*; and we constantly speak of them as organisms, of their larger, well-defined, and integrated parts as organs, of their internal activity and its products as organic. Prior to the year 1828 it was believed that certain chemical compounds which were produced as the results of vital processes occurring within the tissues of animal and vegetable organisms could not be obtained by the ordinary methods of the chemical laboratory; and these compounds were, for this reason, designated as organic. Wöhler in that year, however, discovered that urea, the most important solid constituent of urine, could be obtained 'artificially,' as it has been called, from inorganic materials. Since that date a very large number of so-called organic compounds have been prepared artificially, so that the original signification of the term 'organic' does not hold any longer; and the old conception of an organism as an engine-like collection of organs with fixed functions is disappearing before the doctrine that it is the protoplasm or living stuff in all parts of the body that is the basis of all vital activities. The title of organic chemistry is now commonly applied to the chemistry of the compounds of carbon, whether these compounds are obtainable only as the products of vital processes or not; see the articles CHEMISTRY and ANALYSIS (ORGANIC). Organic impurities in water are those due to animalcules, bacteria, and decomposing organisms; while such phrases as 'organic disease,' 'organic connection,' refer to the relation between a living organism and its parts. See BIOLOGY, FUNCTION, MORPHOLOGY, PHYSIOLOGY.—For organic bases, see ALKALOIDS; for organic radicals, see RADICAL.

Organo-metallic Bodies. Under this term are included a large number of chemical compounds in which organic radicals, such as methyl, CH_3 , ethyl, C_2H_5 , &c., are united to metals. Amongst the earliest obtained of these substances were those derived from the metal zinc. Zinc-methyl, $\text{Zn}(\text{CH}_3)_2$, and zinc-ethyl, $\text{Zn}(\text{C}_2\text{H}_5)_2$, which may be taken as examples of the class, are colourless liquids, heavier than water, which boil at 46° and

118° C. respectively. They take fire spontaneously in contact with air, and burn with the production of a dense white smoke of oxide of zinc. In contact with the skin they give rise to severe wounds which are very difficult to heal. They are decomposed with great energy by water. Substances analogous to these zinc compounds have been prepared, containing cadmium, magnesium, antimony, arsenic, bismuth, tin, aluminium, mercury, lead, sodium, potassium, and some rare metals.

For further information on this subject, see an article by Dr Frankland, in the 13th vol. of the *Quarterly Jour. of the Chemical Soc.*; also the article on 'Organometallic Bodies' in Watt's *Dict. of Chemistry*; or any of the larger recent text-books of organic chemistry.

Organzine. See SILK.

Orgies, secret rites or customs connected with the worship of some of the pagan deities; as the secret worship of Demeter, and the festival of Dionysus, which was accompanied with many customs of mystic symbolism, and much license. From this latter accident comes obviously the modern sense of drunkenness and debauchery implied in the word. See MYSTERIES.

Oribasius, a Greek medical author, and physician to Julian the Apostate (326-403 A.D.). He was born at Pergamus or Sardis, and his works are largely compilations from Galen (see MEDICINE, p. 117). There is an edition of his works in 6 vols. by Buffemaker and Daremberg (Paris, 1852-76).

Oriel Movement. See KEBLE, NEWMAN.

Oriel Window, a projecting window in an upper story, supported on corbels, having more sides than one, usually three, and commonly divided into bays by mullions. It is one of the most picturesque features in mediæval and Elizabethan domestic architecture, and adds much to the convenience of the interior. The word oriel (Mid. Lat. *oriolum*, probably dim. from *os*, *oris*, as if a small opening or recess) formerly meant a chamber or apartment, and a window is so called which makes, as it were, a small apartment off a large room. By old writers oriels are called Bay Windows (q.v.).

Orientation, in Architecture, is the position of a church so that its chancel shall point towards the east. This was a fashion invariably adopted in northern countries, but not adhered to in Italy and the south. St Peter's at Rome, for example, has the choir to the west, and the principal entrance towards the east. The orientation of churches is not usually very exactly to the east, and it is supposed that the east end in some cases has been set so as to point towards the place where the sun rises on the morning of the patron saint's day. In other cases the choir and nave are not built exactly in a straight line, the choir having thus a slight inclination to one side, which in the symbolism of the middle ages was supposed to indicate the bowing of our Saviour's head upon the cross. This departure from the line of the true east, however, in many instances arose more probably from carelessness or ignorance.

Oriflamme, the red silk banner first of the Abbey of St Denis, and afterwards of France, was so called because it was a flag (*flamme*) borne on a gilded (or = 'gold') staff. See FLAG.

Origen, the most learned and original of the early church fathers, and perhaps the noblest figure amongst them all, was born, probably at Alexandria, in 185 or 186. His full name was Origenes Adamantius. He was the son of the Christian martyr Leonidas, who was beheaded under Severus in 202. 'Origen was great even from his cradle,' says Jerome. In the early years when he was instructed by his father, Eusebius tells us, 'the

simple and easy meanings of the sacred Scriptures were not enough for him, but he sought something deeper,' and Leonidas would often bend over his son's bed as he lay asleep and kiss his breast, 'which the Spirit of God had made His temple.' In the catechetical school of Clement he formed the friendship of Alexander, afterwards Bishop of Jerusalem. He encouraged his father to martyrdom, and his purpose of joining him in this was only frustrated by the artifice of his mother, who concealed all his clothes. After his father's death he supported his mother and six brothers by teaching 'grammar,' and from his eighteenth year he acted, with the consent of his bishop Demetrius, as master of the catechetical school. A collection of classical books which he had bought or copied out for himself he sold for a sum which yielded him four obols (or about 6d.) a day, which sufficed for his simple wants for many years. According to Eusebius he went so far in his asceticism as to mutilate himself, following a literal interpretation of Matthew, xix. 12, but by some this is doubted. His intercourse with heretics and educated heathens led him to devote himself to more thorough study of Plato, the later Platonists and Pythagoreans, and the Stoics, under the guidance of the Neoplatonist Ammonius Saccas. At Alexandria he taught for twenty-eight years (204-232), composed the chief of his dogmatic treatises, and commenced his great works of textual and exegetical criticism. The labours of those years were interrupted by journeys to Rome, Arabia, Antioch, and other places. During a visit to Palestine in 216 the bishops Alexander of Jerusalem and Theoctistus of Cæsarea had employed him to deliver public lectures in the churches, and on a later occasion (in 230) had consecrated him as a presbyter without referring to his own bishop. A synod held at Alexandria under Demetrius forbade him to teach in that city, and a second Alexandrian synod (consisting of bishops only) deprived him of the office of presbyter. The churches of Palestine, Phœnicia, Arabia, and Achæa declined, however, to concur in this sentence. Origen then settled at Cæsarea in Palestine, which was his chief home for twenty years. He there founded a school which afforded its disciples a thorough training in literature, philosophy, and theology. Among their number were Gregory Thaumaturgus and Firmilian of the Cappadocian Cæsarea. In the latter city Origen took refuge for two years during the Maximinian persecution. In the last twenty years of his life he made many other journeys. In the Decian persecution he was arrested at Tyre and cruelly tortured. He died there in 253 or 254.

Origen was a most voluminous writer. 'Which of us,' asks Jerome, 'can read all that he has written?' Yet the statement of Epiphanius that his works numbered 6000 is doubtless exaggerated. His exegetical writings extended over nearly the whole of the Old and New Testaments, and included *Scholia* (short notes), *Homilies*, and *Commentaries*. Of the Homilies only a small part has been preserved in the original, much, however, in the Latin translations by Rufinus and by Jerome; but unfortunately these cannot be relied upon, for the translators thought fit to modify and tamper with them. Of the Commentaries a number of books on Matthew and on John are extant in Greek, those on John of great value for the study of his speculative theology. Origen's gigantic *Hexapla*, the real foundation of the textual criticism of the Scriptures, was too large to be preserved entire. The remains of its text of the Septuagint were collected by Bern. de Montfaucon (2 vols. fol. Paris, 1713) and Field (2 vols. Oxford, 1875). His *Eight Books* against Celsus (q.v.), written in his old age, are preserved entire in the original Greek. This, the greatest of early Christian apologies, effectively appeals

to the Christian life as the most convincing proof of the Christian faith. The speculative theology of Origen is presented in his four books *Peri Archôn*, extant as a whole only in the somewhat garbled Latin translation of Rufinus. It is a bold attempt to evolve from the church's rule of faith, with the help of Scripture and reason, a science of Christian faith. Two books *On the Resurrection* and ten books of *Stromata* (in which he proved all the Christian dogmas by quotations from the philosophers) are lost. The eclectic philosophy of Origen bears the distinctive stamp of Neoplatonist and Stoic theories. God alone has being in the proper sense. It is essential to the Deity to will, work, and reveal Himself unchangeably and eternally. In the Logos, proceeding by eternal generation from God, and of the same substance with Him, all creative ideas are concentrated. He is the link between the oneness of Deity and the multiplicity of the world. All finite being is good only as it has part in the Divine. All created spirits are free. Their fall led to the creation of the material world, that in forms more or less material (*soul* and *body*) the renewing discipline of the *spirit* within might be realised. The idea of the procession of all spirits from God, their fall, their redemption, and return to God lies at the foundation of the whole development of the world, at the centre of which is the incarnation of the Logos for the revelation of redeeming truth and the union of divine forces with humanity. Origen's system is an elaborate web, of which Greek metaphysics is the warp, the gospel history the woof. All that was true in Greek philosophy Origen held to be traceable to the general revealing agency of the Logos, who in Christianity alone is fully and expressly manifested. The proper source of the knowledge of the Christian faith is the Word of Christ (i.e. the Scriptures). A living faith in those truths of Scripture which have been handed down as fundamental by the church's succession of bishops is itself sufficient for salvation. Beyond such 'unreasoning faith' there is the 'knowledge' or 'wisdom' which rises to the free love of God, and leaves behind it the historical contents of the church's teaching, which have served to it as the media of spiritual ideas in its progress from practical faith to the vision of God and likeness to Him. It is by entering more deeply into the successive senses of Scripture that this process is carried out. Scripture admits of a threefold interpretation, in correspondence to the tripartite nature of man. The 'bodily' (literal or historical) sense is always to be retained, except where it is unworthy of God or contradictory to reason; for God has intended such passages to be 'stumbling-blocks,' suggesting the necessity of seeking a deeper meaning. The *Psychical* (or ethical signification) is next; and beyond it is the *Pneumatic* (allegorical or mystical) sense.

Unhappily for the memory of Origen, his name was chiefly remembered in connection with the most erroneous part of his work. His fanciful method of interpretation was perpetuated alike in the east and the west, and the fruits of his gigantic labours were appropriated by orthodox theologians, who branded him as a heretic, and doubted of his salvation. Long after his death malignant falsehoods were heaped upon his name by unscrupulous enemies like Theophilus of Alexandria; and not merely the heresy of maintaining the ultimate restitution of all mankind, but even heresy respecting the nature of Christ was triumphantly discovered in his writings. Yet, heterodox though he was, not one amongst those honoured by the church as saints surpasses him in saintliness or spiritual elevation of character. 'His whole life,' says Bishop Westcott, 'from first to last was fashioned on the same type. It was, according to his own

grand ideal, "one unbroken prayer," one ceaseless effort after close fellowship with the Unseen and the Eternal. No distractions diverted him from the pursuit of divine wisdom. No persecution checked for more than the briefest space the energy of his efforts. He endured a double martyrdom: perils and sufferings from the heathen, reproaches and wrongs from Christians; and the retrospect of what he had borne only stirred within him a humbler sense of his shortcomings.'

There is as yet no complete critical edition of Origen's works; the best apology for this is that of the uncle and nephew, De La Rue (4 vols. folio, Paris, 1733-59), reprinted by Lommatsch (26 vols. Berlin, 1831-48), and by Migne, *Patrol. Cura. Compl.*, ser. Gr., vols. xi.-xvii. The Prolegomena to a critical edition by Dr Ph. P. Koetschau of the work against Celsus appeared in 1890. The work of P. D. Huet, *Origenis in sacras Scripturas Commentaria quaecunque Graece reperi potuerunt* (2 vols. Rothomagi, 1668), was the foundation of the critical study of Origen. For an account of his theological opinions and the great controversies that these originated, see the works on church history by Baur, Neander, Dorner, Böhlinger, Schaff, and E. de Pressensé; also E. W. Möller, *Geschichte des Kosmologie in der Griechischen Kirche bis auf Origenes* (Halle, 1860); Kahnis, *Die Lehre vom Heiligen Geist* (1847); and the following special books: Thomasius, *Origenes* (Nürnberg, 1837); Moehler, *Patrologie* (Regensb. 1840); and especially Redepenning, *Origenes, eine Darstellung seines Lebens und seiner Lehre* (2 vols. Bonn, 1841-46). See also Joly, *Étude sur Origène* (Dijon, 1860); Freppel, *Origène* (Paris, 1868); J. Denis, *La Philosophie d'Origène* (Paris, 1884); as also Harnack's *Dogmengeschichte* (2d ed. 1888) and Farrar's *Lives of the Fathers* (1889).

Original Sin. See SIN.

Orihnela (the *Aurivuelah* of the Moors), a town in the Spanish province of Alicante, on the Segura, 38 miles N. of Cartagena. Situated in a plain of great beauty and fertility, it offers an eastern aspect with its palm-trees, towers, and domes, and has a cathedral, a college, and manufactures of silk, linen, hats, &c. Pop. 20,929.

Orinoco, one of the great rivers of South America, has its origin on the slopes of the Sierra Parima, in the extreme south-east of Venezuela; its exact sources were only discovered in 1836 by M. Chaffanjon. It flows at first west by north, a mountain-stream, as far as 67° W. long. A little below Esmeralda (65° 50' W. long.) it divides and sends off to the south an arm, the Cassiquiare, which, after a course of 180 miles, enters the Rio Negro, a tributary of the Amazon. The other branch on reaching San Fernando (68° 10' long. and 4° 2' N. lat.) is met by the strong current of the Guaviare; the united stream then turns due north, and, after passing over the magnificent cataracts of Maypures and Atures (glowingly described by Humboldt), and picking up the Meta on the left, meets the Apure, which likewise strikes it from the left. Below the confluence with the Apure the Orinoco turns east and traverses the llanos of Venezuela, its waters, with an average breadth of 4 miles, being augmented from the right by the Caura and the Caroni. About 120 miles from the Atlantic, into which it rolls its milk-white flood, its delta (8500 sq. m.) begins. Of the numerous mouths which reach the ocean over 165 miles of coast-line only seven are navigable. The waterway principally used by ocean-going vessels, which penetrate up to Ciudad Bolívar (Angostura), a distance of 240 miles, is the Boca de Navios, varying in width from 3½ to 23 miles. The total length of the river is some 1550 miles, of which 900, up to the cataracts of Atures, are navigable, besides a farther stretch of 500 miles above the cataracts of Maypures; area of drainage basin, 368,600 sq. m. Most of the larger affluents are also navigable for considerable distances, the

Meta, for instance, to within 60 miles of Bogotá, the capital of Colombia. As a rule the river floods the districts adjoining its banks from May to January, the country under water sometimes measuring 100 miles across.

See A. von Humboldt and Bonpland, *Voyage au Nouveau Continent*, vol. ii.; Sir Robert Schomburgk, *Reizen in Guiana* (1841); Michelina y Rojas, *Exploracion Oficial* (Brussels, 1867); and Chaffanjon, *Comptes Rendus of Paris Geog. Soc.* (1887).

Oriole, a genus (*Oriolus*) and family (Oriolidae) of Passerine birds, confined entirely to the Old World, and characteristic of the Oriental and Ethiopian regions. The members of the family are generally of a bright yellow or golden colour, which is well set off by the black of the wings. Twenty-four species are enumerated under the genus. The best known is the Golden Oriole (*O. galbula*). The adult male is about 9 inches long. Its general colour is a rich golden yellow; the bill

Golden Oriole (*Oriolus galbula*).

is dull orange-red; a black streak reaches from its base to the eye; the iris is blood-red; the wings are black, marked here and there with yellow, and a patch of yellow forms a conspicuous wing-spot; the two middlefeathers of the tail are black, inclining to olive at the base, the very tips yellow; legs, feet, and claws dark brown. The female is less yellow than the male, and the under parts are streaked with gray. This bird is somewhat rare in England, but it is an annual spring migrant to Cornwall and the Scilly Isles, and it has been found nesting in the south-eastern counties. In Scotland, especially in the southern districts, it has been reported several times; in Ireland it is more rare. In central and southern Europe it is common in summer in certain localities; it is abundant in Persia, and ranges eastwards through central Asia as far as Irkutsk. It winters in South Africa, where it is found at the Cape, Damaraland, Natal, and Madagascar. In habit it is an unobtrusive bird, fond of the shade of woods, groves, and small ravines, and, although generally accounted very shy, it may be found building its nest in avenues in towns. Its food consists of insects and their larvæ, especially green caterpillars, and fruits such as currants, cherries, and mulberries. The song of the male is short, loud, clear, and flute-like; he has also a mewing call-note, and a harsh alarm-note. The nest is unlike any other European bird's; it is placed in, and suspended from, a fork in a horizontal branch, sometimes of an oak, usually of a pine, in a shady grove or thick wood, and is made of bark, wool, and grass. The eggs number four or five, and are of a glossy, white colour, blotched with reddish purple. Other orioles are distinguished by having black on the head and nape. *O. kundoo* partly replaces the golden oriole in Turkestan, and extends eastwards to India. *O. auratus*, found in Africa between the Sahara and the equator, and *O. notatus*, found throughout south tropical Africa, have the lesser wing-coverts yellow, not black as in the European and Indian

birds. The birds called 'Orioles' in the United States belong to an entirely different family, the Icteridæ. See BALTIMORE BIRD.

Orion, in Greek Mythology, an unusually handsome giant and hunter, the son of Hyrieus of Hyria, in Boeotia. At Chios he fell in love with Merope, daughter of Œnopion, but for an attempted outrage upon the maiden his eyes were put out by Dionysus. Orion recovered his sight by exposing his eyeballs to the rays of the rising sun, and afterwards hunted in company with Artemis. The cause and manner of his death are differently related. Some make Artemis slay him with an arrow, because Eos, enamoured of his beauty, had carried him off to Ortygia, and thereby offended the gods. Others say that Artemis, virgin-goddess though she was, cherished an affection for him that enraged her brother Apollo. One day pointing out to her at sea a black object floating in the water, he told her that he did not believe she could hit it. She took aim and hit the mark, which was the head of her lover swimming in the sea. A third myth makes him find his death from the sting of a scorpion. Æsculapius wished to restore him to life, but was slain by a bolt from Zeus. After his death Orion was placed with his hound among the stars, where to this day the most splendid of the constellations bears his name.

Orissa, an ancient kingdom of India, the authentic history of which goes back for probably more than one thousand years, extended from Bengal on the N. to the Godavari on the S. The present province is the extreme south-west portion of Bengal; on the E. it has the Bay of Bengal, and on the W. the Central Provinces. Orissa was long a Buddhist stronghold; in 474 a new dynasty made it Brahmanical, and introduced the worship of Siva; in 1132 this was replaced by Vishnuism and another dynasty. It ceased to be an independent state in 1568, being conquered and made an outlying province of the empire of the Great Mogul. Its next masters were the Maharrattas, who seized it in 1742; but they were forced to surrender it to the English in 1803. At the present time Orissa is divided between the British commissionership of Orissa and the tributary states, and is accounted part of Bengal Presidency. The commissionership has an area of 9053 sq. m. and a pop. of (1881) 3,730,735; the tributary states, a hilly country with dense jungle, lying between the low coast districts and the interior plateau, has an area of 15,187 sq. m. and a pop. (1881) of 1,469,142. All this region was visited by severe famine in 1868-69. The principal river is the Mahanadi, and the chief towns Cuttack, Balasor, and Puri (Juggernaut, q.v.). The entire district is sacred ground to the Hindus; evidences of the worship of Siva and Vishnu meet the eye at every turn. Great festivals are held in honour of this latter god and of his image called Juggernaut (q.v.). The most interesting of the aboriginal races are the Kandhs (Kondhs, Rhonds), who number 280,000, besides close upon 150,000 in the Central Provinces. Amongst these people agriculture and war are the only employments, the menial offices of village life being performed by a subject, almost slave race. They pay profound reverence to the earth-god, and used to sacrifice human beings to secure his favour, until the practice was suppressed by the British (1837-50). The tribal government is strictly patriarchal. The tribesmen were summoned to arms by messengers bearing an arrow, who sped from glen to glen, like the bearers of the fiery cross in Scotland. Duelling was formerly in vogue. The irrigation of a large portion of Orissa is provided for by an extensive and costly system of canals, taken over by the government in 1868.

See 'An Account of the Religion of the Khonds in Orissa,' in *Trans. Asiatic Soc.* (1851); Campbell's *Personal Narrative of Service amongst the Wild Tribes of Khondistan* (1864); *Calcutta Review*, Nos. IX., XI., XV., and XX.; and *Orissa*, by W. W. Hunter (1872).

Orizaba, capital of the Mexican state of Vera Cruz, 82 miles WSW. of Vera Cruz City, and 181 ESE. of Mexico, lies in a fertile garden country, 4030 feet above the sea, and contains an extensive cotton-factory, paper and corn mills, and railway-shops. Pop. 12,500.—The volcano of Orizaba, 25 miles to the north, is a noble pyramid rising to an elevation of 17,876 feet, or, according to Heilprin's measurements (1890), 18,205 feet. Its last severe eruption was in 1866.

Orkney Islands, a group of ninety Scotch islands, islets, and skerries, of which only twenty-eight are inhabited, and which have an aggregate area of 376 sq. m., the largest being Pomona or Mainland (207 sq. m.), Hoy (53), Sanday (26), Westray, South Ronaldshay, Rousay, Stronsay, Eday, Shapinsay, Burray, Flotta, &c. They extend 50 miles north-north-eastward, and are separated from Caithness by the Pentland Firth, 6½ miles wide at the narrowest. With the exception only of Hoy (q.v.), which has fine cliffs, and in the Ward Hill attains 1564 feet, the scenery is generally tame, the surface low and treeless, with many fresh-water lochs. The prevailing formation is the Old Red Sandstone, with a small granitic district near Stromness; and the soil is mostly shallow, incumbent on peat or moss. The mean annual temperature is 45°, the rainfall 34·3 inches. The area under cultivation has more than doubled since 1850, but is still less than one-half of the total area. The live-stock during the same period has trebled. The holdings are small—16½ acres on an average; and agriculture and fishing are the principal industries. Kirkwall and Stromness, the only towns, are noticed separately, as also are the standing-stones of Stennis and the tumulus of Maeshowe. Orkney unites with Shetland to return one member to parliament, but it was dis- severed therefrom as a county by the Local Government Act, 1889. Pop. (1801) 24,445; (1861) 32,395; (1881) 32,044; (1891) 30,438. The Orkneys (Ptolemy's *Orcade*s) were gradually wrested by Norse rovers from their Pictish inhabitants; and in 875 Harold Haarfager conquered both them and the Hebrides. They continued subject to the Scandinavian crown—under Norse jarls till 1231, and afterwards under the Earls of Angus and Strathern and the Sinclairs—till in 1468 they were given to James III. of Scotland as a security for the dowry of his wife, Margaret of Denmark. They were never redeemed from this pledge; and in 1590, on James VI.'s marriage with the Danish princess Anne, Denmark formally resigned all claims to the sovereignty of the Orkneys. The present landed proprietors are chiefly of Scotch descent, the islanders generally of mixed Scandinavian and Scotch origin.

See J. R. Tudor's *Orkneys and Shetland* (1883); and Wallace's *Description of the Isles of Orkney* (new ed. 1884). For map, see SHETLAND.

Orleans, a city of France, the capital now of the department of Loiret, and formerly of the old province of Orléannais, which comprised the best part of the present departments of Loiret, Eure-et-Loir, and Loir-et-Cher, with portions of four others. It stands in a fertile plain on the right bank of the Loire, here crossed by a nine-arched bridge (1760), 364 yards long, and by rail is 75 miles SSW. of Paris. Close to it is the Forest of Orleans, covering nearly 150 sq. m., and planted with oaks and other valuable trees. The walls and gates have given place since 1830 to handsome boulevards, but the town as a whole wears a lifeless appearance, and

its domestic architecture has much more interest than any of the public edifices. These include the cathedral, destroyed by the Huguenots in 1567, and rebuilt from 1601 onwards by Henry IV. and his three successors; the *Mairie* (1530); and the 15th-century *Musée* (till 1853 the *hôtel-de-ville*). Note-worthy are the house of Agnes Sorel, Diane de Poitiers, and Joan of Arc, of whom there are three statues—the bronze equestrian one inaugurated in 1855. The commerce is far more important than the industries (of which the chief is market-garden- ing), Orleans possessing unusual transit facilities by road and railway, river and canal. Pop. (1872) 48,976; (1886) 57,478. The Celtic *Genabum*, where in 52 B.C. the great Gallic rising broke out against Julius Cæsar, Orleans afterwards (about 272 A.D.) was renamed *Civitas Aureliani*, of which the present name is only a corruption. It was besieged by Attila (q.v.) in 451; passed into the hands of the Franks; and was twice plundered by the North- men (855 and 865). In 1428–29 it was besieged by the English under the Duke of Bedford, but was delivered by Joan of Arc (q.v.), called therefore the Maid of Orleans. Dunois (q.v.) was known as the Bastard of Orleans. The town suffered much in the wars of the Huguenots (q.v.); and in the Franco- German war it again figured prominently, being occupied by the invaders, October 11 to November 9, 1870, and then the headquarters of the great Army of the Loire until its crushing defeat by Prince Frederick-Charles (December 3–5). Orleans was the death-place of the Earl of Salisbury (1429), of Francis II., Mary Stewart's husband (1560), and of the Duke of Guise (1563). See its history by Bimbenet (3 vols. Orleans, 1884–87).

Orleans, DUKES OF. This title has belonged to three distinct dynasties of French princes of the blood. The title was first given in 1392 by Charles VI. to his dissolute brother Louis (1371–1407), who became regent on the king's madness, and was murdered in the streets of Paris at the instigation of the Duke of Burgundy in revenge for his father's death (see Jarry's *Louis de France*, 1890). His successor was his son Charles (1391–1465), the poet. Charles's son Louis succeeded to the throne as Louis XII. in 1498, whereupon the dukedom of Orleans merged in the crown. It was revived in 1628, when Louis XIII. created his ambitious and intriguing brother, Jean Baptiste Gaston (1608–60), Duke of Orleans and Chartres and Count of Blois. He died without male issue, whereupon Louis XIV. at once revived the title in favour of his brother Philippe (1640–1701), the husband of Henrietta, sister of Charles II., and, after her death, of the Princess Charlotte Elizabeth of Bavaria. His daughters married Charles II. of Spain, Victor Amadeus II. of Savoy, and Prince Charles of Lorraine; his son was the regent and debauchee, Philippe (1674–1723), and his great-grandson was the notorious *Egalité*, Louis-Philippe Joseph (1747–93). *Egalité*'s son, Louis-Philippe (1773–1850), bore the title during his exile, and until he became king of the French in 1830. His eldest son, Ferdinand Louis-Philippe Charles Henri (1810–42), took the title, but it was not borne by his son, the Comte de Paris, who in 1883 became the acknow- ledged head of the Bourbon house of France, his son, Louis Philippe Robert (born 1869), assuming the old ducal title. For the Orleanist party, see BOURBON, FRANCE.

CHARLES, DUKE OF ORLEANS, commonly called Charles d'Orleans, was the eldest son of Louis, Duke of Orleans, and of the high-spirited Valentina Visconti, and was born 26th May 1391. He married in 1406 his cousin Isabella, the widow of Richard II. of England, who brought him scarcely her good-will, but an ample dowry of half a million francs. Three years later she died, leaving him a

daughter. He took his share in the intestine struggles of the time, in alliance with the infamous Bernard d'Armagnac, and did his best to avenge on the Duke of Burgundy his father's murder. He commanded at Agincourt (October 1415), and there, or shortly after, was taken prisoner and carried to England, where he spent over a quarter of a century in easy imprisonment at Windsor, Pontefract, Amptill, Wingfield in Suffolk, and the Tower. In his enforced leisure he hunted, hawked, admired the English ladies, and amused himself with turning some hundreds of ballades and rondels, which, conventional and shallow as they are, are easy and graceful in versification, and informed with a musical and tender melancholy that has a singular charm for the reader. His long captivity had made him a martyr to the eyes of Frenchmen—it was one of Joan of Arc's declared intentions to deliver the captive duke, who, she assured her judges, was beloved of God. His imprisonment became ever more irksome to him, but he was at length ransomed in 1440 through the good offices of Philip the Good of Burgundy, son of his father's murderer, and he at once married Philip's niece, Mary of Cleves. But it was soon discovered that there was nothing of the heroic in his temper or capacity, and he quickly sank again into political insignificance. The last third of his life he spent mainly in great dignity and state at his seat at Blois, where he maintained a kind of literary court which was visited by all the elegant poets of that rhyming age. His latest act was a vain attempt to defend the Duke of Brittany from the grasping hand of Louis XI. He died at Amboise, 4th January 1465. His son became Louis XII. of France.

The best edition of the poems of Charles d'Orleans is that of C. d'Héricault in the 'Nouvelle Collection Jannet' (2 vols. Paris, 1874). The *Debate between the Heralds of France and England* is assigned to him by Mr Henry Pyne, its translator and editor; but M. Paul Meyer, in his edition of the French text, has declared against his authorship. See Beaufils' *Etude* (1861); and R. L. Stevenson, in *Familiar Studies of Men and Books* (1882).

JEAN BAPTISTE GASTON, DUKE OF ORLEANS, was the third son of King Henry IV., was born in 1608, and was granted the title in 1626 on his marriage with Marie of Bourbon, Duchess of Montpensier. His wife soon died, leaving one daughter, 'La Grande Mademoiselle.' He troubled France with incessant and bloody but fruitless intrigues against Richelieu, and but for his royal birth would have lost his head like Montmorency, Cinq-Mars, and De Thou. The validity of his marriage with Marguerite of Lorraine was only declared after a long disputation among jurists and theologians. After Richelieu's death a reconciliation was effected between him and the king, and he was appointed lieutenant-general of the kingdom during the minority of Louis XIV. The duke, finding himself impotent in the hands of Mazarin, placed himself at the head of the Fronde, but with his usual selfishness soon threw over his friends and made terms again with the court. After Mazarin's final triumph he was confined to his castle of Blois, where he died, 2d February 1680, leaving three daughters by his second marriage. See his *Mémoires* (Amsterdam, 1683).

PHILIPPE, DUKE OF ORLEANS, regent of France during the minority of Louis XV., was the son of the first Duke Philippe, and the grandson of King Louis XIII., and was born 4th August 1674. He possessed excellent talents, and acquired knowledge with rapidity, but his tutor, Dubois, afterwards cardinal, early demoralised him by ministering to his passions, and, hardly yet grown up, he gave himself up to debauchery. The king compelled him to marry Mademoiselle de Blois, his daughter by Madame de Montespan. The young

prince now began to alarm the court by an unsuspected capacity for war, showed courage at Steenkirk and Neerwinden, and commanded with success in Italy and Spain. But his presence in Madrid after his victories was disliked both by Philip V. and by Louis XIV. For some years thereafter he lived in complete exile from the court, spending his time by turns in profligacy, the practice of the fine arts, and the study of chemistry. Louis, having legitimised his sons the Duke of Maine and the Count of Toulouse, appointed the Duke of Orleans president of the regency only and not regent, giving the guardianship of his grandson and heir and the command of the household troops to the Duke of Maine; but this arrangement was set aside at his death (1715), and the Duke of Orleans became sole regent. He was popular, and his first measures increased his popularity; but the financial affairs of the kingdom were perplexing, and the regent's adoption of the schemes of Law led to disastrous results. He favoured an English and anti-Spanish alliance, and Anglomania, or a craze for everything English, was one of the features of his régime. His alliance with England and Holland, formed in 1717, was joined next year by the emperor, and this quadruple alliance succeeded in effecting the downfall of Alberoni and his wildly-ambitious schemes. At the instance of Lord Stair, the English ambassador, he expelled the Pretender from France. He put an end to the parliament of Paris meddling with financial or political affairs, and declared the legitimised sons of Louis XIV. incapable of succeeding to the throne. Dubois now became prime-minister, and ere long Archbishop of Cambrai and cardinal. To appease the Jesuits he sacrificed the Jansenists, compelling the parliament in 1722 to recognise the bull *Unigenitus*. Yet he was faithful to his trust, and the indolent young prince on his coming of age (1723) rewarded him by retaining him in power. But Dubois died in the August of the same year, and four months later, Philippe's frame gave way under the burden of his debaucheries, 2d December 1723. See the works by Piossens (5 vols. 1749) and Capefigue (2 vols. 1838).

LOUIS-PHILIPPE JOSEPH, DUKE OF ORLEANS, the famous *Égalité*, was born April 13, 1747, and succeeded to the title on his father's death in 1785, having been Duke of Chartres since 1752. He possessed good abilities, but early fell into a course of debauchery which he never quitted till the end of his career. In 1769 he married the heiress of the Duke of Penthièvre, and used her immense wealth to advance his political interest. But he was looked upon coldly at court, and still more so after the accession of Louis XVI. (1774), who abhorred his morals, while Marie Antoinette grudged him his wealth and independent position and hated the criticisms of the ring of witty reprobates who clustered round him. He fought at Ushant, but was prevented from further service and promotion to the rank of admiral by the jealousy of the court. He visited London frequently, became an intimate friend of the dissipated young Prince of Wales, afterwards inglorious as George IV., and infected young France with Anglomania in the form of horseracing and hard drinking. He made himself widely popular by profuse charity and by flinging open to the poor the splendid gardens of the Palais Royal. In the *lit de justice* of November 1787 he showed his liberalism boldly against the king, and was sent by a *lettre-de-cachet* to his château of Villers-Cotterets. As the States-general drew near he lavished his wealth in disseminating throughout France books and papers by Sieyès and other advocates of liberal ideas, and had himself put up in as many as five *bailliages*, but was elected in but three, Crèpy-le-Valois, Villers-Cotterets, and

Paris. In October (1788) he promulgated his *Délibérations*, written by Lacroix, to the effect that the *tiers état* was the nation, and in June 1789 he led the forty-seven nobles who seceded from their own order to join it. There is no doubt that, guided by Adrien Duport and others, he dreamed of some day becoming constitutional king of France, or at least regent, but it is no less certain that the indolent debauchee was to a great extent the mere dupe of a party, and at no time the deep designing villain he was believed to be at court. There the blame of everything was cast upon his head, even of such great outbursts of the revolutionary fever as the fall of the Bastille and the march of the women on Versailles. Orleans gradually lost influence, and felt so hopeless of the Revolution that he would willingly have gone to America had his mistress, the abandoned Comtesse de Buffon, consented to accompany him. From October 1789 to July 1790 he was absent in England on a mission, and after his return he took a smaller share in political matters than before, while his efforts to come to an understanding with the court were still met with repulse. In September 1792 all hereditary titles being swept away, he demanded a new name from the Paris electors, and adopted that of Philippe Egalité, suggested by Manuel. He was elected the twentieth deputy for Paris to the Convention, and gave his vote of death for the king, which sent a shudder to the heart even of the Mountain. His eldest son, the Duke of Chartres, afterwards King Louis-Philippe, was a brave and active officer on the staff of Dumouriez, and rode over with his chief into the Austrian camp. Egalité was at once arrested with all the Bourbons still in France, and, after six months' duration at Marseilles, was brought to Paris for trial. He was found guilty of royalism and conspiracy and guillotined the same day, 6th November 1793, dying with courteous phrases on his lips and all the high courage of the old régime.

See *Baschet's Histoire de Philippe Egalité*, the elaborate work by Tournou (2 vols. 1840-43), and Mrs Elliot's *Journal* (1859).

Orloff, a Russian family that first rose to eminence during the reign of Paul III., when one of its members, Gregory (1734-83), attracted the notice of the Grand-duchess Catharine, afterwards the Empress Catharine II., and succeeded Poniatowski as her favourite. It was this man who planned the murder of Peter III., and his brother Alexis (1737-1809) who committed the deed (1762). Both brothers were men of gigantic stature and herculean strength. The family of the Counts Bobrinski resulted from Gregory's intercourse with the empress. The legitimate line of Orloff soon became extinct; but Feodor, a brother of Gregory and Alexis, left four illegitimate sons, one of whom, Alexis (1787-1861), signalled himself during the French wars and in Turkey, negotiated the treaties of Adrianople (1829) and Unkiar-Skelessi (1833), and represented Russia at the London conference of 1832 on the affairs of Belgium and Holland. In 1844 he was placed at the head of the secret police, and stood high in favour with the Emperor Nicholas, who employed him in the negotiations with Austria previous to the Crimean war. In 1856 he sat in the congress of Paris as the representative of Russia, and on his return was made president of the grand council of the empire and president of the committee for the enfranchisement of the serfs.—For the Orloff diamond, see DIAMOND.

Ormer. See HALIOTIS.

Ormerod, ELEANOR A., entomologist, the daughter of George Ormerod (1785-1873), the historian of Cheshire. She commenced her contributions to the science of entomology in 1868

in connection with the Bethnal Green Museum. In 1880 she edited the *Cobham Journals*, being the meteorological and other observations made during forty years by Miss C. Molesworth, and involving enormous labour in the consultation of 75,000 observations. In 1882 Miss Ormerod was appointed consulting entomologist of the Royal Agricultural Society, and shortly afterwards became special lecturer on economic entomology at the Royal Agricultural College, Cirencester. Her *Manual of Injurious Insects* (1881) and her *Guide to Methods of Insect Life* (1884) are the most generally interesting of her works, which consist principally of papers on different injurious insects of South Africa and Australia, as well as of England.

Ormolu, a name sometimes given to brass of a golden yellow colour.

Ormonde, an old name for what became afterwards East Munster, comprising Tipperary.

Ormonde, JAMES BUTLER, DUKE OF, was the first of the ancient Anglo-Irish family of Butler on whom the ducal title was conferred. The family was of illustrious antiquity. In the beginning of the 13th century Theobald Butler, from whom the Duke of Ormonde was descended, held the hereditary office of royal cupbearer or *butler* of Ireland. The subject of the present article was born in London in 1610. His father, the son of the celebrated Walter, Earl of Ormonde, was drowned in crossing the Channel; and the old earl having incurred the displeasure of the king, James I., and being thrown into prison, James, who on his father's death became, as Viscount Thurles, the heir of the title, was taken possession of as a royal ward, and placed under the guardianship of the Archbishop of Canterbury. On the restoration of his grandfather to liberty, he also was released; and in his twentieth year he married his cousin, Lady Elizabeth Preston, and in 1632 succeeded, upon his grandfather's death, to the earldom and estates of Ormonde. During the Strafford administration in Ireland Ormonde distinguished himself so much that on Strafford's recall he recommended him to the king; and in the rebellion of 1640 Ormonde was appointed to the chief command of the army. During the troubled times which followed he conducted himself with undoubted ability, although, as a necessary consequence of the numberless divisions and subdivisions of party which then prevailed in Ireland, he failed to satisfy any one of the conflicting sections; and when, in 1643, he concluded an armistice, his policy was loudly condemned as well by the friends as by the enemies of the royalist party in England. During the long contest of Charles with the Parliament, Ormonde continued to uphold the royal interest in his Irish government; and when the last crisis of the king's fortunes came, he resigned his Irish command, and retired to France, from which country he again returned to Ireland with the all but desperate design of restoring the royal authority. After a gallant but unequal struggle, he was, however, compelled, in 1650, to return to France. His services to the royal cause continued unremitting during his exile; and at the Restoration he accompanied Charles II. on his return, and was rewarded for his fidelity by the ducal title of Ormonde. His after-life was less eventful, although he twice again returned to the government of Ireland. It was in 1679 that the well-known attempt was made by the notorious Colonel Blood (q.v.) upon the life of Ormonde. As he was returning from a civic festival, he was attacked by Blood and a party of ruffians, and was dragged from his coach with the intention of his being hanged at Tyburn. The attempt drew additional interest from its being

commonly supposed to have been instigated by the profligate Duke of Buckingham, Ormonde's inveterate foe. He escaped uninjured, and lived until the year 1688. As a soldier he exhibited both skill and bravery in command; and as a politician he was singularly upright in a period when there were many opportunities for the trimmer and the charlatan. His letters and other papers are full of deep historical interest. See Carte's *Life of Ormonde* (1735-36).

JAMES BUTLER, second Duke of Ormonde, was the grandson of the foregoing. He was born in Dublin in 1665, and when ten years of age was sent to France for his education, whence he returned after a few years, and was entered at Christ Church, Oxford. In 1682 he married Anne, daughter of Lord Hyde, afterwards Earl of Rochester. As Earl of Ossory he served in the army against Monmouth, and also held an office in the palace under James II. After his accession to the dukedom by the death of his grandfather in 1688, he took his share in the Revolution conflict, at first being for moderate measures; but he must have seen the futility of these, for afterwards, at the coronation of William and Mary, he acted as lord high-constable. He was present at the battle of the Boyne, at the head of William's life-guards. He soon became popular. In 1702 he was placed in command in the expedition against Cadiz; in 1703 he was appointed lord-lieutenant of Ireland, and in 1711 commander-in-chief of the land forces sent against France and Spain. After the accession of George I. Ormonde somehow fell into disgrace with the king, and was impeached in 1715 of high-treason, with the result that his estates were attainted, and he was deprived of all his honours. He retired into France, where he attached himself to the Jacobite court, and spent many years in the secret intrigues of the Pretender and his followers. He died abroad in 1746. A collection of letters written by him in the organisation of the abortive attempt by Spain to invade England and Scotland in 1719, and which led to the affair of Glenshiel (q.v.), were in 1890 brought to light, and in the following year prepared for publication in the issues of the Scottish History Society.

Ormskirk, a market-town of Lancashire, 12 miles NNE. of Liverpool. It has a grammar-school (1612); a parish church, with embattled tower and spire, and the burial-vault of the Earls of Derby; and manufactures of cordage, iron, silk, cotton, &c. Pop. (1851) 6183; (1881) 6651.

Ormulum, a Transition-English metrical translation of the gospel history. See ENGLISH LITERATURE, Vol. IV. p. 367, and the edition of the Ormulum by White and Holt (2d ed. 1878).

Ormuz, or **HORMUZ**, a small town on the island of Jerun (12 miles in circuit), in the strait of Ormuz, at the entrance of the Persian Gulf, 4 miles S. of the Persian coast. Three centuries before the Christian era there existed on the mainland, 12 miles east of the island, a city Ormuz; this in the 13th century was the headquarters of the Persian trade with India. But about the end of the century its ruler transferred his people to the site of the present town, to escape the Mongols. The new city maintained its commercial supremacy even after it passed into the hands of the Portuguese, through Albuquerque's capture of it in 1507. It was taken from the Portuguese in 1622 by an English fleet (Baffin, the Arctic navigator, being killed in the action), and given to Shah Abbas of Persia, who transferred the trade to his port of Bandar Abbas, 12 miles north-west on the mainland. The Portuguese fort still stands, but the town of Ormuz is a ruin. The island yields salt and sulphur.

Ormuzd (*Ahurā-Mazdā*), the name of the supreme deity of the ancient Persians, and of their descendants the Guebres and Parsees. It was at first emphatically employed in this sense by Zoroaster. See ZOROASTER.

Orne, a department of France formed out of the old provinces of Normandy, Alençon, and Perche; is separated from the English Channel on the W. by La Manche and on the N. by Calvados. Area, 2353 sq. m.; pop. (1861) 423,350; (1886) 367,248. A range of wooded hills, nowhere rising above 1370 feet, extends across the south of the department from east to west, separating the streams that flow north to the English Channel from those that go south to the Seine and Loire. Although the soil is fertile, agriculture is not in an advanced state. Apple and pear trees abound, and more than 22,000,000 gallons of cider are made every year. Cattle and horses of the purest Norman breed are reared. There are cotton and hemp spinning and cotton and linen weaving, dyeing, bleaching, and manufactures of gloves, iron, glass, &c. Fishing and bee-keeping are carried on. The department is divided into four arrondissements, Alençon, Argentan, Domfront, and Mortagne; capital, Alençon.

Ornithology, that branch of zoology of which the subject is Birds (q.v.).

Ornithorhynchus, or **DUCKMOLE** (also called Duck-billed Platypus, the 'water-mole' of colonials), one of the lowest mammals, found in the rivers of Australia and Tasmania. Along with the Porcupine Ant-eater (*Echidna*, q.v.) and a neighbour genus, the duckmole is included in the sub-class Prototheria or Ornithodelphia, co-extensive with the order Monotremata. These three genera are of great interest as 'living fossils,' retaining the ancient characters of primitive mammals.

The duckmole, represented by a single species (*Ornithorhynchus paradoxus* or *anatinus*), is a flat animal, between a foot and 18 inches in length,

Fig. 1.—*Ornithorhynchus paradoxus*.

not including the broad beaver-like tail, which measures 4-5 inches. The thick, soft fur is dark-brown above, rusty yellow below. The very short legs have webbed digits in adaptation to the swimming habits, and are also equipped with strong claws, utilised in burrowing. The 'duck-bill' is due to the anterior expansion of the premaxillæ and mandibles, is covered with a horny sheath, bears the nostrils far forward, and is provided with curious tactile structures. Behind the 'bill' is a loose, naked, sensitive collar. The eyes are very small, and there are no external ears. Within the mouth true teeth are present only in the earliest stages; their place is taken in the adults by eight horny plates, sharp-edged in front, broadened out behind. The tongue is not extensible. In the young of both sexes a curious perforated spur, associated with a gland, occurs near the heel, but

this only persists in the males, which are further distinguished in being somewhat larger than their mates. The body temperature is peculiarly low. The voice resembles the growl of a small puppy. No fossil forms are known.

This lowly mammal is essentially aquatic, living in rivers and 'ponds,' swimming and diving admirably. It is lively and active, diving when alarmed, and able to remain several minutes under water.

Fig. 2.
Ornithorhynchus asleep.

It constructs on the bank elaborate burrows (sometimes 20 to 50 feet in length) with two entrances — one above, the other under water. Like many other defenceless animals, it is most active in the twilight. It grubs in the mud for worms, water-insects, molluscs, &c., which it

can temporarily stow away in cheek-pouches. When frightened or asleep it often rolls itself up, in hedgehog fashion, into a living ball. It appears to live amicably with the water-rat, but is molested by carnivorous marsupials, and is often wantonly, though fortunately not easily, shot. The eggs—for the discredited oviparous habit has been confirmed—are laid in a rough nest within the burrow. The young appear to use their bills in breaking the tough shell. The animals have a fishy, oily smell. The flesh is eaten by the omnivorous natives, who are said especially to esteem the young forms.

Many of the enigmas about the duckmole's structure and affinities are still unsolved, but there is no doubt that along with its neighbours it links mammals back to reptilian or even amphibian types. It need hardly be stated that it has no close connection with birds. Some of the most important structural characters may be briefly summarised: The bones of the skull fuse and are polished as in birds; the halves of the lower jaw do not unite in front, and have no ascending process; the bones of the ear are in a primitive state. There are important technical peculiarities in the vertebræ, ribs, hip-girdle, &c. Epipubic bones, for instance, occur as in marsupials. The coracoids are remarkable in reaching the sternum, and the breastbone is like that of the lizard and some other reptiles. The brain is smooth, and old fashioned in having a small corpus callosum and large anterior commissure. There is a common cloaca, receiving the rectum and the urino-genital canal. The heart in its structure is like that of birds. The ureters do not open into the neck of the bladder, but farther down into the short urino-genital canal. The left ovary is larger than the right, and the testes are abdominal. The oviducts have no 'fimbriated' upper ends, are separate throughout their course, open into the urino-genital passage, and thence into the cloaca. The vasa deferentia are open separately in the same way, and have only a temporary connection with the penis, which lies attached to the wall of the cloaca. The two milk-glands open on a flat bare patch of skin. As the duckmole is oviparous, there is of course no placenta. The eggs, like those of reptiles, undergo partial segmentation.

From the above it will be seen that the duckmole not only represents the lowest extant stage of mammalian evolution, but preserves, more markedly than the higher forms, traces of the far-off pedigree of the class.

See ECHIDNA, MAMMAL, MARSUPIAL; also Gould's *Mammals of Australia* (3 vols. 1845-63); Huxley's *Vertebrates*, and text-books of Comparative Anatomy;

W. K. Parker's *Mammalian Descent*; Flower's *Osteology of the Mammalia*; Spenser, *Nature*, xxi. (1884-85).

Orobanchææ, or OROBANCHACEÆ, a natural order of parasitical herbs, generally with simple stems clothed with brown, purplish, yellow, or blue, but never green scales, instead of true leaves; terminating in a spike of flowers each in the axil of a scale or bract similar in colour and character to those of the stem. The species known considerably exceed one hundred in number, and are spread over the greater part of the globe, chiefly in temperate climates, but more abundant in the Old World than in the New. Eight species are natives of Britain, seven of which belong to the genus *Orobanche* (Broomrapes), and one species to *Lathræa* (Toothwort). In Britain they are all rather rare or purely local plants. High medicinal virtues formerly were ascribed to some of the species, especially to *Epiphegus virginiana* (see CANCER-ROOT), which are now discredited. With *Phelipæa lutea* the Egyptians dye the ropes made of the palm *Hyphæne thebaica* black.

Orobis, a genus of plants of the natural order Leguminosæ, sub-order Papilionaceæ, allied to Vetches, and sometimes called Bitter Vetch. The species are perennial herbaceous plants, chiefly natives of Europe. They afford good food for cattle. Two are natives of Britain, of which the most common is *O. tuberosus*, whose racemes of purple flowers often adorn heaths and bushy places, especially in hilly districts. Its roots are creeping and swell out into tubers at irregular intervals. The tubers have a sweet taste, resembling that of liquorice, and are sought after by children; they are also bruised and steeped in water in some parts of the Highlands of Scotland to make a fermented liquor, and a kind of liquor is made also by steeping them in whisky; they are well flavoured and nutritious when boiled or roasted, and are used in this way in the Highlands of Scotland, in Holland, Belgium, and other countries.

Bitter Vetch (*Orobis tuberosus*):
a, standard of the corolla.

Orontes, the ancient name of a river in Syria, now called *Nahr-el-Asi*. It rises in the highest part of Cœle-Syria, near Baalbek, flows northward between the mountains of Libanus and Anti-Libanus, as far as the city of Antioch, and then westward to the Mediterranean Sea, through a total course of 147 miles. Its lower course is remarkably beautiful; its rocky banks are 300 feet high, and the windings of the river show them off to the greatest advantage. Myrtles, laurels, figs, wild vines, arbutus, dwarf-oaks, and sycamores grow up the cliffs in picturesque irregularity. The country through which the river flows is in many parts richly cultivated.

Orosius, PAULUS, a Spanish presbyter and historian, was born at Tarragona, and flourished in the 5th century. He visited Augustine in 415, and presented to him his work written against the heresies of Priscillian and Origen. He went thence to Palestine to study under Jerome at Bethlehem. His chief work, the *Historiarum adversus Paganos Libri vii.*, begins with the creation and goes down to 417 A.D. It is apologetic in design, intended as a complement to the great work of Augustine written to prove from historical evidence that the prevailing evils of the time were not due to Christianity. It is based on the chronicle of Eusebius-Jerome, and on Livy, Eutropius, Justin, Tacitus, and Suetonius; but the work is a trivial, inaccurate, uncritical miscellany of facts, although the style is elegant if watery, in Bacon's phrase. It was a favourite text-book of universal history during the middle ages, and had the honour of being translated into Anglo-Saxon by Alfred (ed. by Bosworth in 1851, and by H. Sweet from Lord Tollemache's 9th-century MS. 1883 *et seq.*). Some MSS. bear the puzzling title of *Hormesta* or *Ornista*, conjectured by some to be a corruption of *Or. m. ista*—i.e. *Orosii mundi istoria*, or perhaps *Orosii miseriarum (mundi) istoria*.

The editio princeps appeared at Vienna in 1471; the best edition is that by C. Zangemeister in *Corpus Script. Eccles. Latin.* (Vienna, 1882). The edition of Havercamp (1738) was reprinted in vol. ix. of Galland's *Bib. Pat.* (1773) and vol. xxxi. of Migne's *Patrol.* (1846); the history alone by Dr Brohm (Thorn, 1877). An earlier English translation (1773) was reprinted in Bohn's 'Antiquarian Library' (1853).

Orotava, a town on the north coast of Teneriffe, one of the Canary Islands, is situated below the Peak, in one of the pleasantest districts in the world. Pop. 8293.

Orpheus, a Greek hero, a son of Apollo and the Muse Calliope, or of Egeus and Clio or Polyhymnia. His native country is Thracia, where many different localities were pointed out as his birthplace. Apollo bestows upon him the lyre, which Hermes invented, and by its aid Orpheus moves men and beasts, the birds in the air, the fishes in the deep, the trees, and the rocks. He accompanies the Argonauts in their expedition, and the power of his music wards off all mishaps and disasters, rocking monsters to sleep and stopping cliffs in their downward rush. His wife, Eurydice, is bitten by a serpent and dies. Orpheus follows her into the infernal regions; and so powerful are his 'golden tones' that even stern Pluto and Proserpine are moved to pity, while Tantalus forgets his thirst, Ixion's wheel ceases to revolve, and the Danaids stop in their wearisome task. He is allowed to take her back into the 'light of heaven,' but he must not look around while they ascend. Love or doubt, however, draws his eyes towards her, and she is lost to him for ever. His death is sudden and violent. According to some accounts, it is the thunderbolt of Zeus that cuts him off, because he reveals the divine mysteries; according to others, it is Dionysus, who, angry at his refusing to worship him, causes the Mænads to tear him to pieces, which pieces are collected and buried by the Muses in tearful piety at Leibethra, at the foot of Olympus, where a nightingale sings over his grave. Others, again, make the Thracian women divide his limbs between them, either from excessive madness of unrequited love or from anger at his drawing their husbands away from them. The faint glimmer of historical truth hidden beneath these myths becomes clearer in those records which speak of Orpheus as a divine bard or priest in the service of Zagreus, the Thracian Dionysus, and founder of the Mysteries (q.v.); as the first musician, the first inaugurator of the

rites of expiation and of the Mantic art, the inventor of letters and the heroic metre; of everything, in fact, that was supposed to have contributed to the civilisation and initiation into a more humane worship of the deity among the primitive inhabitants of Thracia and all Greece. A kind of monastic order sprang up in later times, calling itself after him, which combined with a sort of enthusiastic creed about the migration of souls and other mystic doctrines a semi-ascetic life. Abstinence from meat (not from wine), frequent purifications and other expiatory rites, incantations, the wearing of white garments and similar things were among their fundamental rules and ceremonies. But after a brief duration the brotherhood, having first, during the last days of the Roman empire, passed through the stage of conscious and very profitable jugglery, sank into oblivion, together with their 'orphic' formulas and sacrifices.

Orpheus has also given the name to a special literature called the Orphic, and was called the first poet of the heroic age, anterior to both Homer and Hesiod. The fragments current under his name were first collected at the time of the Pisistratids, chiefly by Onomacritus, and these fragments grew under the hands of the Orphic brotherhood, aided by the Pythagoreans, to a vast literature of sacred mythological songs sung at the public games, chanted by the priests at their service, worked out for dramatic and pantomimic purposes by the dramatists, commented upon, philosophised upon, and 'improved' by grammarians, philosophers, and theologians. Although authorities like Herodotus and Aristotle had already combated the supposed antiquity of the so-called Orphic myths and songs of their day, yet the entire enormous Orphic literature which had grown out of them retained its 'ancient' authority, not only with both the Hellenists and the church fathers of the 3d and 4th centuries A.D., but down almost to the last generation, when it was irrefutably proved to be in its main bulk, as far as it has survived, the production of those very 3d and 4th centuries A.D., raised upon a few scanty, primitive snatches. The most remarkable part of the Orphic literature is its Theogony, which is based mainly on that of Hesiod. The story of Orpheus also occurs in English and other mediæval literature.

Besides the fragments of the Theogony which have survived, imbedded chiefly in the writings of the Neoplatonists, are to be mentioned the *Argonautica*, a poem of the Byzantine period, consisting of 1384 hexameters; further, a collection of 87 or 88 liturgical hymns; a work on the virtues of stones, called *Lythica*, &c. Other poems belonging to the Orphic Cycle, of which, however, only names have survived in most instances, are *Sacred Legends*, ascribed to Cercops; a Poem on Nature, called *Physica*, probably by Brontinus; *Bacchica*, supposed to be written by Avignota, the daughter of Pythagoras; *Minyas*, or Orpheus' descent into Hades; and other poetical productions by Zopyrus, Timocles, Nicias, Persinus, Prodicus, &c. The hymns have repeatedly been translated.

See the editions of the *Orphica* by Hermann (1805) and Abel (1885); Lobeck's *Aglaophamus* (1829); and Gerhard, *Orpheus und die Orphiker* (1861).

Orpiment. See ARSENIC.

Orpine, a kind of Sedum (q.v.).

Orpington, a village of Kent, England, 12 miles by rail S.E. of London, where Ruskin's books began to be published in 1873 (see E. T. Cook, *Studies in Ruskin*, 1890). Pop. 3090.

Orrery, a machine constructed for the purpose of exhibiting the motions of the planets round the sun, and of the satellites round their primaries, which was in high repute during the 18th and

beginning of the 19th centuries, though now regarded as a mere toy. Made by Rowley in 1715 at the expense of Charles Boyle (q.v.), Earl of Orrery, it was a combination of the old Planetarium of the 16th century with other machines which showed the motions of the earth, moon, and planetary satellites. Though the construction of a machine which would exhibit accurately the motions, distances, and magnitudes of the planets is impossible, yet an orrery is in some degree useful as giving a general notion of the way in which the planetary motions are performed. As it was a favourite machine at one time, a description of it may not be uninteresting. A number of iron tubes equal in number to the planets, and of different dimensions, are placed one within the other; their lengths being arranged so that the innermost tube projects at both ends beyond the one next to it, that one similarly projects beyond the third, and so on. At one end of each tube a rod is fixed at right angles, and a ball or lamp attached to its end; the lengths of the rods being proportional (or at least supposed to be so) to the radii of the planetary orbits. The other ends of the tubes form the axes of toothed wheels, which are connected, either directly or by means of combinations of toothed wheels, with a winch. The several combinations of wheels are so adjusted that the velocity of revolution of the rods is proportional to the times of revolution of the planets. On turning the winch the whole apparatus is set in motion, and the balls or lamps (representing the planets) revolve round the centre, which is a fixed lamp (representing the sun), at different distances, and with varying velocities.

Orris-root (probably a corruption of *Iris* Root), the root-stock (*rhizome*) of certain species of *Iris* (q.v.), natives of the south of Europe, belonging to the division of the genus having bearded flowers, sword-shaped leaves, and scapes taller than the leaves—viz. *I. florentina*, a species with white flowers; *I. pallida*, which has pale flowers; and *I. germanica*, which has deep purple flowers. The flowers of all these species are fragrant. *I. germanica* extends farther north than the other species, and its root is sometimes said to be more acrid. Orris-root was formerly used in many medicinal preparations as a stimulant, but is now almost entirely disused. It is sometimes chewed to sweeten an offensive breath. Its chief use is in perfumery. It has a pleasant smell of violets, which it acquires in drying. Hair and tooth powders, and oils, are often scented with it. A tincture of it also is used as a scent, and is often sold as *Essence of Violets*.

Orsay. See D'ORSAY.

Orsini, FELICE, conspirator, was born in December 1819, at Meldola, in the States of the Church, and studied at Bologna. He belonged to a branch of a noble family, long famous as supporters of the Guelfic party, which produced famous scholars, soldiers, and churchmen (including two popes, Nicholas III. and Benedict XIII.). Felice, the son of a conspirator, was early initiated into secret societies, and in 1844 was sentenced at Rome to the galleys for life. The amnesty of Pius IX. (1846) restored him to liberty, but he was soon again imprisoned for participation in political plots. When the revolution of 1848 broke out Orsini was elected a deputy to the Roman Constituent Assembly, and, invested with extraordinary powers, was sent to Ancona and Ascoli to suppress brigandage. He signalised himself by the violence with which he executed his commission. He also took part in the defence of Rome and Venice; agitated in Genoa and the duchy of Modena; and in 1853 was shipped by the Sardinian government to England, where he formed close relations with Mazzini. Furnished

with money by the leaders of the revolutionary party, he appeared at Parma in 1854, and afterwards at Milan, Trieste, Vienna, everywhere agitating in the interest of insurrection; until at last he was arrested at Hermannstadt, and confined in the fortress of Mantua. In 1856 he succeeded in making his escape, and found refuge in England, where he supported himself by public lecturing, and wrote *Austrian Dungeons in Italy* (1856). Towards the end of 1857 he repaired to Paris, with the intention of assassinating Napoleon III., whom he reckoned the great obstacle to the progress of revolution in Italy. His associates in this diabolical design were persons named Pieri, Rudio, and Gomez. They took up their station in a house close by the Opera, and on the evening of the 14th January 1858, just as the carriage containing the emperor and empress was drawing up, they threw three bombs under it. An explosion took place, and 10 persons were killed, 156 wounded, but Napoleon and the empress remained unhurt. The assassins were arrested, tried, and sentenced; Orsini, Pieri, and Rudio, to capital punishment, Gomez to penal servitude for life. Rudio's life was spared at the intercession of the empress, but Pieri and Orsini were guillotined on 13th March. See *Memoirs and Adventures of Orsini, written by himself* (Eng. trans. Edin. 1857); his *Letters* (2 vols. Milan, 1861); and a work by Montazio (1862).

Orsova, the name of two towns on the Danube over against the Iron Gates. OLD ORSOVA, a Hungarian place, is 478 miles by rail S.E. of Vienna, and is a station for the Danube steamers. Pop. 3381.—NEW ORSOVA, on the Servian side, is a fortified town held by Austria (since 1878), who also were masters of it between 1716 and 1738; the Turks held it both before 1716 and after 1738. In September 1890 a beginning was made with the removal of the rocky impediments known as the Iron Gates (see DANUBE).

Ortegal, CAPE, the north-west extremity of Spain (q.v.), in Galicia.

Ortelius, the Latin form of the name of ABRAHAM ORTELL, or ORTEL, who, born of German parents in 1527 at Antwerp, where he also died in 1598, published the earliest atlas under the title *Theatrum Orbis Terrarum* (1570); a critical work on ancient geography, *Synonymia Geographica* (1578), re-issued, greatly improved, as *Thesaurus Geographicus* (1596); and other geographical works. He was also a frequent traveller to England, Ireland (1577), and Italy, and the countries between.

Orthez, a town in the French department of Basses-Pyrénées, on the right bank of the Gave de Pau, 41 miles by rail E. of Bayonne. The 'Tour de Moncade' (1240), the stately castle of the counts of Foix (q.v.), which Froissart visited in 1388, was reduced to a ruin by Richelieu. Near Orthez Wellington gained a decisive victory over Soult, 27th February 1814. Pop. 4757.

Orthoceras, a large genus of common fossil Cephalopods. The shells are quite straight, but a gradual series of forms lead on to the Nautilus type. Some species of orthoceras were gigantic; thus, *O. titan* in its fossil state is said to have weighed some tons.

Orthoclase-porphry, a crystalline igneous rock, of variable colour, but generally reddish. It is fine-grained and compact in texture. The ground-mass is felspathic, and micro- or crypto-crystalline; now and again it shows a little glassy or devitrified matter. Scattered through this ground-mass are microscopic crystals of orthoclase, and usually some hornblende and biotite in small

granules, crystals, and scales. The rock is met with amongst Palaeozoic strata, both as contemporaneous lava-flows and as intrusive masses. See also FELSPAR, and IGNEOUS ROCKS.

Orthoclase-rocks. See PETROGRAPHY.

Orthodoxy (Gr. *orthos*, 'right,' and *doxa*, 'an opinion'), a name given by theologians to religious opinions in agreement with Scripture and historical tradition, or rather with the interpretation of these entertained by the particular church to which they themselves happen to belong. While it is true that the great cardinal and essential points of Christian dogma have been preserved by all sections of the Church of Christ, the gravest divergences have also arisen, alike in doctrine and practice, each fortified by an assumed infallible interpretation of the letter of Scripture or the line of historical descent in the usage of the church.—The antithesis of *orthodoxy* is *heterodoxy* (*heteros*, 'other'—i.e. 'wrong,' and *doxa*, 'opinion').

Orthoepy (Gr. *orthos*, 'right;' *epos*, 'a word'), a branch of grammar that treats of the correct pronunciation of the words of a language.

Orthography. See SPELLING.

Orthoptera (Gr., 'straight-winged'), an order of Insects (q.v.).

Ortolan (*Emberiza hortulana*), a species of Bunting (q.v.) of the Finch family Fringillidae. The adult male is about six inches long; has the head, neck, and upper breast slate-gray suffused with yellow; bill reddish brown; chin, throat, and feathers round the eye yellow, with a narrow band of greenish gray descending from a little in

Ortolan (*Emberiza hortulana*).

front of the angle of the mouth; back, wing-coverts and secondaries fulvous brown with dark stripes; rump reddish brown. The plumage of the female is paler in colour. The ortolan in its summer migrations ranges as far north as the Arctic Circle in Scandinavia. In the south of Europe, where it is found in great numbers, and in the north of Africa, where it sometimes breeds, it

is but a summer visitor. In winter it migrates as far south as Abyssinia and North-western India, but its true winter-quarters have not yet been accurately ascertained. Though enormously abundant in certain localities on the Continent, it is rare in Britain, and many of the specimens captured have no doubt escaped from captivity, considering the large quantities imported alive from Holland and Belgium. It frequents bushy places, and builds its nest of dry grass always on the ground and generally in the open fields, though sometimes among herbage or under low bushes. It lays from four to six eggs, which vary in colour from very pale-bluish white to salmon colour, spotted with rich purple brown, with underlying spots of pale violet, not streaked as is usual with other buntings. The note of the male is rather metallic, and his song at times is incessant and very monotonous. The food consists of beetles and other insects and seeds. Large numbers of ortolans are netted during their migrations, and confined in dark or dimly-lighted rooms, where they are fattened upon oats

and millet until ready for the table. Their flesh is considered a great delicacy.

Orton, ARTHUR. See TICHBORNE.

Ortona, a town of Italy, on the Adriatic, 104 miles by rail SSE. of Ancona. It has a cathedral and a recently improved harbour. Pop. 6366.

Ortyx. See VIRGINIAN QUAIL.

Oruro, capital of the department of Oruro, in Bolivia, stands on a saline plain 11,960 feet above the sea, near the salt lake of Aullagas, and possesses mines of silver, gold, and tin. Founded in 1590, it had 70,000 inhabitants in the 17th century, but now has less than 7000.—The *department*, which borders on Peru, has an area of 21,600 sq. m. and a pop. of 111,400. The soil is saline, and far from fertile, but the mineral wealth is great.

Orvieto, a city in the Italian province of Perugia, 78 miles NNW. of Rome, crowns an isolated tufa rock, which rises 765 feet above the river Paglia, and 1327 above sea-level. The cruciform cathedral (1290–1580), one of the most beautiful and richly decorated specimens of Italian Gothic, is built of black and white marble, and measures 295 feet by 109. The façade is unsurpassed in richness of material, and in the beauty of its mosaics, sculptures, and elaborate ornamentation. The interior also is magnificently decorated with sculptures and with paintings by Luca Signorelli, Fra Angelico, &c. The bishop's palace and St Patrick's Well (1527–40), with its 250 steps, are also noteworthy. Pop. 7304. Orvieto, called in the 7th century A.D. *Urbs Vetus*—of which its present name is a corruption—has by some been supposed to occupy the site of the Etruscan Volsinii. In the middle ages it gave shelter to thirty-two popes. See works by Gruner (Leip. 1858), Berir (Lond. 1884), and Piccolomini (Siena, 1885).

Orwell. See IPSWICH.

Oryx, an old name given to several large and heavy African antelopes, with very long, slightly curved horns. One species (*Hippotragus leucoryx*) frequents the deserts of Central Africa, and once extended farther north, as is shown by the frequency of its apparently 'unicorn' figure on ancient monuments. Another form (*H. capensis*) is found in Kaffraria. But the name oryx has been used somewhat widely. See ANTELOPE.

Oryza. See RICE.

Osage Orange (*Maclura aurantiaca*), a tree of the natural order Moraceæ, a native of North America. It attains a height varying, according to soil and situation, from 20 to 60 feet. It is of the same genus with Fustic (q.v.), and its wood, which is bright yellow, probably might be used for dyeing. The wood is fine-grained and very elastic, and takes a high polish; it is much used for fence-posts, sleepers, paving-blocks, &c. The tree is largely employed in America, especially in the west, as a hedge-plant; it has also been introduced into Britain for that purpose, but has not met with general appreciation. Its fruit is about the size of a large orange, has a tuberculated surface of a golden colour, and is filled internally with radiating, somewhat woody fibres, and with a yellow milky juice, the odour of which is generally disliked, so that the fruit, although not unwholesome, is seldom eaten.

Osages, a tribe of American Indians, of the Dakota stock, formerly very troublesome, but now settled in the north of Indian Territory, with Quaker teachers. They number about 1200.

Osaka, or OZAKA, an important city of central Japan, situated at the head of the gulf of the same name, and at the mouth of the Yodo River, which issues from Lake Biwa. The city covers an area of

about 8 sq. m., and is intersected with canals. Its fine castle, the stones of whose walls are of astonishing size, was constructed by Hideyoshi's orders in 1583, and the palace, built afterwards in its precincts and destroyed in 1868, was perhaps the most magnificent structure in Japan. Osaka is the great commercial centre of the empire, and the headquarters of the rice and tea trade. Its port does not admit of the entrance of large vessels. There is a foreign settlement, mostly occupied by missionaries. Pop. (1889) 361,694.

Osborn, SHERARD, admiral and Arctic navigator, was born at Madras, 25th April 1822, the son of an English officer, and entered the navy in 1837. He took part in the capture of Canton (1841), and of the defences of Woo-sung (1842); commanded vessels in two expeditions sent out in 1849 and 1852-55 respectively to search for Sir John Franklin; was head of the division of the British fleet that served in the Sea of Azov during the Crimean war; and took a leading share in the Chinese war of 1857-59, penetrating up the Yang-tze-kiang as far as Hankow. After his retirement from active duty he superintended the construction of a submarine telegraph between Great Britain and Australia, and was made rear-admiral in 1873. He died 6th May 1875. Besides publishing *Stray Leaves from an Arctic Journal* (1852), *Journals of Robert M'Clure* (1856), and *Career, Last Voyage, and Fate of Sir John Franklin* (1860), he proved his interest in Arctic exploration by inducing A. H. Markham to test the navigability of Baffin Bay in winter (1873) by steam-power, and by helping to fit out the expedition which sailed under command of Nares, Markham, and others in 1875.

Osborne House. See COWES.

Osborne or St Helen's Beds. See OLIGOCENE SYSTEM.

Oscans (Lat. *Osci* or *Opaci*; Gr. *Opikoi*), the name of an Italian people, who at an early period occupied Campania, and were either closely allied to or the same race as the Ausones. Subsequently (about 423 B.C.) Samnites from the hilly districts to the north overran the country, and amalgamated with the inhabitants whom they had subjugated; and the names *Osci* and *Oscan language* were subsequently applied to all the other races and dialects whose origin was nearly or wholly the same. The Oscan language was not substantially different from the Latin, but only a ruder and more primitive form of the same central Italic tongue. By the victories of the Romans over the Samnites, and the conferring of the *civitas* on all the Italians (88 B.C.), an end was put to the official use of the Oscan tongue; nevertheless, in the time of Varro (1st century B.C.) it was still used by the people. During its most flourishing period it was something more than a country *patois*; it is even possible that the Oscans had a literature and art of their own (see ATELLANÆ). Besides a considerable number of coins with Oscan legends, there are still extant a number of inscriptions in the Oscan tongue (see INSCRIPTIONS).

See Mommsen's *Oskische Studien* (1845), and *Unterschiedliche Dialekte* (Leip. 1850); Zvetaieff's *Sylloge Inscr. Oscarum* (Petersb. 1878).

Osceola (*As-se-he-ho-lar*, 'Black Drink'), a Seminole chief, was born in Georgia in 1804, the son of an English trader, named Powell, and of a chief's daughter. With her he removed to Florida while a child, and there attained great influence among the Indians. In 1835 his wife, the daughter of a runaway slave, was seized as a slave. The outraged husband threatened revenge, and for his threats was imprisoned six days in irons by General Thompson: six months afterwards he killed the general and four others outside Fort King. This

was the beginning of the second Seminole war. He then placed himself at the head of a band which had surprised and massacred Major Dade and a detachment of soldiers, and taking to the almost impenetrable Everglades, with two or three hundred followers, he fought for nearly two years with great energy and skill the superior numbers sent against him. He was taken prisoner at last, in October 1837, by General Jesup, while holding a conference under a flag of truce—an act of inexcusable treachery, though represented as one of retaliation—and confined in Fort Moultrie until his death, 30th January 1838. Mayne Reid, in *Oceola*, has woven the story into a romance.

Oscott, a Roman Catholic college, near Birmingham, which claims to be the centre of the Roman Catholic movement in England. The name (or *Auscott*, as it is spelt in Camden's *Britannia*) is first met with towards the close of the 17th century as the seat of a Catholic mission, which continued to be served by different priests till in 1752 it was formed into a college for the education of both laymen and ecclesiastics, and called St Mary's College. In 1835 the present fine buildings were erected, and in 1889 the establishment became purely ecclesiastical, no longer admitting lay students. It is now styled St Mary's Seminary, and the curriculum includes a course of higher classics, science, and mathematics, to meet the requirements of the London University B.A. Exam. After this the course consists of two years of mental philosophy and three and a half of theology and kindred subjects. The staff includes a rector, vice-rector, and eight professors, and the seminary is open to students from any British diocese.

O'Shaughnessy, ARTHUR, minor poet, was born in London, 14th March 1846. He was employed in the natural history division of the British Museum, married a daughter of Dr Westland Marston, whom he lost in 1879, and followed to the grave on 31st January 1881. During his brief life he published *Epic of Women* (1871), *The Lays of France* (1872), and *Music and Moonlight* (1874); and soon after his death appeared *Songs of a Worker* (1881). As a poet he is somewhat diffuse, over-gorgeous in colour, and not sufficiently discerning in his admiration for modern French models; yet he reveals imagination, passion, tenderness, melody, and a mastery of lyrical forms.

Oshkosh, capital of Winnebago county, Wisconsin, on both sides of the Fox River, at its entrance to Lake Winnebago, 80 miles by rail NNW. of Milwaukee. The lake (30 miles by 12), with the Fox and Wisconsin rivers, which are connected by a canal, forms a water-route between Lakes Michigan and Superior. The city extends along the lake for 4 miles, and contains a number of handsome buildings. It carries on a great trade in lumber, and contains fifteen sawmills, extensive door and sash factories, and large manufactories of furniture, matches, carriages, and soap, besides pork-packing establishments. It is the seat of a state normal school, and close by is a state lunatic asylum. Oshkosh was incorporated in 1853, and burned down in 1859; it was again partially destroyed by fire in 1874 and 1875, and in 1885 a cyclone overwhelmed part of the suburbs. Pop. (1880) 15,748; (1885) 22,064; (1890) 22,836.

Osiander, ANDREAS, German reformer, was born on 19th December 1498, at Gunzenhausen, near Nuremberg. His name is a Gracised form of the original German Heiligmann or Hosemann. Educated at Ingolstadt, he declared himself an adherent of Luther, and became a preacher at Nuremberg (1522), persuaded that city to declare itself Lutheran, took part in the conference at Marburg (1529), and was present at the diet of

Augsburg (1530), and at the signing of the Schmal-kald articles (1537). In 1548 he was deprived of his office as preacher because he refused to agree to the Augsburg Interim; but was immediately afterwards invited by Albert, Duke of Prussia, to become professor of Theology in the newly-established university of Königsberg. He was hardly settled there when he became entangled in a theological strife that was greatly embittered by his vehement and arrogant temper. In a treatise, *De Lege et Evangelio*, Osiander asserted that the righteousness by which sinners are justified is not to be conceived as a mere justificatory or imputative act on the part of God, but as something inward and subjective, springing in a mystical way from the union of Christ with man. The most notable of his opponents was Martin Chemnitz (q.v.). Osiander's death in the midst of this fierce polemical war, on 17th October 1552, did not check it; the battle was continued by his followers, called Osiandrists, and led by his son-in-law Funk, who was executed for high-treason in 1566, and the entire party was banished from Prussia in 1567. See Lives by Wilken (1844), Möller (1870), and Hase (1879). Osiander's son Lukas (1534-1604) and his son Lukas (1571-1638) won reputations as theologians of note.

Osier, the popular name of those species of Willow (q.v.) which are used chiefly for basket-making and other wickerwork. They are of low bushy growth, few of them ever becoming trees, their branches long and slender; and they are the more valuable in proportion to the length, slenderness, suppleness, and toughness of their branches. The Common Osier (*Salix viminalis*), a common

Common Osier (*Salix viminalis*): a, male catkin; b, female catkin.

native of wet alluvial grounds in Britain and many parts of Europe, is one of those which sometimes become trees, although when cultivated for basket-making it is not permitted to do so. It is often planted to prevent the banks of rivers from being washed away. Its branches are used for making hoops and coarse baskets. There are several varieties in cultivation, not easily distinguished except by a very practised eye, but much more useful than the original or wild kind, which is apt to break, and therefore of little value. More suitable for the finer kinds of basket-making are *Salix forbyana*, sometimes called the Fine Basket Osier, and *S. rubra*, known near London as the Green-leaved Osier or Ornard; *S. triandra*, a triandrous species, known to English osier-cultivators and basket-makers as the Spaniard Rod; whilst *S. vitellina*, a pentandrous species, sometimes becoming a tree, is the Golden Osier or Golden Willow, remarkable for the bright-yellow colour of its branches, as well as for their pliancy and toughness. There are other species, not natives of Britain, which also are valuable.

Osiers are very extensively cultivated in Holland, Belgium, and France, on alluvial soils, especially near the mouths of rivers; and from these countries

great quantities of 'rods' are imported into Britain. They are cultivated also to a considerable extent in some parts of England, particularly on the banks of the Thames and the Severn, and in the level districts of Cambridgeshire, Huntingdonshire, &c. Islets in the Thames and other rivers, entirely planted with osiers, are called *Osier holts*. Osiers grow particularly well on grounds flooded by the tide. Much depends on the closeness of planting of osier grounds; as when space is too abundant the shoots of many of the kinds do not grow up so long, slender, and unbranched as is desirable. The French cultivators, when they wish osiers for the finest kinds of basket-work, cut branches into little bits with a bud or eye in each, and plant these pretty close together, so as to obtain weak but fine shoots; but generally cuttings of 15 or 16 inches in length are used, and of tolerably thick branches, and these are placed in rows from 18 inches to 2 feet apart, and at distances of 15 to 18 inches in the row. Osier plantations in light soils continue productive for fifteen or twenty years, and much longer in rich alluvial soils. Osiers succeed best in rich soils, but not in clays. No cultivation is required after planting; but the shoots are cut once a year, at any time between the fall of the leaf and the rising of the sap in spring. After cutting they are sorted, and those intended for brown baskets are carefully dried and stacked, care being taken that they do not *heat*, to which they are liable, like hay, and by which they would be rotted and rendered worthless. The stacks must be protected carefully from rain. The osiers intended for white baskets cannot at once be peeled, but, after being sorted, they are placed upright in wide shallow trenches, in which there is water to the depth of about four inches, or in rivulets, being kept secure in their upright position by posts and rails; and thus they remain till they begin to bud and blossom in spring, which they do as if they remained on the parent plant, sending forth small roots at the same time into the water. They are then, in ordinary seasons, easily peeled by drawing them through an instrument called a *break*, but in cold springs it is sometimes necessary to lay them for a while under a quantity of litter. After being peeled, they are stacked, preparatory to sale. See BASKET.

Osiris, greatest of Egyptian gods, is the son of Seb (the Earth—here the father) and Nut (Heaven—the mother). He wedded Isis his sister while they were yet in the womb; was slain by Set, was avenged by his son Horus, and judges the dead in the nether world. The myth is generally interpreted by taking Osiris for the Sun, Set for darkness. Osiris had by Nephthys another son Anubis (i.e. Dusk), who is said to have swallowed his father. Osiris has also been identified with the god Ra, with the Moon, with the Nile, and with the annual sun-period or summer (as against the daily appearing sun). For further discussion of the myth, see ISIS, and works there quoted; also Wiedemann, *Die Religion der Alten Ägypter* (1890).

Oskaloosa, capital of Mahaska county, Iowa, 104 miles by rail WNW. of Burlington. It possesses mines of bituminous coal, and manufactures flour, woollens, boilers, electric appliances, &c. Here are Penn College (Quaker) and two others. Pop. (1885) 6012; (1890) 7647.

Osmium (sym. Os; atom. wt. 191) is a metal which occurs in association with platinum in the form of an osmium-iridium alloy. It may be obtained in the metallic condition by several processes which yield it either as a black amorphous powder or in hard bluish-white crystals. It is the least fusible of all the metals, the oxyhydrogen jet volatilising, but not fusing it. It is the heaviest

substance known, its specific gravity being 22·477. Four oxides of osmium are known. Three of these—viz. the protoxide, OsO , the sesquioxide, Os_2O_3 , and the binoxide, OsO_2 , are black or grayish-black powders. The peroxide, OsO_4 , commonly called osmic acid, is the most important oxide. It is produced when the metal is heated strongly in air or oxygen, and forms colourless, glistening, acicular crystals, freely soluble in water, and very volatile. At about 100°C . this compound gives off an extremely irritating and irrespirable vapour; and hence the name of the metal (from the Greek word *osmē*, 'odour'). It produces a permanent black stain upon the skin, and at the same time causes an eruption which is difficult to heal. It violently attacks all the mucous membranes, and its vapour may cause partial or total blindness by depositing a film of metallic osmium on the eyes. A solution of the peroxide is employed in histological work for staining fat and nerve substance. Osmium also forms two chlorides; and osmates, corresponding to an unknown osmic acid, have been prepared. This metal was discovered by Tennant in 1803.

Osmose, the interdiffusion of two liquids through a septum, usually of bladder or of parchment paper. If a bottle, filled with one liquid, be closed by parchment paper, and be completely immersed in a vessel containing another liquid, increase or decrease of the contents of the bottle will occur according as the liquid contained in the bottle passes out through the septum less quickly or more quickly than the other liquid passes inwards. When the contents are increased the phenomenon has been called *endosmose*; when they decrease it has been termed *exosmose*. The distinction is obviously not a scientific one; for a reversal of the positions of the liquids will cause a reversal of the osmotic process, so that the process which was formerly denominated exosmose must now be called endosmose, and *vice versa*. The phenomenon is one of extreme importance, for it is constantly taking place in living bodies—both animal and vegetable.

Nollet was the first to record the occurrence of osmose. He placed a vessel, filled with alcohol and closed with a piece of bladder, inside a larger vessel which was filled with water. The rapid entry of the water almost burst the bladder; and the opposite effect took place when the water was placed inside the inner vessel and the alcohol was placed outside it. Nollet did not pursue his observations any further. Dutrochet first made careful investigations into the subject, which has since received numerous practical applications—notably in the method of dialysis, which is due to Graham. The phenomenon consists merely in the interdiffusion of two liquids complicated by the mutual molecular actions which take place between the liquids and the material of the membrane. The rate of interdiffusion depends greatly upon the nature of the membrane; sometimes the direction of the osmose is affected when the membrane is altered. The action being essentially molecular, we can readily understand how sap may be raised to great heights in plants and trees against the action of gravity; for the molecular forces in a drop of water (say) are sufficiently powerful to hold the parts of the drop together against the gravitational attraction of the whole earth.

A process which is analogous to osmose occurs in the interdiffusion of two liquids through an intervening liquid layer. The difference between the rates of diffusion of colloids and crystalloids is even more marked when the substances are separated by parchment paper or animal membrane than when they diffuse directly into each other.

Osmunda. See ROYAL FERN.

Osnabrück, a town in the Prussian province of Hanover, in the fertile valley of the Hase, 75 miles by rail SSW. of Bremen and 70 WSW. of Hanover. Its great Catholic cathedral, in the Transition style of the first half of the 13th century, is rich in relics and monuments; and the town-hall (1486-1512) contains portraits of all the plenipotentiaries who here on 24th October 1648 signed the peace of Westphalia. By that treaty the bishopric of Osnabrück, founded by Charlemagne about 810, was to be occupied alternately by a Catholic prelate and a Protestant secular prince of the House of Brunswick-Lüneburg. After having last been held by Frederick, Duke of York, the district of Osnabrück came in 1802 to Hanover, and the chapter was dissolved, until the re-establishment of the bishopric in 1857. Osnabrück has important iron and steel works, and manufactures of railway plant, agricultural machinery, gas-meters, paper, tobacco, &c. Dating from 772, it suffered much in the Thirty Years' War, but recovered, thanks to its linen industry, during the 18th century. The name *Osnaburgs* given to coarse linens in England is derived hence. Pop. (1852) 13,718; (1875) 29,850; (1885) 35,899, of whom 12,086 were Catholics. See works by Möser, by Frideri and Stüve (1816-26), and by E. Müller (1868).

Osprey (*Pandion haliaëtus*), or FISH-HAWK, a not infrequent autumnal visitor to British shores, estuaries, and lochs, where it feeds exclusively on fish. It has been known to breed in England, and several eyries still remain in Scotland. But its

Osprey (*Pandion haliaëtus*).

distribution is almost cosmopolitan, for it occurs on all the continents, especially where fish are common and men rare. The male bird is 22 inches in length, the female 24. 'The adult male has the head and nape white, streaked with brown; upper plumage umber, with a purplish tinge; under parts white, with a band of brown spots across the breast; cere, legs, and toes greenish blue.' The female has more brown on the breast. A large nest of sticks and turf, with a small moss-lined cavity for the eggs, is built on a tree or rock. The eggs (two or three) are laid in April or May, and have a 'ground colour of white or buff, with chestnut or claret blotches, and blurs of purplish gray.' In North America the osprey is gregarious. It never preys on other birds, and is not dreaded by them. It is, indeed, of a pacific and timorous disposition, and readily abandons its prey to the White-headed Eagle. In the days of falconry it was sometimes trained and used for catching fish. See Howard Saunders, *British Birds*.

Osrhoene, a district in the north-west of Mesopotamia, containing Edessa (q.v.).

Ossa, the ancient name of a mountain on the east side of Thessaly, near Pelion (q.v.), and separated from Olympus by the vale of Tempe. The ancients placed the seat of the Centaurs and Giants in the neighbourhood of Pelion and Ossa. See TITANS.

Ossetes. See CAUCASUS.

Ossian, the great heroic poet of the Gael. In form the name is a diminutive—*Oisean*, *Oisin*, the little *os* or deer. In Gaelic story Ossian was the son of Fionn MacCumhail, a celebrated hero who flourished in the 3d century A.D. Fionn gathered about him a band of warriors like himself, who were collectively termed the *Feinn*. The adventures and exploits of these heroes, and especially of the principal figures in the group—of Fionn himself, magnanimous and wise; of his grandson Oscar, chivalrous and daring; of his nephew Diarmad, handsome and brave; of his rival Goll, the one-eyed; and Conan, the villain of the band—their jealousies, dissensions, and final overthrow constitute the literature of the *Feinn*. The story goes that Ossian was carried away by his fairy hind-mother to *Eilean na h-Oige*, 'the isle of the ever young,' from whence he returned betimes; and now old, blind, and alone, 'Ossian after the *Feinn*,' he told the story of the heroes to St Patrick.

The legends of the *Feinn* are but a fragment of the heroic literature of the Gael, and in the oldest MSS. the deeds of Fionn and his companions occupy but little space. There were two earlier cycles. The first of these extended from unknown antiquity until the settlement of the Gael in Ireland. The legends of this period preserve traditions of the old divinities of the race, notably the *Tuatha de Danann*, under the guise of earlier colonists whom the Gael conquered and displaced. Several tales of this cycle are preserved, among which the Fate of the Children of Tuirenn and the Fate of the Children of Lir are the best known. The second, and by far the richest, epoch in Gaelic romance is that of Cuchullin, Conall Cearnach, Fergus, and the Sons of Uisneach. The date is about the commencement of the Christian era, when Conchobar MacNessa ruled Ulster and Queen Meave ruled Connaught. The great literary product of this period is the *Tain* or Cattle Spoil of Cuailgne, the Iliad of the Gael. Another noted Saga recounts the death of the Sons of Uisneach and suicide of the Lady Deirdre, the Darthula of James Macpherson. Eventually the legends of the *Feinn* partly absorbed and totally eclipsed the earlier traditions; so that Ossianic literature is now but another name for the heroic literature of the Gael.

These traditions have come down from the misty past in tale and ballad. They were early reduced to writing, and as time goes on we observe great development in incident and detail. In ballads preserved in the Book of Leinster (circa 1150 A.D.) Ossian is represented as old and blind, surviving father and son. A 15th-century MS. recounts the boyish exploits of Fionn. As we come down, the volume of tradition gets fuller, while cycles tend to become confused. The leader of the *Feinn* is at one time a god, at others a hero, a king, a giant, but usually a great warrior, as wise as brave. In the book of the Dun Cow his mother is Muir 'of the Fair Neck'; in later traditions we hear of Fionn as the son of a sister of Cuchullin; at another time a Scandinavian princess is his mother. But the literary form in which the legends are preserved remains practically unchanged. A Gaelic tale is of a distinct type—narrative prose with verse interspersed. Gaelic poetry, older and later, is ever rhymed lyric verse.

To the majority of people Ossian is known through the publications of James Macpherson (q.v.). In 1760–62–63 this remarkable man published *Fingal*, an epic poem, in six books; *Temora*, another epic, in eight books; with a number of shorter pieces, epic and dramatic—all purporting to be translations of poems composed by Ossian, the son of Fingal. 'The translation,' Dr Blair is made to say in the preface to the *Fragments* printed in 1760, 'is extremely literal.' These publications, in the opinion of the most competent judges, possessed great literary merit. They brought wealth and fame to the author, and before the end of the century a translation of them appeared in nearly every European language. Encouraged by the success that attended Macpherson's venture, other publications of a somewhat similar kind followed. In 1780 Dr Smith of Campbeltown issued a volume of *Sean Dana*, or ancient poems, 'composed by Ossian, Orran, Ullin,' &c.; and in 1787 Baron Edmund de Harold, an Irishman in the service of the Elector Palatine, printed at Düsseldorf seventeen so-called Ossianic poems in English. The genuineness of Macpherson's *Ossian* was early called in question by Dr Johnson and others. An angry controversy followed. It was maintained that Macpherson had jumbled together persons and periods to an unwarrantable extent; that his originals, so far as he had any, were not Scottish, but Irish. If this were all that could be said one would feel justified in regarding, with Professor Windisch of Leipzig, Macpherson's *Ossian* as a legitimate development of the old traditions. For the legends of the *Feinn* are the common property of the Gael, whether in Ireland, Scotland, or Man. They are located in Scottish topography time out of mind, and within the last four hundred years quite as rich a harvest of ballad and tale has been recovered in Scotland as in Ireland. It is no doubt absurd to represent Fionn, whom Macpherson after Barbour calls Fingal, as a mighty Caledonian monarch, at one time successfully fighting the Roman legions in the 3d century, at another assisting Cuchullin, who lived in the beginning of the 1st century, to expel from Ireland the Norsemen who made their appearance for the first time in the end of the 8th. But Macpherson had warrant in genuine tradition for mixing up names and epochs. In the 'Battle of Ventry' Fionn defeats the kings of the world. According to a Gaelic tale, his father Cumhal sets up as king of Alba, and the kings of Ireland and Scandinavia combine to effect his overthrow; while the son is ever fighting Norsemen. Zimmer has propounded the theory that the whole of these *Finnsage* are in their origin traceable to Teutonic sources, the very names by which the hero and his band are known being borrowed from the Norse. *Find*, *finn*, Fionn this distinguished Celtic scholar regards as a translation of *hvitr*, 'white'; while *finn*, *feinn* are merely *fjanda*, 'foe,' later 'fiend.' Again, in genuine Gaelic ballad Fionn and Cuchullin are not directly brought together, but we find *Garbh* or the Rough, son of Starno, now fighting the latter hero, and again opposed to *Caoilte*, a distinguished companion of the former. According to some spirited verses composed in Perthshire before James Macpherson was born, the tailor of the *Feinn* passes, in the exercise of his calling, from the house of Goll to Dundalgan, the abode of Cuchullin, and back again to the palace of Fionn, without the least consciousness of anachronism.

But in Macpherson's *Ossian* there is a wide departure from genuine Gaelic literature and tradition. In his magnifying of the past, in his sympathy with nature, and in his powerful descriptions of the scenery of his own mountain-land James Macpherson is true to the genius of his

people. But there he parts company with it. Gaelic literature supplies material for epics and dramas; but the epic and dramatic, as literary forms, were unknown to the people. The dim and shadowy characters of Macpherson are in sharp contrast to the clear-cut features of the Gaelic heroes. Rarely does this author make a definite statement of fact; but when he does, as when, for example, he arms the old Gaels with bows and arrows, he blunders hopelessly. Macpherson is the most vague and abstract of writers; Gaelic poets are wearisome in detail, and revel in the concrete. In the opening of Book iii. of *Cathloda*, the author inquires regarding the origin and issue of things; but he is indebted for his answer rather to Bishop Berkeley than to the son of Fionn.

Macpherson was not a Gaelic scholar, and the fact is considered conclusive proof of his inability to compose the Gaelic text of *Ossian*. The only Gaelic printed in the author's lifetime was *Temora*, Book vii. *Ossian* was published in all the languages of Europe before he appeared in his own. And when at length the great edition of 1807 did appear, there were Gaelic texts for only one-half of the poems, and for about three-fourths of the matter published by Macpherson in English forty-five years previously. For the others, no 'original,' ancient or modern, has ever yet been found. And it must be allowed that this truncated *Ossian* does not show to advantage in his native garb. The Gaelic-speaking people have never known him. There is not a single line of these Gaelic texts which can be proved to have been committed to writing before Macpherson's day. The diction is essentially modern. The loan-words are numerous, several of them borrowed from English. The idioms and constructions are colourless, and show traces of classical training rather than of the turns of phrase characteristic of native authors. The so-called blank verse in which the poems are written is unknown to Gaelic poetry. The archaic orthography of the seventh book of *Temora* was adduced by Dr Clerk of Kilmallie as proof of the antiquity of the writing. But in his frequent use of the *tenuis* (*c, p, t*), instead of the *medie* (*g, d, b*), Macpherson merely followed Alexander Macdonald, who published his own poems twelve years previously. By the same gifted man he was led into the blunder of making *grian*, 'sun,' a masculine noun, contrary to invariable Gaelic usage, which has the sun as well as the moon of the feminine gender.

The truth seems to be that these so-called translations were essentially the compositions of James Macpherson, and that the Gaelic texts were prepared with or without aid from his friends, but how and when we do not now know. The only man who could explain things died and made no sign. One regrettable consequence of this famous episode in the history of Gaelic literature still remains. To many persons the discrediting of James Macpherson means the blotting out of existence of an extensive and interesting literature—the heroic literature of the Gael.

Ossification, or the formation of bone, takes place in the growth of the normal human skeleton in two distinct ways. The vast majority of the bones are first represented by cartilage, which, by a complicated series of changes, becomes transformed into bone. The bones of the vault of the

cranium and the face, part of the clavicle, and the 'sesamoid' bones occurring in tendons, on the other hand, are developed from fibrous tissue, without passing through a cartilaginous stage, and are distinguished as *membrane-bones*. In the larger bones of the limbs at least three *centres of ossification* are found, one in the shaft, and one at each extremity. Growth of the bone takes place mainly at the lines between these elements, which long remain cartilaginous. Bony union becomes complete in each situation at a tolerably definite age (in some not till about twenty-five; see BONE). *True Ossification* sometimes occurs as a morbid process; but in many cases the term is incorrectly used (especially in the case of blood-vessels—see under ARTERIES) to designate a hard calcareous deposit, better called *calcification*, or *calcareous degeneration*, in which the characteristic microscopic appearances of true bone are absent. In one sense the osseous tissue that is formed in regeneration of destroyed or fractured bones (see FRACTURES) may be regarded as due to a morbid, although a restorative action. Hypertrophy of bone is by no means rare, being sometimes local, forming a protuberance on the external surface, in which case it is termed an *exostosis*; and sometimes extending over the whole bone or over several bones, giving rise to the condition known as *hyperostosis*. Again, true osseous tissue occasionally occurs in parts in which, in the normal condition, no bone existed, as in the dura mater, in the so-called permanent cartilages (as those of the larynx, ribs, &c.), in the tendons of certain muscles, and in some forms of tumours. The peculiar causes of the osseous formations which are unconnected with bone are not known.

Ossoli. See FULLER (SARAH MARGARET).

Ossory, a diocese of the Roman Catholic Church of Ireland, embraces the county of Kilkenny and parts of King's and Queen's Counties. The bishop has his cathedral at Kilkenny. There is an Ossory parliamentary division in Queen's County.

Ostade, ADRIAN, painter and engraver, was born at Haarlem in December 1610, and in that city he died, 27th April 1685. His teacher was Franz Hals. Country dancing-greens, farm-yards, stables, the interiors of rustic hovels and houses, and beer-shops are the places which he loves to paint; and his persons are for the most part coarse peasants, ugly, sordid, dirty, ragged. Vigour and close observation, with skillful management of lights, are perhaps his most noticeable characteristics; and humour and poetic appreciation are not unfrequently present. About 1639 he fell under the influence of Rembrandt's style. He was a prolific painter, and his works are to be found in the museums and collections of the Netherlands, Germany, Austria, Russia, France, and England. See a work by Bode (Vienna, 1881).—ISAAC OSTADE, brother of Adrian, also a painter, was born at Haarlem in 1621, and died at Amsterdam in 1649. Until 1644 he worked in the style of his brother, but then struck out a path for himself, and excelled in roadside scenes, winter landscapes, village street life, and similar subjects.

Ostashkoff, a town of Russia, stands on the south-east of Lake Seliger, 107 miles W. by N. of Tver. It is one of the chief centres in Russia for the making of boots and shoes. Pop. 9905.

Ostend, a fashionable watering-place in the Belgian province of West Flanders, on the German Ocean, 77 miles by rail WNW. of Brussels. Its *Digue*, or sea-wall, 3 miles long, 40 feet high, and 35 yards broad, forms a favourite promenade, as also do the two *Estacades*, or wooden piers, projecting on both sides of the harbour's entrance. Two spacious floating basins for the Dover mail-

packets (a four hours' passage) were completed in 1874; and as a station also for London steamers, and the terminus of various lines of railway, Ostend is a lively and active place of transport traffic (butter, rabbits, oysters, &c.), and the resort in the season (July to September) of 16,000 to 20,000 visitors from Germany, Russia, and all parts of the Continent. It is, moreover, an important fishing-station, and has a good school of navigation, a handsome Cursaal (1878), a hôtel-de-ville (1711), a fish-market, and a lighthouse (1771; 175 feet). The manufactures include linen, sail-cloth, candles, and tobacco. Pop. (1874) 16,533; (1889) 24,125. Dating from 1072, Ostend is memorable for the protracted siege by the Spaniards which it underwent from 7th July 1601 to 20th September 1604. Twice again it surrendered—to the Allies in 1706, and to the French in 1745. The fortifications have been demolished since 1865.—The 'Ostend Manifesto,' in American history, was a despatch forwarded to the United States government in 1854 by its ministers at the courts of Great Britain, France, and Spain, who had met here, by the government's request, to discuss the Cuban question. The despatch declared that, if Spain would not sell Cuba, self-preservation required the United States to take the island by force, and prevent it from being Africanised like Hayti. Nothing, however, came of the 'manifesto.'

Ostensory. See MONSTRANCE.

Osteolepis (Gr., 'bone-scale'), a genus of fossil ganoid fish peculiar to the Old Red Sandstone. It is characterised by smooth rhomboidal scales, by numerous sharply-pointed teeth, and by

Osteolepis.

having the two dorsal and anal fins alternating with each other. The body is long and slender.

Osteology. See BONE, SKELETON, &c.

Osterode, a town of Hanover, at the western base of the Harz Mountains, on the Söse, an affluent of the Leine, 30 miles by rail NW. of Nordhausen. Its church of St Giles (724; rebuilt 1578) contains the graves of the dukes of Grubenhagen, and there are also a fine town-hall, baths, large grain-stores, and cotton, woollen, and linen factories. Pop. 6435.—**OSTERODE**, in East Prussia, on the Drewenz, 77 miles NE. of Thorn, has a castle of the Teutonic knights (1270) and iron manufactures. Pop. 7123.

Ostia, a city of Latium, at the mouth of the Tiber, 14 miles SW. of Rome. It is said to have been founded by Ancus Martius, and was regarded as the oldest Roman colony. It first acquired importance from its salt-works, and afterwards as the port where the Sicilian, Sardinian, and African corn shipped for Rome was landed; but its name first occurred during the second Punic war. It was long, too, the principal station of the Roman navy; but its harbour was exceedingly bad, and gradually the entrance became silted up, so that vessels were compelled to discharge their cargoes in the open roadstead. At length, towards the middle of the 1st century A.D., the Emperor Claudius dug a new harbour or basin, 2 miles to the north, and connected it with the Tiber by a canal. It was named the *Portus Augusti*, and around it soon sprang up

a new town called *Portus Ostiensis*, *Portus Urbis*, *Portus Romæ*, and often simply *Portus*. Yet it was not till nearly the close of the Roman empire that the prosperity of Ostia as a city began to decline. It was, however, a mere ruin in 830, when Gregory IV. founded a village—the modern Ostia—half a mile above the ancient one, whose 100 inhabitants still carry on the manufacture of salt. The ruins of Ostia extend for a mile and a half along the Tiber, and are nearly a mile in breadth. Excavations were commenced in 1783, and have been carried on systematically since 1855. See MITHRAS.

Ostiaks, or **OSTYAKS**, a Ural-Altaic people living along the lower course of the river Ob in western Siberia, where they struggle against chronic poverty, drunkenness, frequently famine, to get a living by fishing and hunting very dirty animals. They dwell in wretched and very dirty huts, eat flesh raw, use bows and arrows, and weapons of bone and stone; and are still in great part heathens. They are decreasing in numbers, and are estimated now at 27,000. Their language belongs to the Finnish division.

Ostmen, or **EASTMEN**. See **NORTHMEN**.

Ostracion. See **COFFER-FISH**.

Ostracism, a right exercised by the people of Athens of banishing for a time any person whose services, rank, or wealth appeared to be dangerous to the liberty of his fellow-citizens, or inconsistent with their political equality. It was not a punishment for any particular crime, but rather a precautionary measure to remove such leaders as were obviously exercising a dangerous ascendancy in the state. Ostracism was introduced by Cleisthenes about the beginning of the 6th century B.C., after the expulsion of the Pisistratide. The people were annually asked by the Prytanes if they wished to exercise this right, and if they did a public assembly (*ecclesia*) was held, and each citizen had opportunity of depositing, in a place appointed for the purpose, a potsherd (*ostrakon*, also 'oyster-shell') or small earthen tablet, on which

was written the name of the person for whose banishment he voted. Six thousand votes were necessary for the banishment of any person; but the greatest men of Athens—Miltiades, Themistocles, Aristides, Cimon, and Alcibiades—were subjected to this treatment. The banishment was at first for ten years, but the period was afterwards restricted to five. Property and civil rights or honours remained unaffected by it. Alcibiades succeeded in obtaining the final abolition of ostracism, of which, however, Plutarch and Aristotle speak as a necessary political expedient, and its utility has been very ably defended in modern times by Grote (*History of Greece*, vol. iv.).

Ostracoda. See **CYPRIS**, **CRUSTACEA**.

Ostrich (*Struthio*), a genus of birds which was once included with the cassowaries, emu, rhea, and apteryx in a distinct order, the *Ratitæ*, but which is probably better regarded as forming a family apart. Fürbringer thus places it; its nearest allies appear to be the rheas of South America. There seem to be two species of ostrich—viz. *Struthio camelus* and *S. molybdophanes*; the differences which distinguish them are not great. The ostrich is the largest existing bird, reaching a height of from six to eight feet. As in the other 'struthious' birds (= *Ratitæ*), the wings are somewhat rudimentary and quite useless as organs of flight; but the bird spreads them out when running, and they appear to act as sails. The breastbone or sternum has no keel—that is, no median ridge to which the great pectoral muscles

in other birds are so largely attached; in the ostrich these pectoral muscles are but slightly developed, which fact is of course in relation to its small wing. The absence of the sternal keel was the chief reason which led to the association of all the struthious birds into one order, and the name of this order—*Ratitæ*—emphasised the character, signifying raft-like, as opposed to *Carinatae* or keeled. The ostrich is now confined to Africa, Arabia, and Syria, but the discovery of its fossil remains in India indicate that it formerly had a much wider range.

The ostrich shuns the presence of man, but is often to be seen in near proximity to herds of zebras, quaggas, giraffes, antelopes, and other quadrupeds. It is gregarious, although the flocks of ostriches are not generally very large. It is polygamous, one

Ostrich (*Struthio camelus*).

male usually appropriating to himself, when he can, from two to seven females, which seem to make their nest in common, scooping a mere hole in the sand for this purpose. Each female is supposed to lay about ten eggs. The eggs are all placed on end in the nest, which often contains a large number, whilst around it eggs are generally to be found scattered on the sand. Concerning these, it has been supposed that they are intended for the food of the young birds before they are able to go in quest of other food; an improbable notion, not supported by evidence. It seems at least as likely that these scattered eggs are laid by females waiting whilst the nest is occupied by another, and that they are lost to the ostriches, and no more regarded. Contrary to a very generally received opinion, the ostrich does not leave her eggs to be hatched entirely by the heat of the sun; nor is it the case, as has been alleged, that the male only incubates. Both parents give their assistance in the task of watching the eggs. The male and female sit alternately on the eggs for six weeks; the cock sitting all the night, but the female helping in the daytime.

The ostrich feeds exclusively on vegetable substances, its food consisting in great part of grasses and their seeds; so that its visits are much dreaded by the cultivators of the soil in the vicinity of its haunts, a flock of ostriches soon playing terrible havoc with a field of corn. The ostrich swallows large stones, as small birds swallow grains of sand, to aid the gizzard in the trituration of the food; and in confinement it has often been known to swallow very indiscriminately whatever came in

the way—pieces of iron, bricks, glass, old shoes, copper coins, &c. Its instincts do not suffice to prevent it from swallowing very unsuitable things; copper coins were fatal in one instance, and a piece of a parasol in another.

The speed of the ostrich, when it first sets out, is supposed to be not less than sixty miles an hour; but it does not seem to be capable of keeping up this speed for a long time. It is successfully hunted by men on horseback, who take advantage of its habit of running in a curve, instead of a straight line, so that the hunter knows how to proceed in order to meet it and get within shot. It is often killed in South Africa by men who envelop themselves in ostrich-skins, and, cleverly imitating the manners of the ostrich, approach it near enough for their purpose, without exciting its alarm, and sometimes kill one after another with their poisoned arrows. The strength of the ostrich is such that it can easily carry two men on its back. Its voice is deep and hollow, not easily distinguished, except by a practised ear, from the roar of the lion; but it more frequently makes a kind of cackling, and, when enraged and striking violently at an adversary, hisses very loudly. The flesh of the ostrich is not unpalatable when it is young, but rank and tough when old. It is generally believed to have been prohibited as unclean to the Jews (Lev. xi. 16), although the name is translated *owl* in the English Bible. There are frequent references to it in the Old Testament.

The eggs of the ostrich, which are white or yellowish white in colour, are much esteemed as an article of food by the rude natives of Africa, and are acceptable even to European travellers and colonists. Each egg weighs about three pounds, and is thus equal to about two dozen ordinary hen's eggs. The egg is usually dressed by being set upright on a fire, and stirred about with a forked stick, inserted through a hole in the upper end. The thick and strong shell is applied to many uses, but particularly is much employed by the South African tribes for water-vessels. The reader will probably recollect the interesting plate in Livingstone's *Travels* of women filling ostrich-shells with water. In taking ostrich-eggs from the nest the South African is careful not to touch any with the hand, but uses a long stick to draw them out, that the birds may not detect the smell of the intruder, in which case they would forsake the nest; whilst otherwise they will return, and lay more eggs. The long plumes of the ostrich have been highly valued for ornamental purposes from very early times, and continue to be a considerable article of commerce (see below; also FEATHERS). The ostrich is often to be seen in Britain in confinement, and readily becomes quite tame and familiar, although still apt to be violent towards strangers. Great numbers were exhibited in the public spectacles by some of the Roman emperors; and the brains of many ostriches were sometimes presented in a single dish, as at the table of Helio-gabalus. See the articles CASSOWARY, EMU, RHEA; also *ÆPYORNIS*, *DINORNIS*.

OSTRICH-FARMING.—Although there were isolated attempts in 1864, the domestication of the ostrich in South Africa, for the sake of its plumage, dates from about 1867, and so rapidly had the industry grown that in 1880 about £8,000,000 of capital was employed, and the value of feathers exported was over £800,000. The French have also made attempts in the same direction in Algiers; feathers are exported from Tripoli; there are tame birds kept in Egypt; while birds have been imported into Australia by the Melbourne Acclimatisation Society, and a shipment was made from Capetown to Buenos Ayres in 1882. Successful experiments in ostrich-farming have also

been made in several places in California. Mr Kin- near of Beaufort-West, and Mr Arthur Douglass of Heatherton Towers, near Grahamstown, were two pioneers in ostrich-farming. Large fortunes were made in the early days of the industry, when feathers were worth £100 per lb., the plumes of one bird sometimes fetching £25. As much as £400 or even £500 have been paid for a good pair of breeding birds, and chicks newly out of the egg have fetched £10 each. As the supply became greater than the demand a pair of ostriches might not bring more than £12, and the plumes of an ostrich about 30s. for one plucking. The beautiful white plumes so highly prized by ladies all over the world grow in the ends of the wings of the male birds. A good bird in his prime will yield from twenty to forty of these, besides a few black feathers also from the wings. The tail-feathers are not nearly so valuable nor so beautiful. The plumes of the hen from her wing-tips are generally spotted and flecked with gray, and are called feminines. From 120 to 130 good feathers go to a pound: they are always thus sold by weight. Ostrich-farmers either may buy the young birds from the breeders when from four to twelve months old, keep them for the sake of their feathers, and sell them as breeding birds when they are four years of age; or they may give their attention to breeding birds only, selling the young as they are hatched or when they are a few months old; or they may breed and farm for themselves. Where artificial incubators are in use the eggs are removed from the nest as soon as laid. Till a year old birds are usually treated as chicks, and fed with 1 lb. each of wheat, barley, or Kafir corn; when the weather is wet they must be put under cover. After this age they may be put in a fenced camp, with ten acres to each bird, and left to shift for themselves. Still, they need to be watched for two years, as they suffer much from parasites. There may be a fortnightly muster, and a stock-book kept, in which the days for cutting and pulling feathers are noted. A five-wire fence is recommended by some breeders, never less than 4 feet 9 inches in height. The 'plucking-box' is a solid wooden box, in which the ostrich has only room to stand. The feathers are cut before the quills are quite ripe; the stumps remain for a month or two, and are then easily pulled out. Formerly the feathers used to be pulled out by the roots. The first crop of good feathers is clipped at seven or eight months; this is repeated every eight months with like result, till the birds take to breeding, after which it is not desirable to deprive them of their feathers, as they require them to cover the eggs on the nest. The bird's plumage has reached perfection when three years old, and at four years the birds have reached maturity. The bony body of the ostrich yields little or no flesh, but the thigh makes delicious soup. The legs are brittle and easily broken, in which case the bird has to be killed. Ostriches may be kept in every part of Cape Colony except in the cold mountainous tablelands, but they thrive best in the extensive Karroo plains, which are their natural habitat, though strong adult birds may thrive in a good grass country. They prefer a dry, warm, well-drained Karroo country, and the wider the range the birds can be allowed the better they thrive. Their best grazing grounds are where the soil is rich in alkalis. In 1885 the export of feathers from the Cape of Good Hope amounted to 232,119 lb., of a value of £900,165; in 1889 to 147,486 lb., of a value of £404,091.

See Mosenthal and Harting's *Ostriches and Ostrich-farming* (1876); Douglass, *Ostrich-farming in South Africa* (1881); Martin's *Home Life on an Ostrich-farm* (1890).

Ostrog, a town of Russia, in Volhynia, 176 miles W. of Kieff. Pop. 16,522, mostly Jews.

Ostrogoths. See GOTHs.

Ostuni, a city of South Italy, 22 miles NW. of Brindisi by rail. Pop. 15,199.

Osuna, a town of Spain, 66 miles by rail ESE. of Seville, stands in a fertile plain on a triangular hill crowned by the castle of the Girons, dukes of Osuna, and by a collegiate church (1534), which was pillaged by Sout of 5 cwt. of ancient church plate. Pop. 17,211.

Oswald, St, king of Northumbria, was the son of the conquering Ethelfrith of Bernicia and of Acha, sister of the brave Edwin of Deira. He fought his way to the throne by the defeat, at Heavenfield near Hexham (635), of Cædwalla the Welsh king who had aided Penda to crush Edwin at Hatfield two years before. Under the reign of Edwin he had found shelter in Scotland, and been converted to Christianity at Hii or Iona; and now, when he was hailed king by the whole of Northumberland, he established Christianity with the help of St Aidan, who settled on Holy Island. Oswald was acknowledged as over-lord by all the kingdoms save those subject to Penda. He fell fighting against his enemy at Maserfield (Oswestry) in 642.

Oswego, a port of entry and capital of Oswego county, New York, is situated at the mouth of Oswego River (here crossed by three bridges), on Lake Ontario, at the extremity of the Oswego Canal (to Syracuse, 35 miles by rail), and 326 miles by rail NW. of New York City. It is a handsome city, with wide streets, and a United States government building, court-house, city hall, state armoury, &c. It is the principal port on the lake, with a breakwater, a dozen large elevators, and 4 miles of wharves, and carries on a brisk trade. The river falls here 34 feet, and the abundant water-power is utilised in flour-mills, knitting-mills, &c. Oswego starch and corn-flour are as well known in Europe as in America. Pop. (1880) 21,116; (1890) 21,842.

Oswego Tea, a name given to several species of *Monarda*, particularly *M. purpurea*, *M. didyma*, and *M. kalmiana*, natives of North America, because of the occasional use of an infusion of the dried leaves as a beverage. They belong to the natural order Labiate, somewhat resemble mints in appearance, and have an agreeable odour. The infusion is said to be useful in intermittents and as a stomachic. Some other species of *Monarda* are used in the same way, and the three species named are not uncommonly cultivated in gardens for ornament.

Oswestry, a thriving market-town and municipal borough (1397) of Shropshire, 18 miles NW. of Shrewsbury. It has an old parish church, restored in 1872 at a cost of £10,000; a fragment of the Norman castle of Walter Fitzalan, progenitor of the royal Stewarts; and a 15th-century grammar-school, rebuilt in 1810 and enlarged in 1863-78. Railway workshops were established in 1865, and sewerage and water works constructed in 1866. Oswestry derives its name from St Oswald (q.v.), who was slain here. In 1644 it was captured by the parliamentarians. Pop. (1851) 4817; (1881) 7847; (1891) 8496. See works by Price (1815) and Cathrall (1855).

Osymandyas, the name of a great king of Egypt, mentioned by Diodorus and Strabo, who reigned, according to these authors, as the 27th successor of Sesostrius. He is said to have distinguished himself by his victories, to have invaded Asia with an army of 400,000 men and 20,000 cavalry, and to have conquered the Bactrians, who had been rendered tributary to Egypt by Sesostrius. In honour of this exploit he is said by Hecataeus to have erected a monument which was at once a palace

and a tomb, and which, under the name of *Osymandeion*, was renowned for its size and splendour in later times. The *Osymandeion* is generally believed to be represented by the extant ruins of the Ramesseum at Medinet Habu (see THEBES), though great difficulty has been felt in reconciling the descriptions of its magnificence in ancient writers with the dimensions of the existing relic. Nor can the name of *Osymandyas* be recognised amongst the Egyptian kings.

Otago, the most southern provincial district of New Zealand, in the South Island. It was one of the original six provinces in the colony, but since 1876 these have been abolished and the county system has been adopted. The name is said to be derived from the Maori *Otakou*, 'red earth.' It was colonised in 1848 by the Otago Association connected with the Free Church of Scotland. It is bounded on the N. by Canterbury and Westland, and on the E. and W. by the sea. It has a coastline of 400 miles, is 160 miles long by 195 broad, the estimated area comprising 15,038,300 acres, of which 9 millions, chiefly in the centre and in the east, are fit for agriculture. Pop. (1880) 138,219; (1889) 158,661. Gold was discovered here in 1861, and now the goldfields comprise an area of 2½ millions of acres, from which gold to the value of £18,000,000 had been exported up till 1888. Dunedin (q.v.) is the capital. See NEW ZEALAND.

Otaheite. See TAHITI.

Otalgia (Gr. *ot-*, 'the ear,' and *algos*, 'pain') is neuralgia of the ear. See EAR.

Otary (*Otaria*), a genus of the Seal family (Phocidae). See SEA-LION.

Otchakoff, a seaport of Russia, stands on the north shore of the estuary of the Dnieper, 38 miles ENE. of Odessa. It occupies the site of the ancient *Alector*, and has beside it the ruins of the once important Greek colony of Olbia. In 1492 the khan of the Crimea built here a strong fortress, which was taken by the Russians under Münnich in 1737, recovered in 1738, and again captured after a long siege by Potemkin in 1788, and definitively annexed by Russia. After it had been bombarded by the Allied fleet in 1855 the Russians demolished the fortifications. In 1887 a ship-canal was opened here, which makes the estuary of the Bug and Dnieper much more easily accessible to large ships. Pop. 6977.

Othman, or **Osman I.**, surnamed *Al-ghazi* ('the conqueror'), the founder of the Ottoman (Turkish) power, was born in Bithynia in 1259, and, on the overthrow of the sultanate of Iconium in 1299 by the Mongols, seized upon a portion of Bithynia. Then he forced the passes of Olympus, took possession of the territory of Nicæa, except the town of that name, and gradually subdued a great part of Asia Minor, and so became the founder of the present Turkish empire. From his name are derived the terms Ottoman and Osmanli as synonyms for the Turks. See TURKEY.

Othman, third calif. See CALIF.

Otho, MARCUS SALVIUS, Roman emperor for the first three months of 69 A.D., was descended from an ancient Etruscan family, and was born in 32 A.D. He was a favourite companion of Nero, who sent him as governor to Lusitania for his refusal to divorce his beautiful wife, Poppæa Sabina. Here he remained ten years, and ruled with wisdom and moderation. He joined Galba in his revolt against Nero (68), but, disappointed in his hope of being proclaimed Galba's successor, marched at the head of a small band of soldiers to the forum, where he was proclaimed emperor, and Galba was slain. Otho was recognised as emperor over all the Roman possessions, with the exception of Germany, where

a large army was stationed under Vitellius, which at once began to march on Italy under the command of the lieutenants Valens and Cæcina. Otho showed vigour in his preparations, but his forces were completely defeated after an obstinately fought battle near Bedriacum. Next day, though things were still far from desperate, Otho set his house in order, and then stabbed himself, 16th April 69.

Otho I., or OTTO THE GREAT, son of the Emperor Henry I. of Germany, was born in 912, and was, on the death of his father in 936, formally crowned king of the Germans. His reign was one succession of eventful and generally triumphant wars, in the course of which he brought many turbulent tribes under subjection, acquired and maintained almost supreme power in Italy, where he imposed laws with equal success on the kings of Lombardy and the popes at Rome, consolidated the disjointed power of the German emperors, and established Christianity at many different points in the Scandinavian and Slavonic lands, which lay beyond the circuit of his own jurisdiction. He died in 973.

Otis, JAMES, American statesman, was born at West Barnstable, Massachusetts, 5th February 1725, graduated at Harvard in 1743, practised law, and became a leader of the Boston bar. He was advocate-general in 1760, when the revenue officers demanded his assistance in obtaining from the superior court general search-warrants allowing them to enter any man's house in quest of smuggled goods. Otis, however, refused, resigned his position, and appeared for the people; and his speech, which took five hours in delivery, produced a great impression—John Adams afterwards declared that 'the child Independence was then and there born.' When the writs were granted, by the direction of the home authorities, in 1761, Otis was elected to the Massachusetts assembly; and he afterwards was prominent in firm resistance to the revenue acts. In 1769 he was savagely beaten by some revenue officers and others, and as a result of a sword-cut on the head he lost his reason. On 23d May 1783 he was killed by lightning. The publication on which his fame chiefly rests is *The Rights of the Colonies Asserted and Proved* (1764), a powerful and fearless defence of their right to control their own public expenditure. See the Life by W. Tudor (Boston, 1823).

Otitis, inflammation of the tympanic cavity of the ear. See EAR.

Otley, a market-town in the West Riding of Yorkshire, on the right bank of the Wharfe, and at the north base of Otley Chevin (925 feet), 10 miles NW. of Leeds. Its church, restored in 1868-69, is mainly Perpendicular, but has fragments of Saxon and Norman work; and there are also a court-house (1875), a mechanics' institute (1869), and a grammar-school (1602). Machine-making is the principal industry, with worsted and leather manufactures. Pop. (1851) 4422; (1881) 6806.

Otocyon. See DOG.

Otoliths. See EAR, Vol. IV. p. 157; FISHES, p. 652.

Otorrhœa, a purulent or muco-purulent discharge from the external ear. See EAR.

Otranto (the ancient *Hydruntum*), a town in the extreme south-east of Italy, 29 miles by rail SE. of Lecce, and on the Strait of Otranto, 45 miles from the coast of Albania on the opposite side. During the later period of the Roman empire, and all through the middle ages, it was the chief port of Italy on the Adriatic, whence passengers took ship for Greece—having in this respect supplanted the famous Brundisium of earlier times; but its port is now in decay. In

1480 it was taken by the Turks. At the present day its castle, which gives the title of Horace Walpole's well-known story, is in the same condition as its port. The town is the seat of an archbishop, and has a cathedral, restored after the siege by the Turks, with fine mosaics and an ancient crypt. Pop. 1893. In the province of Lecce (formerly called Terra di Otranto) many Albanians have long been settled. For the Duke of Otranto, see FOUCHÉ.

Ottawa Rima. See METRE.

Ottawa, one of the largest rivers of British North America, rises nearly 300 miles due north of Ottawa city, flows west to Lake Temiscamingue, some 300 miles, and thence 400 miles south-east, and falls into the St Lawrence by two mouths, which form the island of Montreal. Its drainage basin has an area variously estimated at from 60,000 to 80,000 sq. m. During its course it sometimes contracts to 40 or 50 yards; elsewhere it widens into numerous lakes of considerable size. It is fed by many important tributaries, the chief of which are the Petewawa, Bonnechère, Madawaska, and Rideau on the right, and the Coulange, Gatineau, and Rivières du Lièvre and du Nord on the left side. These, with the Ottawa itself, form the means of transit for perhaps the largest lumber trade in the world. The passage of timber over falls and rapids has been greatly facilitated by the construction of dams and slides. See next article.

Ottawa, the capital of the Dominion of Canada, is situated upon the south bank of the Ottawa

power. The Rideau Canal, which was made in 1827, passes through the centre of the city, and affords connection with the Rideau Lakes, and so with the great lakes beyond. Opposite the city, to the north-east, the Gatineau River joins the Ottawa and affords further lumbering facilities. A few miles to the east, the Du Lièvre River opens up a rich phosphate country, which is being much worked. The industries of Ottawa are mostly connected with lumber. In the winter thousands of men are engaged in cutting timber and drawing it to the streams, and in the spring the freshets carry down to the mills the rafts, on which the men who cut it live and labour during the passage. The cut of timber in the Ottawa Valley in 1889 was estimated at 720,000,000 feet. Flour, iron wares, bricks, leather, and matches are, however, manufactured. The exports of the city in 1889 amounted to \$3,562,518, the imports to \$1,984,928.

The parliamentary buildings, constructed in the Italian Gothic style after 1860, when the Prince of Wales laid the foundation-stone, are placed on a noble bluff on the bank of the Ottawa. These structures, including the handsome library building and the Victoria Tower (180 feet high), cost altogether about \$8,000,000. The residence of the governor-general—an old-fashioned, ugly building, called Rideau Hall—is situated about a mile from the city. The post-office, city hall, banks, and telegraph-offices are all of stone and handsomely built. The churches are numerous, but not splendid in architecture. Ottawa is the place of residence of the bishop of Ontario (Church of England), and of the Roman Catholic bishop of Ottawa, who has a cathedral here. The Roman Catholics have separate schools; the Protestants attend almost universally the public schools. There are a normal school and a collegiate institute, both public, and a very large college conducted by the Oblate Fathers; besides a ladies' college, a musical academy, and an art school. A well-equipped geological museum and the parliamentary library, with 140,000 volumes, add to the educational advantages of the city. There are several hospitals and a variety of homes for the poor. Besides the rivers and canals already mentioned, Ottawa stands on the Canada Pacific Railway, which runs along the north bank of the Ottawa from Montreal and crosses by a bridge into Ottawa; whilst the Grand Trunk Railway and the Canada Atlantic Railway connect the city with the Intercolonial Railway on the east, and with the

Canadian Parliament Buildings, Ottawa—The Main Building.

River, 120 miles from its influx into the St Lawrence at Montreal. The river Ottawa drains a vast stretch of country as far north-west as Lake Nipissing and beyond; all the lumber-products of this district, as well as all the local trade, are carried down to Ottawa, to the point at which the river forms the splendid Chaudière Falls (200 yards wide and 40 feet high). These falls, above which a suspension bridge spans the river, supply the motive-power for the numerous lumber-mills, flour-mills, factories, &c. To the east of the city the river Rideau forms a second fall, which, although inferior to the Chaudière, supplies further motive-

power for the Canada Pacific Transcontinental line. Ottawa is governed by a mayor and corporation. The taxes are high, and the streets, partly owing to the climate, are bad; but the city is generally healthy. The city was begun in the last years of the 18th century by a settler named Wright, of Boston, Massachusetts, who built himself a residence near the Chaudière, and called the village which he founded Hull. Hull now contains 12,000 inhabitants, mainly French-Canadians, engaged in the lumber trade. The southern bank lots, on which Ottawa now stands, were sold by Wright to one Sparks, who took them reluctantly in payment

for labour. In 1823 Colonel By was sent by the British government to survey the Rideau Canal. The construction of the canal (1827) stimulated the settlement, which was called Bytown. In 1854 its name was changed to Ottawa, and the town was created a city. In 1861 the population was 15,000; in 1871, 21,545; in 1881, 27,412; and in 1891 it was estimated at 35,000 (about one-half Roman Catholics); to these may be added about 15,000 in adjoining villages and suburbs. In 1858 Ottawa was chosen as the administrative capital of Canada. The first parliament met here in 1865.

Ottawa. (1) capital of La Salle county, Illinois, at the confluence of the Fox and Illinois rivers, which are here crossed by five bridges, 82 miles by rail WSW. of Chicago. It has a mineral spring rich in bromine and iodine, six glass-furnaces, and manufactures of flour, cutlery, tiles, fireproofing, organs, and pianos. Pop. 9985.—(2) Capital of Franklin county, Kansas, on the Osage River (crossed here by two bridges), 68 miles by rail SW. of Kansas City. It contains a college, a foundry, and railway-shops, and manufactures flour, furniture, carriages, and soap. Pop. 6626.

Otter (*Lutra vulgaris*), an aquatic carnivore in the family Mustelidæ, which also includes the badgers and weasels. It is type of a widely distributed genus with about twenty reputed species, like one another in their diving and swimming powers, in their fish-diet, in the webbing of the feet, and in the brown colour of the short, close fur. In the common species, distributed through Europe and Asia, the body may attain a length of 2½ feet, and the tail half as much; the head is broad and flat, with short, rounded ears; the blunt snout bears lateral slit-like nostrils, closed during diving; the long body is covered with beautiful chestnut fur; the legs are very short, but strong; the feet

Fig. 1.—Otter (*Lutra vulgaris*).

are clawed as well as webbed. The otter lives in a hole by the stream side, and feeds especially on fish, but also on small mammals, birds, frogs, cray-fishes, &c. In strength and agility, keen scent and hearing, and general astuteness it deserves a high rank among mammals. Its life is solitary except at the pairing season in spring, after which the female gives birth to three or four blind young, which she guards with great care till they are able to look after themselves. Being very destructive to fishes, the otter has been much hunted, and is now rare where it once abounded. Izaak Walton gives a lively description of an otter-hunt, and tells us that the 'fish-beast will walk upon land sometimes five or six, or ten miles in a night,' that 'he devours much fish, and kills and spoils much more,' that 'he can smell a fish in the water one hundred yards from him,' that 'his skin is worth ten shillings to make gloves,' while 'his stones are good against the Falling-sickness.' The flesh is

tasty, and, being for practical purposes that of a 'fish,' is allowed during fasts. The young may be tamed and used for fish-catching.

Among the other species the most remarkable is the large *L. sandbachii*, from Demerara and Surinam; while of related genera the most striking is the Sea-otter (*Enhydra lutris*), from the North Pacific. This is a powerful otter, sometimes 4 feet long and 90 lb. in weight, with massive molars, by which it is said to crush molluscs and crabs as well

Fig. 2.—Sea-otter (*Enhydra lutris*).

as fish. Its fur is valuable, and the animal is consequently becoming rare. Steller, who was shipwrecked on Behring Island in the middle of the 18th century, has beautifully pictured the life of this interesting otter, but its habits have now become much more shy and wary, and measures have had to be taken to prevent its extermination. The most common otter of North America is *L. canadensis*, much larger than the European species, and ranging throughout the continent, though rare in settled districts.

Otter-hunting is practised in the early morning, and at a season when all other hunting is drawing to a close. The huntsmen are armed with spears; and the true otter-hound, seen best in the Carlisle pack, is a bold, hardy, rough-coated dog, nearly two feet high at the shoulder. Foxhounds are sometimes used.

Otterburn, a small village in Redesdale, Northumberland, about 16 miles south of the Border, and 32 miles from Newcastle, on the benty uplands a little to the west of which was fought, during the moonlit night of 19th August 1388, what Froissart calls 'the hardest and most obstinate battle that was ever fought.' Of a Scottish army of 50,000 men which had mustered on the Border, the greater part invaded England by Carlisle, while 2000 foot and 300 lancers under the Earls of Douglas, Dunbar, and Moray remained to carry fire and sword through Northumberland and Durham. On the march back, laden with spoil, they lay three days before Newcastle, and in one of the frequent passages of arms that occurred Douglas carried away Hotspur's pennon, and declared that he would plant it on his castle of Dalkeith. 'By God, Earl of Douglas,' said Hotspur, 'you shall not even bear it out of Northumberland.' The Scots marched up Redesdale, and, after failing in an attempt on Otterburn Tower, by the desire of Douglas entrenched themselves on a hill slope near, the exact site of which is somewhat uncertain, in order to give Percy an opportunity of coming to claim his pennon. The chivalrous Hotspur hastened after them with 600 horse and over 8000 foot, and came up while the Scots were at supper, whereupon a desperate hand-to-hand fight at once began. Douglas was greatly overmatched in numbers, and, seeing his men forced back, grasped his ponderous mace in both hands

and hewed a way before him until he was borne down mortally wounded by three spear-thrusts. To some of his kinsmen anxiously asking how he did, Hume of Godscroft tells us the dying hero made answer, 'I do well, dying as my predecessors have done before; not in a bed of languishing sickness, but in the field. These things I require of you as my last petitions: first that ye keep my death close both from our own folk and from the enemy; then that ye suffer not my standard to be lost, or cast down; and last, that ye avenge my death, and bury me at Melrose with my father. If I could hope for these things, I should die with the greater contentment; for long since I heard a prophecy that a dead man should win a field, and I hope in God it shall be I.' Towards morning the Scots gained a complete victory, losing 300 men, while the English lost 1880, and among the prisoners both Hotspur and his brother Ralph. The Scottish ballad of 'Otterburn' is almost as historical as Froissart's glowing narrative; the English 'Ballad of Chevy Chase' is a glorious effort of the imagination, which still stirs a modern reader, as it did Sir Philip Sidney, more than the blast of a trumpet. See Robert White's monograph, *History of the Battle of Otterburn* (1857).

Ottery St Mary, a town of Devonshire, on the river Otter, 11 miles (15 by rail) E. of Exeter. Twice the scene of a great conflagration, in 1767 and 1866, it retains its magnificent collegiate church, a reduced copy of the cathedral of Exeter (q.v.), with the only other transeptal towers in England. Begun about 1260 by Bishop Bronescombe, it is Early English, Decorated, and Perpendicular in style, and was restored by Butterfield in 1849-50. The old King's Grammar-school was demolished in 1884. Alexander Barclay was a priest here; Coleridge (q.v.) was a native; and 'Clavering' in *Pendennis* is Ottery St Mary, the Devonshire residence of Thackeray's stepfather. Silk shoe-laces, handkerchiefs, and Honiton lace are manufactured. Pop. (1881) 3973; (1891) 3855.

Otto. See OTHO.

Otto, or Attar, of Roses is the volatile oil or otto of the petals of some species of rose, obtained by aqueous distillation, and highly prized as a perfume. It is a nearly colourless or light-yellow crystalline solid at temperatures below 80° F., liquefying a little above that temperature. It is imported from the East, where in the Balkan Peninsula, Syria, Persia, and India roses are cultivated to a considerable extent for its sake. It is probable that the oriental otto is the produce of more than one species of Rose (q.v.); it is uncertain what species is cultivated in some of the localities most celebrated for it, but *Rosa damascena* is known to be so employed in the north of India, and a kind of otto is sometimes obtained by the makers of rose-water from *Rosa centifolia* in Europe. Ghazipur, near Benares, is celebrated for its rose-gardens, which surround the town, and are in reality fields occupied by rows of low rose-bushes, extending over 160 acres. Cashmere is noted for its extensive manufacture of otto, as are also the neighbourhoods of Shiraz and Damascus. Kezanlik is the centre of the rose-growing district in the Balkans, which is 40 miles long; *Rosa moschata* affords the chief supply. The gathering is commenced on the third year, and is carried on chiefly in May and June. About 7200 lb. of petals are required to produce 2½ lb. of otto, or about the gathering of 2½ acres. The pure essence fetches from £16 to £18 the pound, and the annual product in Roumelia may be £80,000 in good seasons. The French perfumers buy the first quality, Austria and America the second. In the south of France about 30 million pounds of roses are gathered annually for

oil distillation at about 2s. 3d. per lb. According to some calculations, 250 to 300 lb. of rose-petals are required there to produce an ounce of otto by ordinary distillation. To procure the otto, the rose-petals are usually distilled with about twice their weight of water, and the produce exposed to the cool night-air in open vessels, from which the thin film of otto is skimmed with a feather in the morning. Otto is said to have been first procured by what may be called an accidental distillation of rose-petals exposed with water to the heat of the sun, and to have been found floating on the surface of the water; it is still sometimes obtained in India by such a process. It is said to be also obtained by dry distillation of rose-petals at a low temperature. During the distillation of rose-petals a small quantity of a solid volatile oil comes over, which crystallises and floats on the water in the receiver; this is sometimes called *English Oil of Roses*. Otto of roses is not unfrequently adulterated with geranium-oil, sandalwood-oil, oil of rhodium, &c. It is much used for making hair-oil, a drop of it being enough to impart a pleasant odour to a considerable quantity; olive-oil scented by a few drops of otto is often sold under the name of otto of roses. It is also used in making lavender-water and other perfumes. The odour of otto itself is too powerful to be altogether pleasant, and frequently gives headache. Another method of obtaining the scent of roses is described in the article PERFUMERY. Otto of roses is a mixture of two volatile or essential oils; the one solid at ordinary temperatures, and the other liquid. The solid oil of roses (rose camphor, stéaroptène of oil of roses) possesses of itself very little odour. The liquid oil of roses (éléoptène of oil of roses) is a very fragrant liquid. The otto of roses may be regarded as a solution of one part of the solid oil in two parts of the liquid. Medicines are occasionally perfumed by otto of roses, and it is sometimes added to unguents and spirit-washes.

Ottoman Empire. See TURKEY.

Ottrelite, a silicate of alumina with protoxides of iron and manganese and water. It occurs in the form of thin hexagonal plates or tables in certain more or less metamorphosed slates, which are hence termed *Ottrelite-slate*.

Ottum'wa, capital of Wapello county, Iowa, on both sides of the Des Moines River, 75 miles by rail W. by N. of Burlington, in the heart of the state's bituminous coalfields. The residence portion extends along the high bluffs. A number of railways meet here; the general passenger depôt cost \$125,000. Extensive dams concentrate the river's water-power; and the numerous industrial works include planing, flour, starch, and linseed-oil mills, foundries, plough, cutlery, and screen factories, bridge-works, cooperages, manufactories of furniture, boilers, &c., and a large pork-packing establishment. There is a normal school here. Pop. (1885) 10,506; (1890) 14,001.

Otway, THOMAS, one of the greatest masters of English tragedy, of whose life, says Dr Johnson, 'little is known, nor is there any part of that little which his biographer can take pleasure in relating.' He was born at Trotton in Sussex, March 3, 1651, son of the rector of Woolbeding in that county, and entered Christ Church, Oxford, as a gentleman-commoner in 1669. He was a brilliant and impulsive youth—'charming his face was, charming was his verse,' says Dryden, but his life throughout was darkened by the shadow of misfortune. He made a wretched failure as an actor in Aphra Behn's *Forc'd Marriage* in 1671, declined the church, and left the university without a degree in 1674, and next year obtained a cornetcy in a troop of horse. A year later he was settled in London, and

had a tame and conventional tragedy, *Alcibiades*, accepted at the Duke's Theatre, which was managed first by Davenant, then by Betterton. In it the beautiful Mrs Barry made her first appearance, and with her the hapless poet quickly fell in love. In 1676 Betterton accepted *Don Carlos*, a good tragedy in rhyme, nervous and full of pathos, dedicated to the Duke of York. Its plot, like that of his greatest play, he owed to the Abbé St-Réal. The year after Otway translated Racine's *Titus and Berenice*, as well as Molière's *Cheats of Scapin*. The intrigue between Rochester and Mrs Barry now became more than he could bear, and through the influence of the Earl of Plymouth, a college friend, and one of the king's bastards, he received a cornet's commission again, and went a-soldiering to Flanders. It proved a complete fiasco, and he soon came back to his infatuation, miserable and unpaid, a butt for Rochester in his poor and spiteful *Session of the Poets*. In 1678 he had produced a poor comedy, *Friendship in Fashion*; in 1679 another, *The Soldier's Fortune*, full of touches of autobiographic detail. He was ever improvident and dissipated, and his affairs by this time had become desperate, but the death of his rival in 1680 seems to have nerved him to make a brave effort to shake off his burden of debt. That year yielded two tragedies, and his one important poem, *The Poet's Complaint of his Muse*, a rough, but firmly drawn satirical portrait of himself and his principal enemies, Rochester, Shadwell, and Settle. Of the plays, the first was *The Orphan*, a tragedy in blank verse, marred by many faults in plot besides its radical indelicacy, but stamped throughout with power and sovereign pathos, over whose central figure, Monimia, says Mr Gosse, perhaps more tears have been shed than over any other stage-heroine. The other was *The History and Fall of Caius Marius*, confessedly a kind of cento from Shakespeare's *Romeo and Juliet*, with touches from *Julius Caesar*. The year 1682 saw his greatest work, *Venice Preserved*, or a *Plot Discovered*, a noble masterpiece of tragic passion, admirably constructed, its heroine Belvidera a delightful creation of almost the highest order of dramatic genius. The only blot upon its perfection is the comic passages, which M. Taine alone among critics finds Shakespearian. Otway's mistress was now at the height of her fame, and in the parts of Monimia and Belvidera had taken the town by storm. Six letters of his to her are extant, written apparently about 1682, which tell us the touching story of his faith and of her cruelty, how she played with his passion for seven years, and at last broke his heart. From this time he sinks out of sight, drowned in dissipation, debt, and misery. He reappears again in 1684 with *The Atheist*, a feeble comedy, and, on the death of Charles II. in February 1685, with *Windsor Castle*, a poem addressed to the new king. But his claims were neglected, and he wore out the ruins of his wasted life in abject misery in a sponging-house or tavern on Tower Hill. Here he died, April 14, 1685, choked, it is said, after a long fast, with a piece of bread, which he had rushed in the eagerness of hunger to buy with a guinea given him by a passing stranger from whom he had begged a shilling.

In 1719 a badly edited tragedy, *Heroick Friendship*, was published as his, and Mr Gosse thinks that, imperfect as the execution is, the plot and ideas are characteristic of Otway. The best edition of his works is still that by Thornton (3 vols. 1813). Otway owed much to Corneille, and was long popular in France, despite the severe and unjust judgment of Voltaire. His life recalls the tragic history of Marlowe, just as his greatest play reminds a reader of *Othello*. Strong without bombast, its exquisite love-scenes between Jaffier and

Belvidera tender without weakness, 'it is simply,' says Mr Gosse, 'the greatest tragic drama between Shakespeare and Shelley. Out of the dead waste of the Restoration, with all its bustling talent and vain show, this one solitary work of supreme genius arose unexpected and unlimited.'

See Johnson's *Lives*, Ward's *History of English Dramatic Literature* (vol. ii. 1875), Edmund Gosse's excellent essay in *Seventeenth Century Studies* (1883), and the Hon. Roden Noel's edition in 'Mermaid' series (1888).

Ouabain is a crystalline glucoside separated from the wood and roots of *Carissa shimpertii*, a plant growing on the east coast of Africa. It is intensely poisonous, a twelfth of a grain being sufficient to kill a rabbit. It acts upon the heart in the same way that digitalis does, and has been employed in medicine as a substitute for digitalis, and also to lessen the violence of the paroxysms in hooping-cough. The Somalis make an extract of the wood and roots for an arrow-poison.

Oubliette (Fr., 'place of forgetfulness'), a dungeon in which persons condemned to perpetual imprisonment were confined—especially a perfectly dark underground dungeon—into which the prisoners were let down from above by ropes.

Oudenarde (*Audenarde*), a town of Belgium, on the Scheldt, 37 miles W. of Brussels. It has a fine flamboyant Gothic town-hall (1535) and two interesting churches. Margaret of Parma was born here. Pop. 5864. In 1706 Oudenarde was taken by Marlborough; and an attempt made by the French to retake it brought on the famous battle of Oudenarde, the third of Marlborough's four great victories, which was gained, on the 11th July 1708, with the aid of Prince Eugene, over a French army under the Duke of Burgundy and Marshal Villars.

Oudh, or AWADH, a province of British India, separated on the north from Nepal by the lower ranges of the Himalaya, whence it gradually slopes, a great plain watered by the Gumti, Gogra, and Rapti rivers, to the Ganges. Area, 24,246 sq. m. Formerly an independent chief-commissionership, it is now administered by the lieutenant-governor of the North-west Provinces (q.v.). Pop. (1869) 11,220,232; (1881) 11,387,741 (476 to the sq. m.). The bulk of the inhabitants are Hindus, though the dominant native race for centuries has been Mohammedan. The Brahmans are the most numerous class, about one-eighth of the whole population. The principal towns are Lucknow (the capital), Faizabad, Bahraich, Shahabad, Rai Bareilly, Ajudhya. Oudh is believed to have been one of the oldest seats of Aryan civilisation in India. After being the centre of a long native Hindu dynasty it was subjugated by the ruler of Kanauj, and in 1194 was made subject to the Mussulman empire of Delhi. In 1732-43 it became virtually an independent state, and the dynasty of the Nawabs lasted until the annexation of the province by the British in 1856. During the mutiny of 1857 Oudh was one of the centres of rebellion and the scene of highly dramatic events.—The city of Oudh or AJODHYA has been treated of under the second title.

Oudinot, CHARLES NICOLAS, Duke of Reggio and Marshal of France, was born at Bar-le-Duc, Meuse, 25th April 1767. At the age of seventeen he entered the army, and in the revolutionary wars distinguished himself in various actions with the Prussians and Austrians. In 1805 he obtained the Grand Cross of the Legion of Honour, and about the same time received the command of ten battalions of the reserve, afterwards famous as the 'grenadiers Oudinot.' At the head of this corps he did good service in the Austrian campaign. He was present at Austerlitz and Jena, gained the

battle of Ostrolenka (16th February 1807), and greatly contributed to the success of the French at Friedland. He sustained his now brilliant reputation in the second Austrian campaign of 1809, and was created Marshal of France and Duke of Reggio. In 1810 he was charged with the occupation of Holland, was engaged in the disastrous Russian campaign, and subsequently took part in the various battles of 1813 between the French and the Russians and Austrians. He was one of the last to abandon Napoleon, but he did so for ever, and spent the period known as the 'Hundred Days' on his own estates. At the second restoration he became a minister of state, commander-in-chief of the royal guard and of the national guard, and was created a peer of France, Grand Cross of St Louis, &c. In 1823 he commanded the first division of the army of Spain, and was for some time governor of Madrid. After the revolution of July 1830 Oudinot retired to his estates; but Louis-Philippe in 1842 appointed him governor of the Invalides. He died at Paris, 13th September 1847. See his *Life* by Nollet (Paris, 1850).—His son, CHARLES NICOLAS-VICTOR OUDINOT, Duke of Reggio (1791–1863), was a general in the French army. He first distinguished himself in Algeria, and was general of the French expedition against Rome in 1849.

Ouida, the pseudonym of the novelist LOUISE DE LA RAMÉ, who was born about 1840, and who spent part of her girlhood with her mother at Bury St Edmunds. About 1874 she was living in London at the Langham, and since then Florence has been her chief abode. She was writing for *Colburn's New Monthly* and *Bentley's Magazine* as early as 1861; and among more than a score of novels by her may be mentioned *Strathmore* (1865), *Idalia* (1867), *Under Two Flags* (the best, 1868), *Puck* (1869), *Folle Farine* (1871), *Pascarel* (1873), *Ariadne* (1877), *Moths* (1880), *Princess Napraxine* (1884), and *Guilderoy* (1889). Muscular heathenry, nature-worship, and an encyclopædic ignorance are the prevailing notes of these books, which remind one of scene-painting, very clever, but wholly unreal. There is a dash and go about them, a 'glamour' and glitter, and withal a singular sameness. One wearies of their brown harlots and blasé aristocrats; one ceases even to be amused with their classical and cosmopolitan malapropisms.

Oulistiti. See MARMOSET.

Oulachan. See CANDLE-FISH.

Oulless, WALTER WILLIAM, portrait-painter, was born 21st September 1848, at St Helier's, Jersey, and educated at Victoria College, Jersey. He began to study art in London in 1864; four years later first exhibited at the Academy; and became an A.R.A. 1877, an R.A. in 1881. Of his portraits perhaps that of Darwin is most generally known on account of the very fine etching from it by Rajon. Mr Oulless never paints a commonplace portrait, his work is sober and manly, and he is too great a student of character to make his art the medium of flattery. His portraits of Justice Manisty and Cardinal Newman are fine examples of his different methods.

Ounce (Lat. *uncia*), the twelfth part of the *as* or *libra* (pound), or indeed the twelfth part of any magnitude, whether of length, surface, or capacity. Hence *inch*, the twelfth part of a foot. In Troy weight the ounce is divided into 480 grains, and 12 ounces make a pound; the ounce in Avoirdupois weight contains 437½ grains Troy, and 16 of them go to the pound.

Ounce (*Felis uncia*), a feline carnivore like the leopard, but with lighter, longer fur, and with

a skull unusually broad for one of the *Felidae*. It frequents the mountains of central Asia. It may also be noted that a somewhat similar title, *Felis onca*, belongs to the jaguar.

Oundle, a small but ancient and pleasant town of Northamptonshire, 13 miles SW. of Peterborough by rail, has an old church, partly Early English and partly Decorated style, restored in 1864. Here St Wilfrid died. Laxton's Grammar-school dates from 1550. Lace is made here. Pop. 2890.

Ourari. See CURARI.

Ouro Preto ('Black Gold'), capital of the province of Minas Geraes, Brazil, stands among barren mountains, 3780 feet above sea-level, and 200 miles N. by W. of Rio Janeiro. It contains several handsome official buildings, but otherwise consists mainly of narrow and irregular streets. The gold-mining is now reduced to comparatively unprofitable washings. Pop. (1890) 22,000.

Ouse, a river of Yorkshire, formed by the union of the Swale and the Ure in the immediate vicinity of the village of Boroughbridge, and flowing south-eastward past York, Selby, and Goole. About 8 miles below the last town it joins the Trent, and forms the estuary of the Humber (q.v.). The length of its course from Boroughbridge is 60 miles, for the last 45 of which (from York) it is navigable for large vessels. Its principal affluents are the Wharfe and the Aire from the west, and the Derwent from the north-east. The basin of the Ouse, or the Vale of York, commences about the northern boundary of the county near the river Tees, from whose basin it is separated by a low ridge of hills, and extends southward, including almost the whole of Yorkshire (q.v.).—The GREAT OUSE, rising close to Brackley, in the south of Northamptonshire, flows north-eastward through the counties of Buckingham, Bedford, Huntingdon, Cambridge, and Norfolk, till it falls into the Wash, 2½ miles below Lynn. It is 160 miles in 'entire length, and is navigable for about 50 miles. It receives the Ivel, Cam, Lark, and Little Ouse.

Ouseley, SIR FREDERICK ARTHUR GORE, musician, was born on 12th August 1825, and at nineteen succeeded his father, Sir Gore Ouseley (1770–1844), the celebrated Orientalist and first baronet. He graduated at Christ Church, Oxford, and took orders, his first curacy being at St Paul's, Knightsbridge. In 1855 he followed Henry Bishop as professor of Music at Oxford, and in 1856 became vicar of St Michael's, Tenbury. He had an immense knowledge of music, extending from St Ambrose to Wagner. His mastery of the literature of music is seen in his edition of Neumann's *History of Music*, and his treatises on harmony published in the 'Clarendon Press' series have taken their place as standard works. He was an accomplished linguist, and collected a magnificent library. His oratorios *St Polycarp* and *Hagar* are too solid and severe to be popular, but will always command respect. Haver-gal's *Memorials of F. A. G. Ouseley*, published after his death in 1889, is a collection of contemporary opinions pronouncing him a perfect gentleman, a skilled musician, and a churchman who devoted the whole of his fortune to building and endowing St Michael's College, Tenbury, for the training and education of choristers.

Outcrop, in Geology, the name given to the edges of strata as they appear or crop out at the surface. The same term is applied to the line along which a mineral vein or lode comes to the surface—although other terms, such as 'outgoing,' 'back,' are also employed by miners.

Outlawry, in English law, means putting one out of the protection of the law, for contempt

in wilfully avoiding execution of legal process. Formerly, in the common law courts, if the defender would not enter an appearance certain proceedings were taken to outlaw him, so as to allow the action to go on without his appearance. These proceedings, however, were abolished in 1879, and, in the majority of cases, it is immaterial as regards the action whether the defendant appear or not, provided he was properly served with the original writ of summons. After judgment a defendant against whom a *capias* was granted might be outlawed if the sheriff failed to find him. These forms of process are now obsolete. In criminal proceedings it is still possible to outlaw a person who cannot be found and arrested. But a criminal who flies the country may now, as a general rule, be made amenable to justice by applying to a foreign government for his Extradition (q.v.). Outlawry therefore is practically obsolete. See Stephen's *Criminal Procedure*. The effect of outlawry was that a man forfeited his rights, and was precluded from suing or defending in any English court; but the outlawry might be reversed by means of a plea or of proceedings in Error (q.v.).

Outram, SIR JAMES, the 'Bayard of India,' was born 29th January 1803, at Butterley Hall, Derbyshire, the residence of his father, Benjamin Outram (1764-1805), a well-known engineer. His mother in 1810 removed with her five children to Aberdeen, where and at Udney James was educated. After one session at Marischal College, in 1819 he received an Indian cadetship, and became lieutenant and adjutant in the Bombay native infantry. Between 1825 and 1835 (in which latter year he married his cousin, Margaret Anderson) he successfully organised a corps of the wild Bhils; from 1835 to 1838 he was political agent to the Mahi Kantha district in Gujrat. In 1839 he attended Sir John Keane as aide-de-camp into Afghanistan (q.v.); and his eight days' ride of 355 miles, disguised as an Afghan merchant, from Kelat, through the perilous Bolan Pass, to the sea, will long be famous in eastern annals. Appointed in 1840 political agent in Sind, he distinguished himself by his heroic defence of the British Residency at Hyderabad against 8000 Beluchis (15th February 1843), as also by his manly opposition to what he deemed Sir Charles Napier's aggressive policy towards the Ameer. He was afterwards resident at Satara and Baroda, and in 1854, on the eve of the annexation of Oudh, was selected by Lord Dalhousie for the highest political office in India—the Residency of Lucknow. In 1857, after a third brief furlough to Europe, he commanded the Persian expedition—a short, brilliant campaign, whose objects triumphantly attained, he returned to India a G.C.B. (he had been knighted sixteen months before). When he landed in July the Mutiny was raging; and Lord Canning tendered him the command of the forces advancing to the relief of Lucknow. He chivalrously waived that glory in favour of his old lieutenant, Havelock (q.v.), who already had fought eight victorious battles with the rebels; and accompanied him only as chief-commissioner of Oudh, whilst tendering his military services as a volunteer. Lucknow (q.v.) was relieved, and Outram took the command, but only to be in turn himself besieged. He held the Alum-bagh against almost overwhelming odds, until Sir Colin Campbell advanced to his relief. He then made a skilful movement up the left bank of the Gumti, which led to a final and complete victory. For his services he was in 1858 promoted to the rank of lieutenant-general, thanked by parliament, and created a baronet. He took his seat as a member of the Supreme Council at Calcutta, but in 1860 had to return to England, already stricken by the hand of death. He spent the winter of 1861-62 in Egypt, and, after a short

stay in the south of France, expired at Paris, 11th March 1863. He was buried in Westminster Abbey; and statues of him have been reared in London and Calcutta. See his *Life* by Major-general Sir F. J. Goldsmid (2 vols. 1880).

Outrigger. See **BOAT**.

Ouvirandra. See **LATTICE LEAF, AQUATIC PLANTS**.

Ouzel, or **OUSEL** (Old Fr. *oisel*, 'bird'), an old name of the blackbird (as in *Midsummer Night's Dream*). But it is also applied to other birds. Thus, one British thrush (*Turdus torquatus*) is called the Ring Ouzel, and the Dipper (q.v.) is very generally known as the Water Ouzel.

Ovampos, or **OVAMBO**, also called Otjiherero, an industrious and peaceable Bantu people of the west coast of Africa, inhabiting the country south of the Cunene. Ovampoland is accordingly in the German protectorate, and extends from Damara-land northward to the Portuguese frontier. Some 50 miles from the coast the country rises into a lofty tableland, which is moderately fertile, and then declines to the south and east into the deserts of the Kalihari and the region of Lake Ngami. Many strong indications of copper ore are found in various places. Ivory is still traded in.

Ovariectomy, in Surgery, the excision of the ovaries. The ovaries in the female are analogous to the testes in the male, and are two oblong flattened bodies (about an inch and a half in length, three-quarters of an inch in width, and nearly half an inch thick in the human subject), situated on either side of the uterus, to which they are connected by ligaments and by the Fallopian tube. The ovary is composed of two well-defined portions, a superficial or 'cortical' portion, and a deep or 'medullary' portion. The whole is enclosed in a tough fibrous coating, which is, however, closely blended with the cortical portion, and cannot be stripped off. It is termed the *tunica albuginea*. The medullary portion is highly vascular, and of a reddish colour. The cortical portion in the adult ovary contains an enormous number of vesicles, varying greatly in size. These are the *Graafian follicles*, and contain the ova or germs—the female element of reproduction. Their number is estimated at 30,000. From ten to twenty large and more or less mature vesicles are found near the surface, to which they gradually approach as they become developed. The structure of these ovisacs and their contained ova is somewhat complex, and cannot be described here. More or less coincident with menstruation is the process of *ovulation*, by which is meant the rupture of the wall of Graafian follicle, and the escape of the contained ovum. On its escape from the ovary the ovum enters the end of the Fallopian tube, by which it is conveyed into the uterus.

The ovary is the subject of several diseased conditions. (1) It is the seat of acute and chronic inflammation. This may arise from injuries during labour, operations in the pelvis, but very frequently is the result of gonorrhœal infection, spreading from the vagina. Such inflammations cause great organic changes in the structure, often leading to sterility, and they are usually associated with severe pain, frequently so intense as to unfit the subject for all active duty. (2) The ovary is the seat of new growths, which may be of several varieties. Some represent enlargements of one or more Graafian follicles, and attain an enormous size, sometimes weighing 100 lb. or more. They contain fluid which is usually of a viscid, ropy nature, and brownish colour, but sometimes presents other characters. These are known as *ovarian cysts*. Other tumours are of a more or less solid nature, and contain portions of hair, teeth, bone, &c., and

are known as *dermoid tumours*. Moreover, the ovaries may become the seat of cancerous disease with or without the occurrence of such tumours.

The treatment of ovarian disease by the removal of the offending organ is one of the triumphs of modern surgery. Formerly relief in cystomata was only obtained temporarily by tapping—i.e. withdrawing some of the fluid by means of a trocar and canula. But the tumour almost always filled again, and, though tapping might be repeated time after time, the patient ultimately succumbed. Now the abdominal wall is laid open, the tumour emptied as much as possible of its contents, the collapsed sac drawn through the incision, its neck secured by ligature or otherwise, the mass cut away, the stump returned to the abdomen, and the wound carefully closed by stitches.

Towards the middle of the 19th century the operation was performed by a few surgeons, under the protest of the great majority of the medical profession; now it takes its place as a routine operation, demanded in any suitable case, and performed with results as regards the saving of life and restoration to health, together with an immunity from risk, which can be claimed by no other major operation. The operation for extirpation of ovarian cystoma was first performed by Ephraim M'Dowell of Kentucky in 1809, but was established in England as a regular operation by Charles Clay of Manchester, who operated on his first case in 1842. Clay operated on nearly 400 cases with 69 per cent. of recoveries. Since then the operation has been performed many thousands of times, and the mortality has been reduced to a figure which renders the operation, while always one of the gravest, yet, in competent hands, one of the safest in surgery. To this result the labours in Britain of Spencer Wells, Thomas Keith, and Lawson Tait have mainly contributed. With the best operators the mortality at this moment is probably less than 5 per cent., and some have had series of over 100 cases without a death. This result has been ascribed to various causes, such as the mode of treating the pedicle, or stump, the use of antiseptics, &c., but is probably most due to the experience acquired in dealing with the various complications and difficulties arising in the operation.

Within the last few years the removal of the ovaries and Fallopian tubes for other than cystic disease has come to be recognised as a regular operation, and is now frequently performed. The conditions which are considered as demanding this are: (1) Chronic inflammation in the ovaries or tubes, resulting in the formation of pus, &c. in the latter, or giving rise to intolerable pain and discomfort, and rendering life utterly miserable; (2) cases of fibroid tumour of the uterus, in which life is threatened by the great loss of blood which these tumours often cause. Removal of the ovaries in these cases when possible is usually followed by cessation of growth and shrinking of the tumour, and entire stoppage of serious hemorrhage.

Consult *Diagnosis and Treatment of Abdominal Tumours*, by Sir Spencer Wells (1885), and *Diseases of Women*, by Lawson Tait (1885).

Ovary, in Botany, the part of the Pistil (q.v.) containing the Ovule (q.v.). See FLOWER, FRUIT, SEED.

Ovation. See TRIUMPH.

Oven. The old type of baker's oven, still very largely used, is a low arched chamber either of brick with a tile or stone sole, or built entirely of stone. A common size of sole is 11 feet 6 inches by 9 feet 6 inches (some are smaller), with sides 18 inches high, from which the crown or arch springs. The door is in front, and the dough is put in with a long wooden spade called a 'peel.' In one class of these ovens the fireplace or furnace is placed in the front corner, with an opening admitting the products of combustion directly into the oven, while there is an exit flue on the other side. This furnace is fired from the bakehouse; coke or coal is used for fuel, and any smoke is mostly cleared away during the heating up of the oven. Sometimes the plan of having a fixed fire within the oven itself is adopted, and another way is to have a movable iron furnace, called a chaffer, which can be shifted from place to place, so as to evenly heat the oven. For this inside firing wood is the best fuel. In Scotland a peculiar sort of stone is used for the construction of oven soles. It is a kind of serpentine, is of a refractory nature, and is called 'lakestone' or 'leckstone.' This rock, termed by geologists *picrite*, is quarried at Blackburn, near Bathgate, and two or three other places in Scot-

Bailey-Baker Oven—Longitudinal Section: A, furnace bars; B, main flue; C, air chamber; D, door of oven; E, E, doors of furnace.

land. It makes a better and more durable sole than tiles or bricks.

Many new forms of ovens have been introduced of late years. Among others the Bailey-Baker oven is being extensively adopted. It is shown in longitudinal section in the annexed figure. It can be used either as an externally or as an internally heated oven. The furnace is placed below the oven sole, and the heated gases which are generated pass, by means of flues, entirely round the oven without actually entering it, if it is to be worked solely by external heat. But by means of openings, regulated by valves or dampers, the gases from the furnace can be led into the oven, and so heat it internally. The construction of the oven is such that, even when worked in the latter way, fragments of fuel rarely get inside, so that comparatively little cleaning is necessary, and baking can go on continuously with the exception of the time required to fill and discharge the oven.

Some ovens are now heated with hermetically-sealed iron pipes containing water, which is converted by heat into superheated steam (see STEAM). The pipes are placed inside the oven, but a portion, or portions of them, project through its back wall into a furnace. Perkins was the originator of

this method of heating. A recent form is known as the Weighorst steam-heated oven. It has a draw-plate, or movable sole, fixed on wheels, so that it can be drawn out in front of the oven and loaded or unloaded very quickly. With this oven there is little time required for raising the heat between the batches. Another way of heating ovens is by gas-burners. Ovens for army use in barracks or the field are generally arranged so as to be serviceable for cooking meat, roasting potatoes, coffee, &c., as well as baking bread. In those for the field portability is a main essential. For biscuit ovens, see BISCUITS. Coke-ovens are described under COKE.

Oven-bird, a genus (*Furnarius*) and subfamily (Furnariinae) of Passerine birds, family Dendrocolaptidae. The name is given because some of the species build nests resembling an oven or beehive. The genus, which consists of nine species, is exclusively South American, ranging from Guiana and Ecuador to La Plata. The habits of these birds have been described chiefly by Mr Edward Bartlett, and by Darwin in his *Voyage of the Beagle*. The name oven-bird is also applied, for a similar reason, to the willow-wren (*Phylloscopus trochilus*).

Overbeck, JOHANN FRIEDRICH, painter, was born at Lübeck, 4th July 1789, and commenced his art studies at Vienna in 1806 as a pupil of the pseudo-classical school of David; but, having adopted notions on art essentially different from those inculcated in the academy, he was expelled along with some like-minded friends, and in 1809 set out for Rome. His principle was to abjure the classical Renaissance and its sensuousness, and to 'abide by the Bible.' In Rome he was joined by Cornelius, Schadow, Schnorr, and Veit; and these five laid the foundation of a school that influenced the taste for art in Europe, though they were scoffed at as 'Pre-Raphaelites,' 'Nazaries,' 'Church-Romantic painters,' and had long to struggle with poverty. A picture of the Madonna, which Overbeck painted in 1811, brought him into marked notice. He was next employed by the Prussian consul, Bartholdy, to execute for his house at Rome frescoes illustrating the history of Joseph, the 'Selling of Joseph' and the 'Seven Lean Years' being the subjects assigned to Overbeck. After completing these he painted in fresco, in the villa of the Marchese Massimo, five large compositions from Tasso's *Jerusalem Delivered*. In 1813 he abjured Lutheranism, and embraced the Roman Catholic religion. Overbeck's chief work is a fresco at Assisi, 'The Vision of St Francis.' His oil-pictures are inferior to his frescoes, being dry and weak in colour. Among his famous pictures are 'Christ's Entry into Jerusalem,' at Lübeck; 'Christ's Agony in the Garden,' at Hamburg; 'Lo Sposalizio,' at Berlin; 'The Triumph of Religion in the Arts,' at Frankfort; the 'Incredulity of St Thomas,' in London. He executed a great many drawings and cartoons remarkable for devotional feeling, most of which, like his frescoes and paintings, have been engraved. One of his last undertakings was a series of designs from the Evangelists, delicately engraved in the line manner. Amongst the characteristics of the school are devout feeling, hardness of outline, scholastic composition, and the avoidance of merely sensuous beauty both in colour and form. Overbeck died at Rome on 12th November 1869. See *Life* by J. B. Atkinson (1882), in 'Great Artists' series.

Overbury, SIR THOMAS, was born in 1581 at Compton-Scorpion, in Ilmington parish, Warwickshire, his father being squire of Bourton-on-the-Hill in Gloucestershire. After three years at

Queen's College, Oxford (1595-98), he studied awhile at the Middle Temple, and travelled then on the Continent, returning an accomplished gentleman. In 1601 at Edinburgh he met Robert Carr, then page to the Earl of Dunbar, and the minion afterwards of James I., who knighted him in 1607, and in 1611 made him Viscount Rochester. The two became inseparable friends, and Overbury himself was, through Carr's influence, knighted in 1608, the year before his second visit to France and the Netherlands. Meanwhile, in 1606, the lovely but profligate Frances Howard (1592-1632) had married the third Earl of Essex (q.v.), and during his two years' absence had intrigued with more than one lover—Carr the most favoured. Overbury had played pander to their guilty intercourse; but Carr now telling him that he purposed to get Lady Essex divorced from her husband, and then to marry her, he strongly deprecated the idea, declaring she might do for a mistress but not for a wife. Carr informed Lady Essex what Overbury had said of her; she became furious for revenge, and offered Sir David Wood (between whom and Sir Thomas there was a standing feud) £1000 to assassinate him—an offer prudently declined, except under royal assurance of pardon. So on 21st April 1613 Overbury, on a most trivial and illegal pretext—his contemptuous refusal to go on an embassy—was thrown into the Tower, where on 15th September he was poisoned. Three months later Carr (just created Earl of Somerset) and his paramour were married with great pomp, and the whole affair was soon to appearance forgotten. But in the autumn of 1615, after Villiers had largely supplanted Somerset, an enquiry was instituted, and four of the humbler instruments were promptly hanged—among these Mistress Anne Turner in her starched yellow ruff. In May 1616 the countess pleaded guilty, and the earl was found guilty; but by an amazing stretch of the royal prerogative they were pardoned. In 1622 they were even released from the Tower; and Somerset survived till 1645.

Overbury's works, all published posthumously, include *The Wife* (1614), a didactic poem; *Characters* (1614), whose conceits are not lacking in epigrammatic point; and *Crumbs fall'n from King James's Table* (1715). They were collected in 1866 by E. F. Rimbault, with a Life prefixed. See also Andrew Amos, *The Great Oyer of Poisoning* (1846); Gardiner's *History of England*; Spedding's *Studies in English History* (1886); and other works cited at JAMES I., BACON, and COKE.

Over Darwin. See DARWIN.

Overland Route to India, Australia, and the East is now understood to be that from England across France, through Mont Cenis by tunnel, to Brindisi in Italy, thence through the Levant, the Suez Canal, Red Sea, and Indian Ocean. This makes the journey only about half as long as the voyage round by the Cape of Good Hope, a little over 6000 miles instead of more than 12,000. The saving in time is even more considerable. The time from London to Bombay is about four weeks, instead of three months by the Cape. In 1838 a monthly service was started to carry the mails across Egypt; but to Lieutenant Waghorn (1800-50) belongs the credit of first showing how the voyage from India could be still further shortened. On 31st October 1845 he arrived in London with the Bombay mail of the 1st October (*via* Austria, Bavaria, Prussia, and Belgium). The railway from Suez to Alexandria by Cairo was opened in 1858; but the great event that rendered the Overland Route available for passengers generally was the opening of the Suez Canal in 1869. See also EUPHRATES.

Overlap, in Geology. When the upper beds of a conformable series of strata extend beyond the

bottom-beds of the same series, the former are said to overlap the latter. Hence strata showing this structure constitute an *overlap*.

Overstone, SAMUEL JONES LOYD, BARON, an economist and financier, was born in London, 25th September 1796, being the only son of Mr Lewis Loyd, descended from a respectable Welsh family, and a leading partner in an eminent banking-house. From Eton he passed to Trinity College, Cambridge. On leaving Cambridge Loyd entered his father's banking-house, afterwards merged in the London and Westminster Bank. He entered parliament in 1819 as Whig member for Hythe, which he continued to represent till 1826, and in 1850 was raised to the peerage by the title of Baron Overstone and Fotheringhay. The first of Lord Overstone's famous tracts on the management of the Bank of England and the state of the currency was published in 1837, and was followed by others between that period and 1857. The proposal for making a complete separation between the banking and issue departments of the Bank of England, introduced by Peel into the Act of 1844, was first brought forward in these tracts. Lord Overstone was currently believed to have been worth £6,000,000 or £8,000,000, but after his death, without male issue living, on 17th November 1883, his personal estate was sworn under £2,118,803. He zealously opposed the principle of limited liability, and the introduction of the decimal system.

Overseers. See PARISH, POOR-LAWS.

Overton, a parliamentary borough of Flintshire (detached), near the Dee, 23 miles NNW. of Shrewsbury. With Flint, &c., it returns one member. Pop. 1131.

Overture (Fr. *ouverture*) was originally an instrumental prelude to an opera, oratorio, &c. It first received definite form from the composer Lully (q.v.), whose pattern was followed by most succeeding writers, including Handel, up to the time of Gluck and Mozart. The somewhat different Italian form, styled *Sinfonia*, was developed by Scarlatti. Modern overtures almost defy classification. Two leading styles may be indicated—the *medley* form, in which various melodies from the succeeding opera are interwoven, and the finest examples of which are by Weber and Wagner; and the independent concert overture, usually in the form of a first movement of a sonata, without repeat, of which Mendelssohn's are the type. Mozart's *Magic Flute* overture is a triumph of constructive skill, combining the forms of sonata and fugue. Beethoven's *Leonora No. 3* is considered the greatest of all; while foreshadowing the events and music of the opera, it has an individual form of its own, as has also his *Egmont* overture. Operas—e.g. Wagner's—now usually commence with a short *Introduction* or *Prelude*, leading without break into the first scene.

Overyssel, a province of the Netherlands, lying on the east side of the Zuider Zee, and separated from Guelderland on the south by the river Yssel. Area, 1291 sq. m.; pop. (1887) 291,462. Rich meadows cover almost one-third; moors are extensive; the province is well intersected by canals. The chief cities are Zwolle, Deventer, and Kampen.

Ovid (PUBLIUS OVIDIUS NASO), born March 20, 43 B.C., at Sulmo, the present Solmona, in the Abruzzi, was the younger of two sons, both of whom were brought early to Rome by their father, a well-to-do *eques*, who placed them under the most famous rhetoricians of the day, to be trained for the bar. His brother Lucius died in his twentieth year, and Publius, in spite of extraordinary forensic aptitude, gave up his whole time and energies to poetry. He filled, indeed, a few

legal posts, but soon abandoned them, and, like other young Romans of his class, repaired to Athens, whence he crossed to Asia Minor, and on the return journey lingered a while in Sicily. While still a youth he married, but almost immediately separated from his wife, only to take another, with whom he lived scarcely more happily. By her he had a daughter, Perilla, herself a poetess. He married yet again, and this, his third wife, Fabia, gained and returned his best affections, and, unlike her two predecessors, survived him. His life at his country-seat, among congenial friends and in correspondence with the most distinguished of his contemporaries, was an enviable one. Messala Corvinus, a highly cultured poet, exercised on his rapidly developing powers a salutary influence, reinforced by that of the younger Macer, author of the *Ante-Homerica* and *Post-Homerica*, of Propertius, the epic poet Ponticus, and others. He had no acquaintance personally with Tibullus or Virgil, both of whom died 19 B.C.

His first literary success was his tragedy *Medea*, of which Quintilian had a high opinion. Then came his *Epistolæ* or *Heroides*, imaginary love-letters from ladies of the heroic foretime to their lords: but in his next publication he touched the sphere he has made peculiarly his own—his *Amores*, so called from their subject-matter. Here he had Gallus, Tibullus, and Propertius for exemplars, and in wit and wayward fancy, less often in soul and passion, he excelled them all. His *Medicamina Faciei* (a practical poem on artificial aids to personal beauty) seems to have been preliminary to his true master-work, the *Ars Amandi*, or *Ars Amatoria*, in three books, which appeared about 1 B.C., followed by a subsidiary book entitled *Remedia Amoris*—the former teaching how to win and preserve the love of woman, the latter how to relieve the rebuffs and disappointments encountered in the attempt. These publications close the first period of the poet's activity: the second opens with the *Metamorphoses*, in fifteen books, and with the *Fasti*, designed to be in twelve, of which six only were completed. The *Metamorphoses*, according to Bernhardt, surpasses all that antiquity has to show in brilliant and felicitous metrical narration. The *Fasti*, a contemporary work, forms in elegiac distiches a poetic commentary on the calendar, wherein the origin of Roman feast-days, divinities, and religious observances is set forth. Midway in its composition he was banished (8 A.D.); but shortly before he died he worked at a revised version of it in order to dedicate it, thus recast, to Germanicus—the original having been inscribed to Augustus. But he did not carry out this project. As it stands the *Fasti* seeks to ennoble the policy of Augustus, and, by revivifying their forgotten religious ceremonials, to re-awaken in the Roman people the sentiment out of which these ceremonials sprang.

Posterity has failed to fathom the true ground of Ovid's banishment—the poet himself refraining studiously from all but the vaguest allusions to it. He admits that he deserved to be so punished, but he also declares that he was more the witness than the author of the offence. Whether he was concerned in some intrigue of the licentious Julia, or in one of the many scandals connected with Agrippa Postumus, will never be cleared up. Nothing could move Augustus to a reprieve of the sentence; so in the late autumn, 9 A.D., he left Rome, as 'relegatus, non exul,' for Tomi, on the Euxine (close to the present Kustendji). There, at the outskirts of Roman civilisation, severed from wife, daughter, relatives, and friends, with only the nomadic Scythians for neighbours, he languished out the last years of his life. Tiberius remained as deaf to his appeals for mercy as Augustus, and there he died

in 17 A.D. This period constitutes the third of his poetic activity—in which his genius, bereft of its gaiety, responds to his invocation only in the minor notes of melancholy. Already on his last journey from Rome he began the elegies which he published in five books, by name the *Tristia*. Similar in tone and theme are the four books of the *Epistole ex Ponto*, differing only in this from the *Tristia* that they are addressed to a particular friend in Rome—a step he did not venture on in the composition of the latter. His *Ibis*, written in imitation of Callimachus, in which he invokes destruction on an enemy unknown, and his *Hali-eutica*, a poem, extant only in fragments, on the fish of the Euxine, complete the list of his remains.

In mastery of metrical form and in creative fecundity Ovid outsoars all the poets of the Augustan cycle. From his youth up he was so favourably circumstanced that he passed quickly through the successive stages of his development till he reached the highest perfection of which he was capable. The struggle between the new poetry and the old had issued in the subjection of the latter, and he entered immediately on the inheritance prepared for him by others. This he carried to its culmination, in finish as in form. He stands at the limit of the Augustan without by a hair's breadth encroaching on the Silver age. The poetic circle in which he lived, the *beau monde* of Rome in which he moved, the favour of the court in which he basked, all contributed to mould his genius and stamp its products with the hall-mark of 'society.' In that world he has always been a favourite, contriving as he did to combine learning with lightness of touch, force with finish, variety with order. He knew the *vie intime* of the contemporary world, in its real as in its conventional forms, and he could sweep the collective chords of human passion, from love to hate, with the assured boldness of a master. He is the most voluminous of Latin poets, and in this characteristic may be found the cause of his chief defects—his self-repetition, his too frequent echoings of former felicities, the monotony of his cadences, particularly in the elegiac distich. In this metre, where the thought rarely overflows the two-line limit, he has developed a sententiousness in which Quintilian traces his forensic education.

There are old translations of the *Metamorphoses* by Golding (1565), and Garth (q.v.), and others; and an admirable one by King (1871). Complete editions of the text are by Merkel (1853) and Riess (1872-74); of the *Heroides*, by A. Palmer (1874), *Ibis*, by Robinson Ellis (1882), and *Tristia*, by S. G. Owen (1890). See the judgments of Bernhardt, Teuffel, and Ribbeck; also Zingerle's *Ovid und sein Verhältniss zu den Vorgängern* (3 vols. 1869-71), and Rev. A. Church's study in 'Ancient Classics for English Readers' (1876).

Oviedo, the capital of the Spanish province of Asturias (q.v.), 20 miles by rail SSW. of Gijón on the Bay of Biscay and 87 N. by W. of Leon. Standing in a plain between the rivers Nalon and Nora, and sheltered to the north by a hill 470 feet high, it has four main streets, branching off from a central square, and possesses a cathedral, a university (1604), a theatre, a botanic garden, a fine aqueduct, &c. The cruciform cathedral, dating from 781, but mainly rebuilt between 1388 and 1528, is a noble specimen of richly ornamented Gothic, with a tower 284 feet high, the remains of fourteen early kings and queens of Asturias, many much-prized relics, and a fine old library. In or near the city there are several ancient Romanesque churches. Linens, woollens, hats, and firearms are manufactured; whilst in the neighbourhood are many ironworks, and at Prutia (12 miles W.) a great government foundry, producing cannon, rifles, bayonets, &c. Pop. (1887) 42,716. Oviedo, the ancient *Asturum Lucus* or *Ovetum*, was known

during the middle ages as *Civitas Episcoporum*, because many of the Spanish prelates, dispossessed of their sees by the Moors, took refuge here. It was twice plundered by the French of its ecclesiastical and other treasures, in 1809 and 1810.

Oviedo y Valdes, GONZALO FERNANDEZ DE, born at Madrid in 1478, was sent by Ferdinand to St Domingo, in the West Indies, in 1514, as inspector-general of the gold-mines, and subsequently was appointed historiographer of the Indies. After his return to Spain he published a history thereof (1526). Of a second edition (21 vols. 1535) an English translation was made by Eden in 1555; a complete edition of the entire work appeared at Madrid in 4 vols. 1851-55. Oviedo died at Valladolid in 1557. He likewise wrote *Las Quincuagenas*, a valuable gossiping account of the principal personages of Spain in his time.

Oviparous is an objectionable term applied to the great majority of female animals, whose eggs are first laid and then hatched. *Ovoviviparous* is a corresponding term applied to animals in which the eggs are hatched within the body of the mother, and where there is no nutritive connection between parent and offspring. Some reptiles, amphibians, fishes, &c. which do not lay their eggs illustrate this mode of parturition. In regard to the terms oviparous and ovoviviparous it should be noted (1) that all animals are in one sense viviparous, for whatever is born is normally alive; (2) that 'viviparous' animals *par excellence*—viz. the placental mammals—differ from 'ovoviviparous' animals, such as the brown lizard (*Zootoca vivipara*), the blindworm, the black salamander (*Salamandra atra*), one of the blennies (*Zoarces viviparus*), and many invertebrates which bring forth already hatched young, not so much in the manner of birth as in the relation between mother and offspring before birth; (3) that oviparous and viviparous parturition often occur in the same class—witness the oviparous Monotremes among mammals; (4) that oviparous and ovoviviparous parturition often occur in nearly related forms among reptiles, fishes, amphibians, and invertebrates—that they even occur in the same animal: e.g. the grass-snake (*Tropidonotus natrix*), which usually lays eggs, but may in artificial conditions bear already hatched young; or some aphides in which the parthenogenetic generations are usually born as young insects, while the fertilised eggs are laid as such. In short, the distinctions are for the most part differences of degree.

Ovoca. See AVOCA.

Ovule, a little egg; in Botany the rudimentary seed. It needs to be fertilised by the pollen tube before it can develop and grow into the seed. The ovule has a complicated structure which can only be properly understood by comparing it with the corresponding parts of the lower plants known as the Vascular Cryptogams. In the common Ferns (q.v.), when a spore is sown a small green plant, the prothallium, grows from it; this bears male and female organs called antheridia and archegonia. A male sperm from an antheridium fertilises the egg-cell of an archegonium, and a plant which we call the fern grows from it. In other plants called heterosporous ferns, because the differentiation into sexes has been carried further back in the life-history of the plant, and the spores are of two kinds, male and female, the female prothallium grows inside the spore-case, bursting it, but not leaving it. In Conifers the prothallium is still more reduced, is surrounded by a mass of tissue called the nucellus, and also by an 'integument.' In ordinary flowering plants the history of the ovule is as follows: On a special leaf called a carpel a mass of tissue grows called the nucellus; this

becomes covered in by two integuments which grow up from its base, but leave an opening at the top called the micropyle. A cell near the top of the nucellus represents the mother-cell of the female spore of the vascular cryptogams. It divides into two and then into four; one of these becomes the female spore; it is called the embryo-sac because the embryo will be formed within it. The male spores of the vascular cryptogams are represented by the pollen grains contained in special leaves called stamens; a pollen grain being placed on a part of the ovary sends out a tube which enters the micropyle. The nucleus of the embryo-sac now divides into two, one daughter-nucleus travels to each end of the sac; it there divides into two, then into four, daughter-nuclei. One of these from each end travels back to the centre of the sac; they fuse and form the secondary nucleus of the sac. The three remaining nuclei at the end near the micropyle are supposed to represent three archegonia; the three at the other end are supposed to represent the rest of the prothallus. Only one of the three archegonia—the inner one, called the oosphere—will develop into the embryo if fertilised; the other two merely aid in that process. Fertilisation is effected by the pollen tube entering by the micropyle and touching one of the outer archegonia, which then breaks up and becomes attached to the oosphere; this is now called oospore, and grows into the embryo, while the secondary nucleus of the embryo-sac by repeated division gives rise to a tissue which fills up the embryo-sac, called endosperm, rich in food materials upon which the embryo feeds. The embryo-sac at the same time grows, displacing the tissue of the nucellus. This is a generalised description. There are variations in the different orders of flowering plants.

Owego, capital of Tioga county, New York, on the Susquehanna River (here bridged), at the mouth of Owego Creek, 228 miles by rail NW. of New York City. It manufactures pianos, flour, soap, leather, &c. Pop. (1890) 8930.

Owen, JOHN, epigrammatist, was born at Armon, in Carnarvonshire, in 1560, and had his education at Winchester and New College, Oxford, where he became a Fellow in 1584. He was afterwards a schoolmaster at Warwick, died in 1622, and was buried in St Paul's Cathedral. He had a great reputation in his day as a writer of Latin verse, and as the 'British Martial' his fame as an epigrammatist was widely spread also on the Continent. His robust Protestantism sharpened into stinging wit placed his book on the *Roman Index* in 1654. Three books of the *Epigrammata* appeared in 1606; additions were made in later editions. The best edition is that by Renouard (Paris, 2 vols. 1795). An English translation was published as early as 1619. See EPIGRAM.

Owen, JOHN, a great Puritan divine, was born at the vicarage of Stadham, in Oxfordshire, in 1616. At twelve he was admitted at Queen's College, Oxford, where he worked with amazing diligence, for years taking no more than four hours' sleep a night. In 1632 he took his B.A. degree, and M.A. in 1635, and two years after was driven from Oxford by dislike to Laud's new statutes. The next three or four years of his life were spent in a state of anxious and melancholy introspection, as chaplain first to Sir Robert Dormer of Ascot, next to Lord Lovelace of Hurley; but the outbreak of the war left him without a patron, and about the same time his zealous Puritanism cost him the estate a wealthy Welsh uncle meant to have bequeathed him. He now removed to London, where a casual sermon, preached by a stranger in Calamy's church, brought to his heart that peace he had long laboured

after in vain. In 1642 he published *The Display of Arminianism*, a work for which the 'Committee for Purging the Church of Scandalous Ministers' rewarded him with the living of Fordham in Essex. Here he married a lady named Rooke, who bore him eleven children. In 1646 he removed to Coggeshall, and here made public his growing aversion to Presbyterianism, and preference for a moderate form of Independent church government. The Presbyterian ministers fell upon him at once for his apostasy, but all their acrimony, dogmatism, and intolerance failed to perturb his sober temper. At Coggeshall he wrote his *Salus Electorum, Sanguis Jesu*, the result of seven years' study, and of which he himself said that 'he did not believe he should live to see a solid answer given to it.' On April 29, 1646, he preached before parliament, and to his discourse, when printed under the title of *A Vision of Free Mercy*, he added an Appendix in which he pleads for liberty of conscience in matters of religion. He was again chosen to preach before the House of Commons the day after the execution of King Charles I. (January 31, 1649), but discreetly avoided a vindication of the act by making no reference to it whatever. About this time Cromwell made his acquaintance, and thought so highly both of his preaching and character that he carried him to Ireland as his chaplain. Here he remained about half a year, regulating the affairs of Trinity College. Next year (1650) he went with Cromwell to Scotland, and resided in Edinburgh for several months. In 1651 the House of Commons appointed him dean of Christ Church, Oxford, and in 1652 he was admitted vice-chancellor of the university. The manner in which he discharged his duties reflects the highest credit on his moderation and impartiality. Most of the vacant livings in his patronage were bestowed on Presbyterians; and Episcopalians were allowed to celebrate divine worship in their own way, nor could the vice-chancellor ever be induced to offer them the slightest molestation. While at Oxford the 'Atlas of Independence,' as Wood styles him, wrote his *Diatriba de Divina Justitia*, his *Doctrine of the Saints' Perseverance*, his *Vindiciæ Evangelicæ*—against Biddle and the Socinians—and his *Mortification of Sin in Believers*. He was one of the well-known Triers appointed to purge the church of scandalous ministers, and in this capacity signalised himself by his friendly offices on behalf of men of learning and merit like Dr Edward Pocock, Laud's professor of Arabic. Owen opposed the giving the crown to the Protector, and it appears that a coldness arose between the two. In 1657 he was succeeded as vice-chancellor of the university by Dr Conant, and the year after Cromwell's death he was ejected from his deanery. He retired to Stadham, in Oxfordshire, where he had purchased an estate, and here he formed a congregation, to which he ministered until his removal to London shortly after the Restoration. The writings belonging to this period of retirement are *Communion with God; On the Divine Original, Authority, Self-evidencing Light and Power of the Scriptures; Theologoumena, or De Natura, Ortu, Progressu, et Studio Veræ Theologiæ*; and an uncritical and irreflective diatribe against Walton's *Polyglott*. In 1662 he published, at Clarendon's request, *Animadversions to Fiat Lux*, a treatise written by a Franciscan friar in the interests of Roman Catholicism. It was followed by works on *Indwelling Sin*, on the 130th Psalm, and on the Epistle to the Hebrews, the last of which began to appear in 1668, and is usually reckoned Owen's greatest work. In 1669 he published *Truth and Innocence Vindicated*, a reply to Samuel (afterwards Bishop) Parker's *Discourse on Ecclesiastical Policy*, and in 1673 became

pastor of a large congregation in Leadenhall Street. His last publications of importance were a *Discourse Concerning the Holy Spirit* (1674); *Doctrine of Justification by Faith* (1677), a treatise still much admired by many; and *Christologia, or Glorious Mystery of the Person of Christ*.

Already in 1663 he had declined a call to Boston in New England, as he did an invitation in 1670 to become president of Harvard. In his later years he was held in the highest esteem by many of the most influential personages in the land, and he had repeatedly long conversations with both Charles II. and the Duke of York on the subject of Nonconformity. In his controversies with Sherlock and Stillingfleet he came off triumphant, and to the end of life he preached and wrote incessantly, notwithstanding the torments of the stone and asthma. He died at Ealing, 24th August 1683, and was buried in Bunhill Fields, being followed to the grave we are told by as many as sixty noblemen. Owen was the most voluminous, but by no means the most powerful writer among the Puritan divines. His prolix and passionless disquisitions, his dull, tedious, and exhausting argumentations, his lack of subtle spiritual perception, his ponderous and lumbering style make his writings the reverse of interesting; and one can almost pardon the irreverent criticism of Robert Hall, who pronounced them 'a continent of mud.' Yet Owen deserves respect for his learning and moderation, and for the nobility of his private character.

For his life, see the Rev. W. Orme's *Memoirs* (1820), and the *Life* by the Rev. A. Thomson, prefixed to the most complete edition of Owen's more than eighty works, that edited by Dr Goold (24 vols. Edin. 1850-55).

Owen, Sir Richard, one of the most eminent of zoologists, was born at Lancaster, July 20, 1804. From the grammar-school of that town he passed (1824) to Edinburgh University and extra-mural School of Medicine, and thence (1828) to St Bartholomew's Hospital in London, where he completed his course. He had barely started medical practice when he was called (1830) to help in cataloguing the Hunterian collections in the museum of the Royal College of Surgeons, to the curatorship of which he afterwards succeeded. In 1835 he married the only daughter of Clift, his colleague in the museum. Till 1856 he continued to produce a marvellous series of descriptive catalogues, while for more than twenty years (1834-55) he lectured as professor of Comparative Anatomy, for two years at Bartholomew's, and afterwards as Sir Charles Bell's successor at the College of Surgeons. Some of the results of his research and teaching are embodied in several well-known volumes on comparative anatomy and physiology. Meanwhile he had helped to give new life to the Zoological Society of London, of which he was for a time the unpaid prosector, while he had also worked willingly in various public interests—e.g. as a commissioner of health (1843-46), and for the Great Exhibition of 1851. In 1856 he became superintendent of the natural history department of the British Museum, where he continued his investigations on living and fossil animals, energetic moreover in such practical matters as the fit housing of this magnificent collection. He also continued to teach periodically at the Royal Institution and elsewhere, until his resignation of official duties in 1883. But even thereafter the veteran of fourscore years and more has persisted at work. Elected a Fellow of the Royal Society in 1834, president of the British Association in 1857, Associate of the French Institute in 1859, a Companion of the Bath in 1873, a K.C.B. in 1883, recipient of many scientific medals, degrees, and honorary titles from many nations, he gained above all the immortality of a true worker.

As a student Owen had also visited Paris and seen Cuvier, of whose school he became a prominent disciple, yet in his theoretical conclusions he rather supported Geoffroy St-Hilaire, against whose principle of the unity of organic structure he had heard Cuvier argue in 1831 before the French Academy. Marvellous industry and width of knowledge, anatomical insight and enthusiasm for palæontology, were as characteristic of Owen as of Cuvier, and their names will be linked while zoology lasts. Owen's anatomical and palæontological researches number towards four hundred, and concern almost every class of animals from sponge to man; he helped to elucidate the structure of many rare and interesting types, such as the Venus-flower-basket (*Euptectella*), the Brachiopod *Lingula*, the King-crab (*Limulus*), the Pearly Nautilus and the Argonaut, the Mud-fish *Protopterus*, many extinct reptiles and birds, the recently-lost Moa and the persistent Apteryx, the Aye-Aye and the Gorilla; he greatly advanced morphological enquiry by his clear distinction between *analogy* and *homology*, as well as by his concrete studies on the nature of limbs, on the composition of the skull, and on other problems of vertebrate morphology; while his essay on *Parthenogenesis* was a pioneer work of much historical importance in connection with theories of sex and reproduction. As a Pre-Darwinian, much influenced by the conception of 'archetypes,' Owen maintained a cautious, though by no means hostile, attitude to the more detailed evolutionist theories; his convictions, in short, are those of a Platonic anatomist. See a sketch of his life, with portrait, in *Nature*, xxii. (1880).

Owen, Robert, social reformer, was born a saddler and ironmonger's son, at Newtown, in Montgomeryshire, 14th May 1771. He had a poor education, and was put at ten into a draper's shop at Stamford, but a few years later shifted to Manchester, and by nineteen had risen to be the enterprising manager of a cotton-mill with five hundred hands. In 1799 he married the daughter of David Dale (q.v.), the philanthropic owner of the celebrated cotton-mills at New Lanark, on the Clyde, and, having induced his firm to purchase the concern, settled there next year as manager and part-owner. Here he laboured with constant zeal to teach his workpeople the advantages of thrift, cleanliness, and good order, and organised with a wisdom far before his time a system of infant education. In 1813 the business was reorganised, so as to give Owen a freer hand for his philanthropic schemes, under a firm content with a profit of 5 per cent., of which Jeremy Bentham and the Quaker William Allen were members. By this time Owen had thought out a religious creed for himself, and he now began his social propagandism in *A New View of Society, or Essays on the Principle of the Formation of the Human Character* (1813). His works at New Lanark quickly became famous, and attracted visitors from all parts of the world, while his advice on social questions was sought, if not always followed, by statesmen. Owen's thoughts on the pressing social questions of the day finally drove him to socialism rather than co-operation as a solution, but he lost much of his influence on the wider community by utterances on religion that were at least honest, if not discreet. His socialistic theories were put to the test of practice in experimental communities at Orbiston near Bothwell, and later at New Harmony in Indiana, at Ralahine in County Clare, and at Tytherly in Hampshire, but all were completely unsuccessful. In 1828 his connection with New Lanark finally ceased; and, his means having been exhausted in the American experiment, the remainder of his days were spent in restless secularist and socialistic

propagandism. In his old age his mind fell into the comfortless vagaries of spiritualism. He died at his native town, 17th November 1858.—His son, ROBERT DALE OWEN, was born in Glasgow, 9th November 1800, and went to America in 1825 to help his father in founding his short-lived colony at New Harmony, Indiana. He finally settled in America in 1827, edited the *Free Inquirer* in New York, acted as a member of the Indiana legislature, and entered congress as a democrat in 1843. Later he helped to remodel the constitution of Indiana; acted first as *chargé d'affaires*, next as minister at Naples (1853–58); debated divorce with Horace Greeley; supported the cause of emancipation by vigorous and able pamphlets; and made his name widely known as one of the chief advocates of spiritualism in the United States. He died on Lake George, New York, 17th June 1877. Of his books need only be mentioned the spiritualistic *Footprints on the Boundary of another World* (1859), and *Debatable Land between this World and the Next* (1872); and *Threading my Way*, an autobiography (1874).—Two other sons, David Dale Owen (1807–60) and Richard Owen (born 1810), achieved contemporary eminence as geologists.

See SOCIALISM; G. J. Holyoake, *History of Co-operation in England* (1875); Owen's Autobiography (1857), and further, that edited by his son (1874); also the *Lives* by A. J. Booth (1869), W. L. Sargent (1860), and Lloyd Jones (ed. by W. C. Jones, 1890).

Owensboro, capital of Daviess county, Kentucky, on the Ohio, 160 miles below Louisville (112 by rail); a steam-ferry plies to Indiana. The chief trade is in tobacco and whisky, there being over a score of tobacco-factories and nearly as many distilleries here and in the vicinity. The city has also foundries, and flour and planing mills, &c. Pop. (1880) 6231; (1890) 9837.

Owens College, Manchester, which has developed into the VICTORIA UNIVERSITY, owes its origin to John Owens, a Manchester cotton-spinner, who, dying in 1846, left his fortune (£96,654) for the foundation of a college on an absolutely unsectarian basis, free from all tests of creed or subscription. By 1851 the college was built and opened with two faculties—(1) arts, science, and law, and (2) medicine (now including a school of pharmacy and a dental-surgery department); in 1873 the new college buildings were constructed, and the number of students was 1004; in 1891 they numbered 811, besides 439 evening students, and there were about eighty lecturers.

In 1874 Charles Clifton of Jersey City, United States, bequeathed his residuary estate (£21,571) for the extension of the department of mechanical arts and engineering, and in 1876 Charles Beyer of Manchester left to it by will £100,243. Other benefactions and subscriptions produced over £260,000 for its development and endowment. The idea of a university at Manchester, which had been mooted so long ago as 1641, and revived in 1789 and 1836, was at length carried out. In 1880 the Victoria University was fairly launched, though at first without the power of granting degrees in medicine and surgery. This last restriction was removed in 1883. The senate consists of the principal and the professors for the time being. The characteristic features of the university, as compared with other British universities, are these: (1) It does not, like London, confer degrees on candidates who have passed certain examinations only, but it also requires attendance on prescribed courses of academic study in a college of the university; (2) the constitution of the university contemplates its ultimately becoming a federation of colleges; but these colleges will not be situated like those of Oxford and Cambridge in one town, but wherever a college of adequate efficiency and

stability shall have arisen. Besides Owens College, the Yorkshire College at Leeds and University College, Liverpool, have been already admitted, and in 1883 the Manchester and Salford College for Women was incorporated with it. Women enjoy full rights of studying, except the right to use the laboratories. There are two permanent fellowships, two others not endowed, and from thirty to forty scholarships and prizes. Many of these last, together with one of the fellowships, are open to competition by women as well as men. See *Owens College: its Foundation and Growth*, by Joseph Thompson (Manchester, 1886).

Owen Sound, a town and port of entry of Ontario, at the head of Georgian Bay, 122 miles by rail NW. of Toronto. It possesses a deep sheltered harbour (12 miles by 5), and has a large trade in lumber and grain, besides manufactures of furniture and wooden wares, machinery, woollen goods, &c. The Canadian Pacific steamers leave here for Port Arthur. Pop. 6000.

Owl (*Striges*), a sub-order of birds, constituting with two other sub-orders—the Pandionides (ospreys) and Falcones (hawks, falcons, and eagles)—the order Accipitres or Raptores (birds of prey). The owls, generally spoken of as 'the nocturnal birds of prey,' are distinguished by many well-marked characters. In size they vary from 5 inches to 2 feet in length, the females being as a rule larger than the males. The head is very large; the skull is broad, and the cranial bones are highly pneumatic; the facial region is flattened; the beak is short, hooked, strong, and sharp, never notched; at its base are bristles covering, more or less completely, both the cere and the nostrils. The eyes are very large, directed forwards, goggle-like, only slightly movable on account of the bony sclerotic plates being fixed firmly to one another and to the orbit; the upper eyelid is very large, and is the one principally concerned in closing the eye; both eyelids are ciliated with barbed plumelets and have a broad, thin, bare margin; the third eyelid, or nictitating membrane, is conspicuous; the iris is unusually broad, and is capable of being greatly expanded and contracted; the pupil is oval with the long axis perpendicular. A disc of feathers surrounds the eye, either completely or partly, and is supported by a ruff made up of rows of small, much-curved feathers inserted into the skin by stiff shafts. The ear is peculiar and variable; it has an external meatus, unusual in birds, generally of large size, and sometimes provided with a special flap of skin or operculum. The head often bears a pair of tufts known as feathered horns. The neck appears short, sometimes extremely so. The body, though really small, is apparently full, being covered with soft downy feathers without after-shafts. The plumage is generally spotted or barred with different shades of brown and yellow. In nearly all owls two different phases of colour, a darker and a lighter, can be distinguished, the two phases being often observed in different individuals of the same brood. The wings are always broad and long and loose. The tail is usually short and even, or slightly rounded. The oil-gland is destitute of the usual cirlet of plumes. The legs are not long, and are almost completely feathered. The toes are often covered with feathers, and are always terminated by strong talons; the first and fourth toes can be opposed to the second and third. The mouth is very wide; the gullet is large; there is no crop; the stomach is large, roundish, and somewhat compressed; the intestine is short, and has two wide caeca connected with it. The indigestible portions of food are regurgitated in the form of pellets as in other Accipitres.

Owls range over the whole globe, from the extreme

polar regions to the remotest oceanic islands. No birds are more cosmopolitan in their distribution. In habit they are generally nocturnal; their flight is noiseless and buoyant; their eyesight is very acute, as is also their sense of hearing. They are either solitary or live in pairs, and although so often regarded with superstitious aversion and animosity, they are nearly always harmless and very useful birds. Their food consists of small mammals, birds, insects—especially nocturnal lepidoptera; and some species prey on fish, either habitually or occasionally. They pounce upon their prey noiselessly, and, striking their talons into it, kill it and carry it off. Small animals may be carried in their bill, and are swallowed whole; larger animals, torn in pieces, are eaten in morsels. The disgorged pellets of indigestible materials—bones, fur, and feathers—produce a characteristic fetid odour near the owl's abode. The examination by Dr Altam of remains found (communicated to the German Ornithologists' Society) gives a good idea of the food and utility of the three commonest species of British owls.

The nesting habits of owls vary considerably. The nest is rudely made of twigs and grass, in holes of trees, crevices of rocks, dark corners of buildings, or on the ground; sometimes there is no nest at all, or only the forsaken one of some other bird. The eggs are usually white, either pure or yellow or blue tinted, and almost spherical, commonly four to six in number, but some species lay eight or ten, others not more than two. The young remain long in the nest, and are helped by their parents for some days after going abroad. Some owls are diurnal in habit, and these have more compact plumage, smaller ears, and incomplete discs; but the habits of owls in general are too little known to allow of many general statements being made regarding the adaptation of structures to particular habits. Though the small and unspecialised ear is said to characterise diurnal species, it is found in the eagle-owl, whose habits are nocturnal. Unfeathered legs are sometimes associated with fishing habits; but some feather-legged species catch fish, while other species with unfeathered legs do not. And again, feathered horns, which have sometimes been considered characters sufficiently important to serve as a basis for classification, have no known function, occur in widely-different species, vary much in size and form, and are not peculiar to either males or females. During the day nocturnal owls repose in some secluded spot, generally in a tree, but often on rocks and bushy cliffs, while some prefer the ground. If found abroad they are persecuted by other and smaller birds, being bewildered and rendered helpless by the unaccustomed glare of the daylight. When surprised, owls hiss like a cat and make a clicking noise with their bills; some have a harsh shrieking cry, others a not unmusical *hoot*.

The classification of the owls is at present in a very unsatisfactory state, owing to the difficulty of estimating properly the classification value of the various anatomical characters. According to the most generally received method (Sharpe's, in the *Catalogue of Birds in the British Museum*, vol. ii.), the sub-order Striges is subdivided into two families—(1) Strigidae, containing only the two genera *Strix* and *Phodilus*, which embrace six species; (2) Bubonidae, containing all the other owls—17 genera and about 190 species. (Newton

subdivides the owls, which he reckons as a family of Accipitres, into two sub-families—(1) Aluconinae, corresponding to the Strigidae of Sharpe; and (2) Striginæ, corresponding to the Bubonidae.) In the Strigidae the sternum has no manubrium, and its margin is entire behind; the clavicles meet to form a furcula or merrythought, which is firmly united with the keel of the sternum; the tarsus is without a bony arch over the extensor tendon of the toes; and the claw of the mid-toe has its inner margin serrate. In the Bubonidae, on the other hand, the sternum has a distinct manubrium, and has its margin notched behind; the clavicles are small and do not form a furcula, nor are they united with the sternum; the tarsus has a bony arch or ring over the groove which contains the common extensor of the toes; and the inner margin of the middle claw is not serrate.

The only British representative of the family Strigidae is the Barn-owl, White Owl, Screech-owl, or Church-owl (*Strix flammea* of Linnaeus). This, although the commonest British owl, is really a tropical bird, not ranging more than 40° north or south of the equator, except in western Europe,

where it breeds as far north as Denmark and the south of Sweden. In Scotland it is found in the Inner Hebrides, Caithness, and the Shetland Isles. The adult male is about 13 inches long; the bill is white; the claws purplish gray; the face discs, which are oval in form and complete, are white. The general colour, which is light reddish yellow, mottled with gray on the upper parts, and white with small dusky spots on the under parts, distinguishes it from all other owls. The female is larger, but differs little in colour, except that the upper parts are darker. This owl is pre-eminently nocturnal in habit. It frequents villages, home-steads, and ruins, where it carries on its depredations among rats, mice, and other animals—as many as twenty rats have been found in the nest of one, all freshly killed. It has also been known to catch fish. Its cry is a discordant scream, and it also produces a snoring and hissing noise. If a nest is made it is merely a loosely-arranged collection of twigs and straws. The eggs number two to five, and are large and smooth and white. Several broods of young may be produced annually. Phodilus, the other genus of the Strigidae, consists of only one species (*P. badius*), which ranges from the eastern Himalaya to Burma and Pegu, and is also found in Ceylon, Java, and Borneo. This genus possesses characters common to both families, and is really an intermediate form belonging properly to neither. A species from Madagascar, described by Alphonse Milne-Edwards under the name of *Heliodilus soumagnii*, has been placed in this sub-family.

Fig. 1.—Barn-owl (*Strix flammea*).

Among the Bubonidae the Tawny Owl, Wood-owl, Ivy-owl, Brown Owl (*Strix stridula* or *aluco*, or *Syrnium aluco*) is a very common British species. It is found chiefly in wooded parts of England, and in the midland and southern districts of Scotland,

but also as far north as Caithness and the Inner Hebrides. Its cry *hoo-hoo*, or *tu-whit, tu-whoo* at night makes it easily recognised. Although a species deserving to be preserved, it is rapidly declining in numbers. It ranges from the southern parts of Scandinavia through temperate Europe, in some parts of which, however, it is very local, to Asia Minor, Palestine, and Barbary. The Snowy Day-owl, the *Harfang* of the Swedes (*Strix* or *Surnia nyctea* or *Nyctea scandiaca*), is a circumpolar bird, breeding chiefly within the Arctic Circle, and common in parts of Greenland and Iceland. Its home is on the fjelds of Lapland, the tundras of Russia and Siberia, and the prairies of Arctic America, where it feeds on lemmings and other small rodents, sometimes on ptarmigan

Fig. 2.—Heads of *a*, Short-eared Owl; *b*, Long-eared Owl; and *c*, Snowy Owl.

and willow-grouse, and even on the Arctic hare and on fish. In Shetland, where it has been known to breed, forced from its home by exceptional cold, and in other parts of the British Islands it is found generally in solitary, stony, and elevated places, preying chiefly on sandpipers. It is a diurnal bird of large size and vigorous rapid flight, with strong limbs, toes completely feathered, and large talons. Its white plumage, generally marked with dusky-brown spots, distinguishes it from every other owl. The Long-eared and Short-eared Owls of Europe, Asia, and America (*Asio otus* and *A. accipitrinus*), which are also common British species, have the ear peculiarly developed, the opening on one side looking upwards, and on the other downwards. The Long-eared owl, which frequents wooded localities, is about the size of the Barn-owl, and generally carries its horns erect;

Fig. 3.
Foot of Snowy Owl.

while the Short-eared, known also as the Woodcock-owl, from the coincidence of its time of appearance, prefers moors and open country, and carries its horns depressed. The specialisation of ear-structure is carried to its greatest known limit in Tengmalm's owl (*Nyctala tengmalmi*), a rare visitor to Britain from the northern regions; in it the bones of the head are developed differently on each side. The Eagle-owl (q.v., *Bubo maximus*), the Little Owl (*Athene noctua*), the Hawk-owl (*Surnia funerea*), and the very small Scops-owl (*Scops giu*) are the only other species recorded as found in Britain, and these are all very rare. Of foreign species belonging to this family one of the most noteworthy is the Burrowing Owl (*Speotylo* or *Athene cucularia*) of America. On the prairies of North America it shares the burrows of the prairie-dog and other mammals, while on the pampas of South America it lives in the holes of the viscacha, armadillos, and large lizards, or makes a hole for itself, which is often invaded by rattlesnakes. Another interesting species is Pel's Fish-owl (*Scotopelia peli*).

Owosso, or OWASSO, a city of Michigan, on the Shiawassee River, 78 miles by rail N.W. of Detroit. The river supplies abundant water-power, and there are flour and planing mills, and furniture and sash and blind factories, besides foundries and railway-shops. Pop. (1890) 6544.

Ox. See CATTLE and BOVIDÆ.

Oxalic Acid, $H_2C_2O_4 + 2H_2O$, occurs in colourless, transparent, oblique, rhombic prisms, which have an intensely sour taste, and are soluble in nine parts of cold water, and much more freely in boiling water. When heated to 212° (100° C.) the crystals lose their two equivalents (or 28.5 per cent.) of water, and the residue, consisting of the anhydrous acid, $H_2C_2O_4$, becomes opaque. When the crystallised acid is rapidly heated to about 300° (149° C.), or when it is warmed with strong sulphuric acid, it is decomposed into carbonic acid and carbonic oxide gases, and into water. Oxidising agents, such as binoxide of manganese, peroxide of lead, nitric acid, &c., convert oxalic into carbonic acid, and on this property is based a good method of determining the commercial value of the black oxide of manganese. One of the most powerful of the organic acids, it expels carbonic acid and many other acids from their salts. The acid itself, which, like its soluble salts, is poisonous, is very widely diffused throughout the vegetable kingdom, sometimes in the free state, but more frequently as a salt of lime, as in rhubarb and many lichens. In the animal kingdom it never occurs except in minute quantity, and in combination with lime. It is produced by the action of either caustic potash or nitric acid upon most organic compounds of natural occurrence. Its most common mode of preparation is by the oxidation of starch or sugar by nitric acid. The organic compound and the nitric acid are heated in a flask till all effervescence has ceased, after which the solution is evaporated, and the oxalic acid separates in crystals on cooling. The most important salts are the oxalate of ammonia, $(NH_4)_2C_2O_4 + H_2O$, used as a test for lime, and the binoxalate of potash or salt of sorrel, $KHC_2O_4 + H_2O$, also known as essential salt of lemons, and which is popularly used for removing ink-stains or for cleaning brass.

The best test for this acid is the production of a white precipitate (of oxalate of lime), on the addition of any soluble salt of calcium. The precipitate is insoluble in water, in solution of potash, and in acetic acid, but dissolves in the mineral acids. A solution of nitrate of silver also gives a white precipitate of oxalate of silver, which explodes when heated.

In consequence of its employment in cotton-printing, bleaching straw, &c., oxalic acid is more accessible to the general public than many other poisons; and on this account instances of suicide from the swallowing of this acid are by no means uncommon. Cases of accidental poisoning, moreover, sometimes occur from its being sold by mistake for Epsom salts. Large doses destroy life very rapidly. With the view of converting the free acid in the stomach into an insoluble and inert salt, chalk, whiting, or lime-water, with full draughts of milk, should be administered with the least possible delay. Salt of sorrel is almost as poisonous as the pure acid.

Oxalideæ, or OXALIDACEÆ, a natural order of exogenous plants, allied to Geraniaceæ; including herbaceous plants, shrubs, and trees; with generally compound alternate leaves; calyx of five equal persistent sepals; corolla of five equal unguiculate petals, spirally twisted in bud; ten stamens; the ovary five-celled, with five styles; the fruit a capsule of five cells opening by five valves, or more rarely a berry with five one- or many-seeded

cells. Temperate North America and the Cape of Good Hope may be said to be the headquarters of the order. The herbaceous parts of almost all the species are distinguished by a strong acidity, which is owing to the presence of oxalate of potash; some, however, are bitter and slightly stimulating. The fruit of some is pleasantly acid and cooling—as *Carambola*—and reputed to be antiscorbutic and antiseptic. The tubers of several of the typical genus (*Oxalis*) are eatable, and contain a considerable quantity of starchy matter. The leaves of all the species are more or less sensitive. The Wood-sorrel (*O. acetosella*) is a native of Britain, and one of the most elegant of the wild flowers, carpeting woods and shady places with its bright trifoliate leaves and white or rose-tinted flowers. Its leaves, resembling as they do those of the clover, have led to the surmise that it may be the true Shamrock (q.v.). The plant, which is antiscorbutic and refrigerant, is widely distributed throughout Europe, Russian and central Asia, and northern America. It is much used in salads on the Continent; and in Lapland, where it is very abundant, it is the favourite herb of the inhabitants. The expressed juice of the plant abounds in binoxalate of potash. Twenty pounds of fresh leaves yield about six pounds of juice, from which is obtained about two ounces of the pure salt.—*Salt of Sorrel* and *Essential Salt of Lemons* (see OXALIC ACID). The preparation is carried on mainly in Switzerland and Germany; not, however, exclusively from this species of *Oxalis*, but from several other species of the same genus and of the true sorrels (*Rumex*), which contain the same salt. The numerous species of *Oxalis* strongly resemble each other in their general appearance and properties. Several of them, such as *O. crenata* and *O. tuberosa*, natives of Peru and Bolivia, and *O. Deppei*, a Mexican species, are cultivated in those countries for the sake of their tuberous roots, which are eatable. These species have all been recommended for culture in Britain as substitutes for the potato, but their produce is too meagre to deserve attention; besides, the plants are constitutionally adapted only to the most favourable parts of England. *Averrhoa bilimbi*, or Cucumber-tree, indigenous to the East Indies, and now cultivated in some parts of South America, produces a green fleshy fruit of the shape and size of a small cucumber, which is esteemed for its grateful acid juice when ripe. The unripe fruit is also pickled.

Oxaluria, the occurrence of crystals of oxalate of lime in the Urine (q.v.).

Oxenford, JOHN, dramatist and critic, was born in Camberwell in 1812, and was originally educated for the bar, but early turned to a life of letters, made himself familiar with French, German, and Spanish literature, and soon made his name known by admirable translations of such notable books as Goethe's *Dichtung und Wahrheit* and Eckermann's *Conversations with Goethe*. For his last thirty years he was dramatic critic for the *Times*, and his criticisms were ever characteristic of the genial kindness of his nature. He was a fluent and graceful writer, yet his original work suggested rather than demonstrated his powers as a critic. His *Illustrated Book of French Songs* (1855) showed a dexterous mastery of the lighter forms of verse. He wrote many plays, among them the *Dice of Death*, the *Reigning Favourite*, the *Two Orphans*, as well as the libretto for *The Lily of Killarney*, and one farce at least, *Twice Killed*, that became widely popular. He died February 21, 1877.

Oxenham, HENRY NUTCOMBE, theologian, was born at Harrow, November 15, 1829, and educated at Balliol College, Oxford, taking a classical second-

class in 1850. He took orders in 1854, and held various curacies, but entered the Roman Catholic Church in 1857, and was successively professor at St Edmund's College, Ware, and master at the Oratory School, Birmingham. He died March 23, 1888. Oxenham translated Döllinger's *First Age of the Church* (1866), and *Lectures on Re-union of the Churches* (1872), also vol. ii. of Hefele's *History of the Councils of the Church* (1876); and, besides frequent articles in the leading reviews, the following learned works came from his pen: *Catholic Doctrine of the Atonement* (1865); *Catholic Eschatology and Universalism* (1876); *Short Studies in Ecclesiastical History and Biography* (1884); and *Short Studies, Ethical and Religious* (1885).

Oxenstierna, or OXENSTERN, AXEL, COUNT, Swedish statesman, was born at Fänö, north of Stockholm, 16th June 1583. He was originally educated for the church, and studied theology as well as jurisprudence at Rostock, Jena, and Wittenberg, and, although he entered (1602) the public service of his country, he continued all his life to take a deep interest in religious questions, and laboured zealously for the extension of the Protestant doctrines. Charles IX. despatched him in 1606 as ambassador to the court of Mecklenburg, and made him senator in 1609. Having displayed great prudence and wisdom in the settlement of disputes between the Livonian nobles and the town of Reval, he was appointed by Charles—now infirm from age—guardian of the royal family and head of the regency. On the accession of Gustavus Adolphus (q.v.) in 1611 Oxenstierna was created chancellor; and in 1613 acted as minister-plenipotentiary in the negotiations for peace between Sweden and Denmark, and in 1617 in those which terminated hostilities between Sweden and Russia. In 1621, on the departure of the king for the Polish war, Oxenstierna was charged with the administration of affairs at home, but five years later was summoned to act as governor-general of the conquered districts in Prussia. In 1629 he concluded peace with the Poles on highly favourable conditions. Although he strongly opposed the desire of Gustavus to take part in the Thirty Years' War, yet, when he found that the Protestant sympathies of the king were irrepressible, he supported his master most faithfully and ably; Gustavus in return charged him with the difficult business of managing the diplomatic relations of Sweden in central Germany. After the king's death it was Oxenstierna who not only kept the Swedish armies together, but sustained the Protestant cause and prevented it going to pieces on the jealousies of the German Protestant princes, displaying masterly diplomatic ability, great courage, resource, and moderation. Having in four arduous years reorganised the Protestants and reanimated their courage by gaining French and Dutch assistance, he went back to Sweden (1636). He had already drawn up a constitution, which the estates accepted and ratified in 1634. After his return he resumed the duties of chancellor, adding to them those of guardian to the young queen Christina, who, however, did not accept the advice of her father's wise friend and counsellor as it becomed her. Oxenstierna continued to direct the policy of the Protestants in Germany till the peace of Westphalia in 1648 put an end to the war. He humiliated the Danes and forced them to sign the treaty of Brömsebro (1645), and opposed the abdication of Christina and the succession of Charles X. This king, nevertheless, retained him in office until he died, 28th August 1654. See Lundblad's *Svensk Plutarch* (2 vols. Stock. 1824); Fryxell's *History of Gustavus Adolphus*; Geijer's *History of the Swedes* (Lond. n.d.); and *Journal of Bulstrode Whitelocke* (1772). His *Writings and Correspondence*

began to appear in 1888.—His eldest son JOHAN (1611–57) carried through several diplomatic missions, his greatest service being to act as Sweden's plenipotentiary at Osnabrück (1648). It was in a letter to this son, who felt himself unequal to the office, that the chancellor used the famous phrase, 'Nescis, mi fili, quam parva sapientia regitur mundus.' This aphorism is current, however, in an extraordinary number of versions (*Notes and Queries*, 7th July 1888).—The younger brother ERIK (1624–56) was governor of Esthonia (1640), and succeeded his father as chancellor of the kingdom.

Ox-eye. See CHRYSANTHEMUM.

Oxford, the capital of the county, the home of the university, and the seat of the bishopric of the same name, stands about the confluence of the rivers Cherwell and Thames, 52 miles (63 by rail) WNW. from London. The city, under the Act of 1889, is governed by a council, comprising a mayor, fifteen aldermen, and forty-five councillors, of whom three aldermen and nine councillors are elected by the university. Up to 1885 the city returned two members to parliament; since that date only one. Until about 1830 the area and population of the city remained almost stationary, extending only a little beyond the limit of the old city wall as reconstructed in the reign of Henry

review all the chief buildings and places of interest. *North* runs Cornmarket Street ('the Corn'), containing the Roebuck and Clarendon Hotels, past the latter of which is the entrance to the Oxford Union Society's rooms (the club, library, and debating-hall of the undergraduates, founded in 1823). At the end of Cornmarket Street is St Michael's Church, the tower of which (c. 1070) is a characteristic specimen of Saxon masonry. Here formerly was the north gate of the city, the chambers over which (taken down in 1771) were used as a prison, and called Bocardo. From the end of Cornmarket Street, George Street runs west, containing the New Theatre (1886) and the High School for boys (1881); Broad Street runs east, containing Balliol, Trinity, and Exeter Colleges, the Ashmolean Museum, the Sheldonian (the University 'Theatre'), the Clarendon Building (used for the Clarendon Press till 1830, now as university committee-rooms), and the Indian Institute (a library, museum, &c., for natives of India and members of the Indian Civil Service studying in Oxford, opened 1884). Broad Street was the place where the Oxford martyrs were burned (Ridley and Latimer on 16th October 1555, and Cranmer on 21st March 1556). The Martyrs' Memorial, a cross in their honour, was built in 1841, at the end of Magdalen Street, the continuation of Cornmarket Street. Beaumont Street leads west from this point, past the Randolph Hotel (built 1864), the Taylor Library (for modern literatures, founded by Sir Robert Taylor, built 1845), and the University Galleries (containing the Ruskin Drawing-school, the Arundel Marbles, presented to the university in 1667, and other relics of classical antiquity, a valuable collection of paintings and engravings, and 190 original drawings by Michael Angelo and Raphael), to Worcester College. Thence northwards, by Walton Street, access is got to the University or Clarendon Press (removed to new buildings here in 1830), to St Barnabas Church (1868), to Port Meadow (an extensive flat ground beside the river, being the common of the freemen of the city), and the 'Upper River' or part of the Thames north of Oxford, and so to Godstow, a ruined nunnery, famous as the burial-place of

Brasenose College, Oxford—The Quadrangle (showing also Spire of St Mary's and Dome of Radcliffe Library).

III., and very little beyond the area represented in Loggan's bird's-eye view (1675). But since then the city has grown rapidly, and the rural districts of St Giles' on the north, St Clement's on the west, Grandpont on the south, and Botley on the east have been covered with lines of close-built streets. Pop. (1801) 11,000; (1851) 25,700; (1881) 40,800; (1891) 53,000.

The topography of Oxford is simple in the extreme. The river Thames (locally called the 'Isis'), which has flowed from north to south, takes here a sharp bend to the east, and about a mile from the angle receives the Cherwell, flowing from the north, parallel with its former course. All the old part of the town stands in the rectangle thus formed by the rivers. The centre of the town is at a place called 'Carfax' (derived from *quadri-furcus*, 'four-forked'), from which four main streets run to the four points of the compass. From Carfax, since 1883, tram-lines run to the four points of the compass. Taking in rotation these four lines of streets, we shall be able to pass quickly in

Fair Rosamond. Returning to the Martyrs' Memorial, the street leading north from Magdalen Street (so called from St Mary Magdalene Church), is St Giles' Street, containing St John's College and the Pusey House (a library and clergy-house, in support of Anglican principles, established 1884 in memory of Dr Pusey, and containing his library). In the Woodstock Road continuation of St Giles' Street are the church of St Aloysius (Roman Catholic), built in 1875, the Radcliffe Infirmary (1770), and the Radcliffe Observatory (1795). In the Banbury Road continuation of St Giles' Street are Somerville Hall (a ladies' college, 1879), the High School for girls (1884), and Wycliffe Hall (a Church of England theological college, in the interests of the Evangelical party, 1877). *West*.—Returning to Carfax, and taking another quarter of the city, Queen Street, continued by New Road, leads past the Castle (including the court-house and gaol) to the railway stations, and so along the Seven Bridges Road (across cuts from the Thames) to Cumnor.

South from Carfax runs St Aldate's Street, past the town-hall (built 1752), public library, corn exchange, and post-office (1881), St Aldate's Church (rebuilt since 1863), Pembroke College, the front of Christ Church, the entrance to Christ Church Meadow and Broad Walk, to Folly Bridge across the Thames. This bridge was rebuilt in 1815. Over the old bridge was a watch-tower (taken down in 1779) known as 'Friar Bacon's Study.' From near Folly Bridge, for about a quarter-mile along the north bank of the river, are moored the Barges (q.v.) of the university and college boat-clubs.

East from Carfax runs High Street in a graceful curve. In the High Street itself, or just off it, stand these buildings, in this order from Carfax: the city market (1773), the Mitre Hotel (extant, as Dagville's Inn, before 1470), the church of All Saints (built in 1706 from designs by Dean Aldrich), the new front of Brasenose, the University Church (St Mary the Virgin), where are preached the university sermons (including the 'Bampton Lectures,' q.v.), All Souls, University, and Queen's Colleges, the Examination Schools (1882), with the Non-collegiate Students' buildings, Magdalen College School (founded 1480), Magdalen College, and the Botanic Gardens (laid out in 1632). The street ends with Magdalen Bridge over the Cherwell. From this bridge roads lead to Cowley and Ifley, past the college cricket-grounds and the running-ground of the University Athletic Club. At Cowley is a college for army candidates, called the Oxford Military College, opened in 1876, and the barracks of the Oxford military dépôt. At the church of All Saints, Turl Street runs north from the High, leading to Lincoln, Jesus, and Exeter Colleges, and so into Broad Street at Trinity College. From opposite St Mary's Church, Oriel Street leads south past Oriel College and the Canterbury gate of Christ Church into Merton Street, where are Corpus Christi and Merton Colleges. From St Mary's Church, Catherine or Cat Street leads north, having on the east the Codrington Library (built about 1720 by All Souls College to receive the library of Christopher Codrington, and maintained by the college as a law library), and on the west the Radcliffe Library (built in 1737 as a library for medicine and natural science; since 1861 a reading-room in connection with the Bodleian); and farther on the Old Schools (including the Bodleian Library and the Divinity School) on the west, and Hertford College on the east. Past Hertford College a street leads to New College. Cat Street, after crossing Broad Street, is continued by Park Street, which leads northwards past Wallham College and the garden front of Trinity College to the University Museum, Keble College, and Lady Margaret Hall (a ladies' college, opened about 1880). Here are the University Parks, laid out and kept up by the university. They contain the university observatory, erected in 1874. Here are played most of the football matches (Rugby, Association, Winchester, and other varieties of the game) of the university and college clubs. Here also is the new ground of the University Cricket Club, one of the finest in itself, and in its surroundings, in England. A walk leading from the Parks, east and south, is known as 'Mesopotamia,' being between two cuts of the Cherwell.

ALL SOULS COLLEGE was founded in 1437 by Archbishop Chichele as a chantry for the souls of those who had fallen in the wars with France. It remains still a college entirely of fellows; several of the fellowships have been attached to university professorships. The front quadrangle is practically as the founder left it; the fine chapel (consecrated 1442) contains a beautiful reredos, partially destroyed in 1577 and in 1664, but

restored in 1876. The hall (built in 1720) contains some good portraits of former fellows, among them those of Sir William Blackstone, Reginald Heber, Sir Christopher Wren, Thomas Tanner, John Linacre, Jeremy Taylor, and Herriek.

ASHMOLEAN MUSEUM, the earliest public museum in England, built in 1682 to receive the antiquities, &c. of Elias Ashmole (q.v.). The original collections have since 1860 been dispersed; the books and MSS. going to the Bodleian, the natural history specimens to the Museum, the anthropological (including curiosities brought home by Captain Cook) to the Pitt-Rivers collection. The museum now contains British antiquities, antiquities from Cyprus, Egypt, &c.

BALLIOL COLLEGE, founded about 1268 by Devorguilla Balliol, mother of John Balliol, king of Scotland. The buildings are chiefly modern, the hall (1877) being a favourable example of recent Oxford building. This hall contains portraits of John Wyclif the Reformer, formerly master of the college; of Archbishop Tait; of Robert Browning, honorary fellow; and of Benjamin Jowett, master. By means of the Snell and Warner exhibitions, Balliol has had since the 17th century a close connection with Scotland, including among its members Adam Smith, John Gibson Lockhart, Sir William Hamilton. Colet, Parsons the Jesuit, John Evelyn, Robert Southey, Dean Stanley, Matthew Arnold, A. C. Swinburne, and Cardinal Manning were members of the college.

BODLEIAN LIBRARY (q.v.), founded in 1602 by Sir Thomas Bodley, in a room (built about 1460) over the Divinity School for the old library of the university, augmented by Humphrey, Duke of Gloucester. Duke Humphrey's Library had been plundered by King Edward VI.'s commissioners. The library has grown to be one of the great libraries of the world; it contains more than 30,000 MSS. and 500,000 books, and now occupies the whole of the Old Schools (built 1618) of the university. The library contains a fine portrait of the founder. The picture-gallery attached is one of the finest extant examples of an 'ambulacrum,' or room for walking in, found in old great houses. On its walls hang portraits of many benefactors and famous members of the university; also many historical portraits—e.g. Lord Burleigh, Mary Queen of Scots, Prince Henry (son of James I.), James Edward the Old Pretender, &c.

BRASENOSE COLLEGE, founded in 1509 by William Smyth, Bishop of Lincoln, and Sir Richard Sutton. The gateway tower (1512) is the most striking feature of the old building. The old 'brazen nose' knocker of Brasenose Hall, on the site of which the college was built, was (it is claimed) acquired in 1890, and is now found in the hall. John Foxe, Robert Burton, Dean Milman, Barham, and F. W. Robertson were students.

CHRIST CHURCH is both the cathedral of the diocese of Oxford and a college of the university. The cathedral was instituted in 1546 by King Henry VIII. in the church of the old priory of St Frideswide (q.v.). This church contains many remains of Norman architecture (1120-80), and (it is claimed) some fragments of the older Saxon church. The college was founded by Cardinal Wolsey in 1525 as 'Cardinal College,' the priory of St Frideswide being suppressed by him; was remodelled by the king as 'King Henry VIII.'s College,' in 1532; and finally settled, as 'Christ Church,' in 1546. The hall and the kitchen (1529) are Wolsey's work, and surpass any building of the kind in Oxford, or even in England. The great quadrangle ('Tom' Quad.) begun by Wolsey was not completed till 1668. Peckwater Quadrangle was rebuilt in 1705-61. The entrance tower (finished 1682) now contains 'Great Tom,' one of the largest bells in England, being the great bell of Osney Abbey recast (see BELL, Vol. II. p. 55). The 'Broad Walk' of elms leading from the Meadow Gate to the Cherwell, planted by Dean Fell (q.v.) in 1670, was long one of the finest avenues in England; but its glories have been lessened of late years by storms, the elm being unable to outlast two centuries. The library contains a valuable collection of paintings, especially by great Italian masters, with a few of the Dutch masters. The hall contains many portraits of eminent statesmen and divines by great painters, from Holbein to Millais. Sir Philip Sidney, Camden, George Peele the dramatist, John Locke, Sir George Cornwall Lewis, Dr Liddon, Gladstone, and John Ruskin are a few of the famous names of Christ Church men.

CORPUS CHRISTI COLLEGE, founded in 1516 by Richard Fox, Bishop of Winchester, in the interests of Renaissance learning. Cardinal Pole was a student here, Richard Hooker a fellow, John Keble a scholar.

DIVINITY SCHOOL, built 1445-80, a splendid example of Perpendicular architecture. The university was too poor to finish it, portions of the work showing that the carving of the interior was designed to be much more elaborate than it is. The rich colours of the roof and the stained windows were destroyed in Edward VI.'s reign.

EXETER COLLEGE, founded in 1314 by Walter de Stapledon, Bishop of Exeter. The buildings of the college have been much extended in the present century, and are nearly all modern. The chapel (1853) is a fine example of Sir Gilbert Scott's work, and contains good specimens of modern painted glass and tapestry. Members have been Grocyn, Glanville; Bishops Bull, Prideaux, and Secker; Lyell, Maurice, and Froude.

HERTFORD COLLEGE, founded in 1874 by T. C. Baring, M.P., in the interests of the Church of England. This college was erected out of Magdalen Hall (founded 1487), which had been removed to this site in 1822 from its former site near Magdalen College. The site had previously been occupied by Hart Hall, founded about 1284, which had been erected by Dr Richard Newton into Hertford College in 1740, but dissolved in 1818 for lack of funds. The 'learned' John Selden was a member of Hart Hall; so also was Charles James Fox. William Tyndall and Clarendon were members of Magdalen Hall.

JESUS COLLEGE, founded in 1571 by Queen Elizabeth at the instance of Dr Hugh Price, and its revenues greatly augmented by Sir Leoline Jenkins, principal of the college (1661). Until the Commission of 1855 the college had an exclusively Welsh connection; this has been further broken by the Commission of 1877, but there are still several scholarships and exhibitions confined to persons of Welsh birth and education. The college contains good portraits of Queen Elizabeth, the nominal foundress, and of Charles I., a benefactor. The library possesses many valuable Welsh MSS.

KEBLE COLLEGE, founded in 1870 by subscription, in memory of John Keble and in the interests of the Anglican Church. The ornate chapel is the chief object of interest. The hall contains a portrait of Keble. In the library is Holman Hunt's picture, 'The Light of the World.' The college has a different constitution from other colleges, having no fellows and being governed from without by a council.

LINCOLN COLLEGE, founded in 1429 by Richard Fleming, Bishop of Lincoln, and refounded in 1474 by Thomas Rotherham, Archbishop of York, to check the progress of Lollardism. The chapel (1631) is a good specimen of Stuart work, containing fine cedar panelling and painted glass. Among its fellows have been Robert Sanderson, George Hicke, John Kettlewell (the non-juror), John Wesley, John Radcliffe.

MAGDALEN COLLEGE, founded in 1458 by William Waynflete, Bishop of Winchester. This college, in its original quadrangle, cloisters, hall, and chapel, built 1474-81 in the founder's lifetime, possesses the finest buildings of any college in the world. The tower, built 1492-1506, on whose top the choir sing a Latin hymn on May Day, is ascribed traditionally to the initiative of Cardinal Wolsey when bursar here. The buildings in the Grove or Park, built 1736, were at one time regarded in Oxford as the perfection of architecture. A new quadrangle to the west (called St Swithin's Buildings) was added in 1885. The musical services in chapel have for centuries been famous. Among the members of this college have been Colet, Latimer, John Hampden, Joseph Addison, Edmund Gibbon. The college has a fine walk round an island formed by two branches of the Cherwell, the northern side of which is called 'Addison's Walk.' The heroic age of the college was the period 1685-88, when its resistance to the arbitrary measures of James II. gave it a foremost place in the history of England.

MAGDALEN HALL, see Hertford College.

MANCHESTER NEW COLLEGE, a college for the study of theology independent of creed, has been removed from London to Oxford. Buildings for it were erected in 1891 in Holywell, the north-eastern suburb of Oxford.

MANSFIELD COLLEGE, the chief theological college of English Nonconformity, was transferred to Oxford in 1886. Large buildings for it have been erected on a site at the back of Wadham College.

MERTON COLLEGE, founded in 1264 at Malden in Surrey, and transferred to Oxford in 1274 by Walter de Merton, Bishop of Rochester, was the first institution in Oxford organised as a college; and is therefore the type which has been imitated by all existing foundations in Oxford or Cambridge. The old quadrangle ('Mob Quadrangle,' 1278) and the library (1376) of this college are the most primitive college buildings in Oxford. The chapel (1424) is a fine building, with some good early brasses. Members of Merton College have been remarkable benefactors to the university; Sir Thomas Bodley, who founded the university library, and Sir Henry Saville, who founded professorships in geometry and astronomy, were both fellows. Duns Scotus is said to have been fellow here; William Harvey, discoverer of the circulation of the blood, was warden; and other members were Bishops Hooper, Jewel, and Pattenon; Anthony Wood, the great Oxford antiquary (buried in the ante-chapel, 1695); and Steele.

MUSEUM, the 'New Museum,' was built in 1857 to 1860, for the reception of the university medical and natural science collections, and the medical and scientific library of the Radcliffe trustees, and the accommodation of the university teachers in science. Large additions have since been made, particularly in the departments of chemistry, electricity, anatomy, and physiology. A new wing was added in 1887 to receive the remarkable anthropological collection of General Pitt-Rivers.

NEW COLLEGE, founded in 1379 by William of Wykeham, Bishop of Winchester. Walter de Merton's college had so far been the only well-established society in Oxford, and was therefore known as 'the college' *par excellence*. Wykeham's college was therefore known as 'the new college,' a name which it has retained to the exclusion of the name the founder gave it, 'St Mary of Winton College.' Wykeham founded also Winchester College to be a school to supply his Oxford college. The hall, chapel, cloisters, bell-tower, and other buildings were on a scale hitherto unknown in Oxford, and, except at Magdalen and Christ Church, have had no rivals. The gardens are very beautiful, and are bounded by the only perfect segment of the city wall. The best-known names of members of this college are Archbishop Warham; William Waynflete, founder of Magdalen College; Henry Chichele, founder of All Souls; Bishop Ken; Sydney Smith; and Augustus Hare.

NEW INN HALL, founded about 1369, was closed in 1887. During the Civil War, when Charles I. held Oxford, in 1642, the royal mint was set up here, and the old plate of the colleges was coined for the king's use.

ORIEL COLLEGE, founded in 1326, nominally by King Edward II., but really by Adam de Brome, his almoner, in a house on the High Street, removed in 1329 to 'la Oriole,' a house on the present site, whence it has its modern name. For a long time it was known as 'King's College' (Collegium Regale). The buildings are modern, the hall and chapel dating from 1637. William Langland, author of *Piers Plowman*, was, but erroneously, at one time believed to have been fellow here. Sir Walter Raleigh was probably commoner for a short time. In the first half of the 19th century Oriel College possessed a most distinguished body of fellows—Keble, Pusey, Thomas Arnold, Archbishop Whately, Cardinal Newman, Arthur Hugh Clough.

PEMBROKE COLLEGE, erected in 1624 by Thomas Tesdale and Richard Wightwick, out of Broadgates Hall, a most ancient place of academical study, in which Bishop Bonner, Beaumont the dramatist, and Sir Thomas Browne had been students. The name was given in compliment to the Earl of Pembroke, then chancellor of the university, and in hope of a godfather's gift from him, which his death soon after prevented. Members of this college (and hall) have filled the three Anglican primatial sees of Canterbury (Moore, 1783), York (Yong, 1561), Armagh (Newcome, 1795). Dr Johnson was a student here.

QUEEN'S COLLEGE, founded in 1340 by Robert de Eglesfeld, chaplain to Philippa, queen of Edward III. He arranged that the queen-consort of England for the time being should be patroness of the college; hence its name, and several donations by queens of England when the college was in difficulties. The college was rebuilt in 1707-14. Henry V. is said to have been a student here for a short time; and other members were Cardinal Beaufort, Wyherley, Addison, and Collins. The college retains the old ceremony of bringing in the 'Boar's Head,' with the traditional song, on Christmas Day.

ST ALBAN HALL, founded about 1230, was united to Merton College in 1882.

ST EDMUND HALL, founded about 1260. Queen's College appoints the principal. Thomas Hearne, the antiquary, was long resident here.

ST JOHN'S COLLEGE, founded in 1555 by Sir Thomas White. The chapel, hall, entrance tower, and part of the street front of the outer quadrangle are substantially those of St Bernard's College, a house of the Cistercian monks, built here 1437-1530. The garden front of the inner quadrangle was built by Archbishop Laud (q.v.) in 1631. Members of this college have deserved well of the university, Archbishop Laud and Dr Richard Rawlinson having been principal benefactors to the Bodleian. Edmund Campion, Shirley the dramatist, Edmund Calamy, and Dean Mansell are other St John's names.

ST MARY HALL, founded in 1333 by Oriel College. The hall long retained a close connection with Oriel, and a fellow or ex-fellow of Oriel has generally been principal. The statutes of 1877 contemplate the ultimate incorporation of the hall into the college.

SHELDONIAN THEATRE, built in 1669 by Archbishop Sheldon for the holding in it of the great university degree ceremonies. These had hitherto been held in St Mary's Church, but the riotous conduct of the spectators (in 1652 the undergraduates had to be kept in order by soldiers of the garrison) often scandalised those who had regard to the sacred character of the building. The 'act' (the degree-ceremony in which all M.A. degrees and doctors' degrees granted during the year were supposed to be completed by 'inception') is now superseded by the *Encenia*, in which prize compositions are recited (among them the 'Newdigate', q.v.), honorary degrees are conferred, and a Latin oration delivered.

TRINITY COLLEGE, founded in 1554 by Sir Thomas Pope. The library is part of Durham College which stood here (see DURHAM); the hall dates from 1620; the chapel, with its fine carved cedar, from 1694; the garden quadrangle was built 1665-1728; and large new buildings were added in 1887. The 'Lime Walk', planted in 1713, is the feature of the garden. Kettell Hall, on Broad Street, near the college, built in 1615 by Ralph Kettell (president of Trinity), is a characteristic example of Oxford architecture of the period. Chillingworth, Selden, Denham, Aubrey, Thomas Warton, Landor, Newman, and Freeman were members.

UNIVERSITY COLLEGE had its origin in an endowment left in 1249 by William of Durham for the maintenance of some graduates of the university. This was at first administered by the university itself, and the institution called the university's Great Hall, 'Magna Aula Universitatis,' in distinction probably from some smaller 'halls' which the university owned. Afterwards the administration of the trust was committed to the beneficiaries themselves; and, under the influence of the example of Walter de Merton's foundation, the society became a college. In the 14th century there grew up a legend that the building occupied the site of a college founded by King Alfred, destroyed in the Danish invasion. By a later effort of imagination King Alfred was said to have founded University College in 872 A.D. University College was a great power in Oxford in 1686-88, when its master, Obadiah Walker, was the chief agent in the Roman Catholic effort to reconquer Oxford. The lawyers Lord Eldon and Lord Stowell, Sir William Jones, and the poet Shelley were members of this college.

WADHAM COLLEGE, founded by Dorothy, widow of Sir Nicholas Wadham, in 1613, on the site of the old Austin Friary. The beautiful gardens of this college perhaps owe something to the labours of the friars. The college buildings are an exquisite specimen of Jacobean work; the street front in particular is one of the prettiest bits in Oxford. Admiral Blake was a student here, and his portrait is in the hall. The Royal Society took its origin in meetings in the rooms of Dr John Wilkins, warden of Wadham.

WORCESTER COLLEGE, founded by Sir Thomas Cookes of Worcestershire in 1714, in Gloucester Hall. Gloucester Hall had in 1560 succeeded Gloucester College, a college for Benedictine monks, founded in 1283, dissolved at the Reformation. Each monastery had its own building; and a row of these, forming one side of Worcester College quadrangle, each with the coat of arms of its monastery carved in stone over the door, is one of the most interesting bits of old Oxford. During the earlier part of Eliza-

beth's reign Gloucester Hall was filled with Roman Catholic students, their tutors being graduates who had been ejected from their fellowships in various colleges for refusing the oath of allegiance. In the 17th century there was for some time a project to found here a college for the education of clergy of the orthodox Greek Church. Lovelace, Sir Kenelm Digby, and De Quincey were members.

The university of Oxford is a corporation under the title of 'the chancellor, masters, and scholars of the university of Oxford.' It consists of a body of graduates (masters of arts and graduates in law, medicine, and divinity) who are the governing members of the corporation, and of a body of undergraduates (and bachelors of arts) who are 'in statu pupillari,' that is, subject to the government of the officers of the university and without voice in university business. The statutes by which the university is governed are partly the code promulgated in the chancellorship of Archbishop Laud, partly the body of enactments issued by a parliamentary commission in 1877. The business of the university is formally transacted in three houses: (1) the Ancient House of Congregation, consisting of masters of arts of less than two years' standing, heads of colleges, deans of degrees of colleges, professors, examiners, &c., in which the ceremonial business of conferring ordinary degrees is conducted; (2) the House of Congregation, constituted by act of parliament in 1853, consisting of university officers, professors, and resident graduates (in 1891 there were 391 graduates resident), in which proposed statutes are submitted for discussion and vote; (3) the House of Convocation, consisting of all graduates who have kept their names on the books (5966 in 1891), which is in theory the supreme governing body of the university. Thus, all statutes and decrees of the university are voted upon in convocation, and it is convocation which elects the two members whom the university returns to parliament. Practically, however, the business of the university is in the hands of the Hebdomadal Council and of small committees, called delegacies (or curators). Council began as a committee of heads of houses, invented under Stuart absolutism to control the free spirit of the university. It now consists of the vice-chancellor and proctors, and eighteen persons elected by convocation, six being heads of houses, six professors, and six graduates. Council retains the initiative in all legislation, the control of most of the negotiations in which the university takes part, the nomination of persons to receive honorary degrees, and the like. Committees govern the institutions of the university, such as the Bodleian Library, the University Chest, the University Press, and the Museum. The chief officers of the university are (1) the chancellor, the official head of the university, generally a peer of the realm, elected for life by convocation; (2) the vice-chancellor, nominated by the chancellor from the heads of houses in rotation, and holding office (as a rule) for four years; (3) the two proctors, holding office for a year, elected by the graduates of the colleges according to a cycle, each college getting its turn to elect a proctor every eleventh year. The proctors are specially charged with the discipline of the university as regards its junior members. Each college of the university is a distinct corporation, self-governed according to its own statutes under sanction of the parliamentary commissions of 1852 and 1877.

The earliest historical notice of Oxford shows also its importance in early times. In 912 A.D. the Saxon Chronicle records that, on the death of Ethelred, Edward (the son of Alfred) took possession 'of London and Oxford and all the lands obedient to those cities.' The remarkable Castle mound,

now shamefully included in the precincts of the county gaol, was heaped up at this period, being part of the great system of fortifications which were then raised against the Danes. During the troubled years which follow Oxford is frequently mentioned, its position just between Mercia and Wessex rendering it important as a citadel against invasion, and as a place of parley between Danes and Saxons. It may be inferred that at the Norman Conquest Oxford offered a stubborn resistance to the invader (1) from the great number of 'waste' houses mentioned in the Domesday survey; (2) from the vastness of the work erected by the conqueror's governor, Robert Doyley, to overawe the city and district. Two portions of this work remain, the tower (now of St Michael's Church) which commanded the approach to the assailable North Gate of the city, and the great keep of the Castle (now in the precincts of the gaol). In the contest for the crown between the Empress Maud and Stephen (1142) Oxford was again a place of capital importance, Maud taking refuge in Oxford when driven from London, and escaping over the frozen Thames when the castle was about to surrender to Stephen after ten weeks' siege. Here in 1258 the 'mad parliament' enforced on Henry III. the scheme of reform known as the Provisions of Oxford (see MONTFORT). From this date Oxford as a town ceases to be of national importance, except for a few years in the heat of the great Civil War, when Charles I. made it the centre of his operations, the station of his court, and the meeting-place of the 'parliament' which he had brought together in opposition to that 'Long' one at Westminster.

But at the very time when Oxford, as a city, was losing its political and strategical importance there was growing up within it a distinct, and destined often to be a hostile, corporation which was to make it for centuries the intellectual capital of England. The word 'university' implies now a corporate body of teachers and students, established for the pursuit of the higher branches of learning, endowed with privileges and protected by charters granted by sovereign powers; and we find by the end of the 12th century and the beginning of the 13th a corporation of this kind established in Oxford. But this corporation must have been only the official recognition of a guild of teachers with their pupils which was already in existence in the city; and a guild of this kind must, in its turn, have been the development of accidental, and perhaps temporary, assemblages of teachers and students. The beginning of the university of Oxford is therefore to be carried as far back as the earlier third of the 12th century; Thibaut d'Estampes (Theobaldus Stampensis) about 1120, and Robert Pullein in 1133, being recorded to have taught in Oxford. The university, thus begun under Henry I. (who in 1130 built as a royal residence Beaumont Palace in the north suburb of Oxford, in which palace Richard Cœur de Lion was born in 1157), rapidly grew in numbers and in prestige; and by the beginning of the 13th century we find popes and kings interested in its fortunes, its scholars numbered perhaps by thousands and not by hundreds, and the feuds between it and the town occasionally events of almost national importance. Teachers and scholars in this early university were of the secular clergy; they lived and taught in houses ('halls') and lecture-rooms ('schools') hired from the townsmen; and discipline was practically non-existent.

The fame of the university attracted to Oxford the four great orders of mendicant friars immediately after their arrival in England, the Dominican (Black) Friars coming in 1221, the Franciscan (Grey) Friars in 1224, the Carmelite (White) Friars

in 1253, and the Austin Friars in 1268. The friars, unlike the older orders of monks, who had stood aloof from secular learning, threw themselves with enthusiasm into the studies of the university; and the 'schools' in their convents and their lecturers soon eclipsed the fame of the secular schools and teachers. That Oxford can boast the greatest names in mediæval learning and legend, Roger Bacon and Friar Bungay, is due to these conventual schools. So threatening did the supremacy of the friars become that the university in the early 14th century had a hard fight with them to retain the control of its own education (see the Rev. H. Rashdall's paper on 'The Friars Preachers *versus* the University' in the Oxford Historical Society's *Collectanea*, vol. ii. 1890).

The intellectual triumphs of the friars kindled the spark of emulation in the older monastic orders, and they in their turn began to found conventual schools at Oxford for students of their own body. The Benedictines had four colleges in Oxford: Gloucester College, founded in 1283, part of whose buildings are now in Worcester College; Durham College, perhaps begun in 1290, partly now in Trinity College; Canterbury College, founded in 1363, now taken into the site of Christ Church; and St Mary's College, founded in 1436, now a dwelling-house belonging to Braenose. For the Cistercians St Bernard's College was founded in 1437, and parts of this building are still found in St John's College.

The introduction into the university of the conventual system, with the severity of its discipline, the interpenetrating stimulus of its common life, and the efficiency of its personal tuition, suggested a change in the university of secular students which was to effect in time an entire revolution in its form. In 1264 Walter de Merton conceived the plan of bringing together into a common home a number of secular students, engaged in academic studies but subject to something like conventual discipline. In 1274 he moved his college (which he had established at Malden in Surrey) to Oxford. Two other institutions, which had been founded in Oxford at a slightly earlier date, soon, under the influence of the new idea, took the shape of Balliol and University Colleges. By 1525 ten other colleges had been instituted, among them such great designs as New College, Magdalen College, and Wolsey's Cardinal College (afterwards reconstituted by Henry VIII. as Christ Church, with a fraction of its former endowment).

The Reformation of religion, and the dissolution of the monasteries which it carried with it, destroyed half the glory of Oxford. Two abbeys, five friaries, and five monastic colleges ceased to exist; and the western and south-western quarters, which had contained the finest buildings of the city, became heaps of stones out of which the citizens of Oxford quarried building material. During the Romanist reaction under Queen Mary something was done to repair the loss thus inflicted: Trinity College in 1554 and St John's in 1555 restoring to Oxford Durham College and St Bernard's College. Jesus College, founded nearly twenty years later, in Elizabeth's reign, was the first of Protestant colleges. The more settled times of the early Stuarts patronised the gown more liberally; Wadham College coming in 1613, Pembroke in 1624. Then came the great catastrophe of the Civil War, and learning and the encouragement of learning ceased. The years passed to 1714 before a new foundation arose in Oxford, in Sir Thomas Cooke's Worcester College; and, except for the abortive attempt (1740-1818) to erect Hart Hall into a college, that example found no imitator till our own times, when the foundations of Keble College in 1870 and of Hertford College in 1874, followed

by the transference to Oxford of Mansfield College and of Manchester New College (though these two colleges are not incorporated in the university), bear witness to the new life which has begun to throb alike in the Anglican Church and in Non-conformity.

In Elizabeth's reign, and still more under the Stuarts, we have to mark a very strong desire on the part of the supreme power to compel all students in the university to reside within the walls of the colleges and the halls (then five in number, now reduced to two). The strong opposition of minorities, in matters both of polity and faith, rendered English sovereigns and their ministers suspicious and intolerant of students and teachers who were not directly under their control; and to secure this control they required that all students should reside in the colleges, where they were under the charge of governors appointed by court influence and responsible to the court. From this time, therefore, we have to date the disappearance of the old university and the development of that peculiarly English form, a university of colleges.

In the following six features the university of Oxford stands in marked contrast to universities out of England. (1) The College System. Before a person becomes a member of the university he must first of all become a member of one of the twenty-one colleges or two halls; and the moment he ceases to be a member of one of these societies his actual membership of the university is also terminated. This means that the Oxford undergraduate is not left as a unit in a great body of two or three thousand, but is made a member of a much smaller body of perhaps eighty to two hundred members, and is therefore subject to closer personal scrutiny and to stronger influences of social opinion than would be possible in universities differently constituted. It is true that the influence of this common life is partially discounted in the case of students from the public schools, where similar influences have already formed their character; but in the case of students from small schools or solitary homes the vigorous social life of a good college is wonderfully efficacious in converting the raw, diffident, or morose boy into the frank, self-reliant, and sociable man. (2) The Fellowship System. Formerly every first-class man (and many in the second class) could count with certainty on his fellowship—that is, on a secure endowment (for a shorter or longer period) which would enable him to pursue his studies or to prepare himself for professional life. Some few of these fellowships are still open to competition; but the regulations of the Commission of 1877, which suppressed many fellowships to found professorships, coinciding with the loss of more than a third of the annual revenues of the colleges from the fall in agricultural rents, have seriously reduced their number and, so far, deprived Oxford of her best feature. The scholarship system—i.e. endowments held during the time of an undergraduate's course, is not so distinctive of Oxford; though such endowments are more numerous and valuable in Oxford than in any other university. (3) The System of Tuition. In foreign universities the work of tuition is undertaken by university teachers—i.e. by the professors. In Oxford the professoriate has withdrawn itself from any real share in this work, and, so far as concerns the mass of Oxford students, might be entirely suppressed without in any way affecting their studies. In all ordinary subjects, speaking generally, the professors have long ceased to give systematic instruction, and have at most expounded some small, and to the ordinary student often unnecessary, point in their subject. It is plain that from two lectures a week,

delivered through at most three terms of seven weeks each, a student can learn little in language, in history, in philosophy, or in science. The work of tuition which in other universities is discharged by the professors is in Oxford discharged by the college lecturers. Formerly a college lecturer lectured only to the men of his own college, a system which was terribly unfair to the students of an inefficient college; of late years the better college lectures have become practically open to the whole university, and, especially in lectures connected with the honour schools, frequently without fee. The college lecturers of Oxford are therefore the professors of Oxford, except that they are not called by that name, and that they are paid by their college, not by the university. At the same time, the old Oxford tradition of a college tutor devoting himself to the interests of the men of his own college still continues. Apart from attendance at lectures, a large portion of Oxford tuition consists in taking compositions, translations, papers, and essays either individually or in very small classes to one's tutor or lecturer. This individual instruction involves, it is true, an expenditure of time and talent which seems out of all proportion to the results it achieves, yet the happiest memories of Oxford men are probably those half-hours or hours in their tutor's room when their individual faults were exposed by the large scholarship and their individual eccentricities corrected by the unsparing but good-natured chaff of a kindly mentor. One result of the remarkable improvement in college tuition of the last few years has been the almost total disappearance of the 'private coach' from the honour work of the university. Private coaching continues to a great extent in the pass schools, partly because some candidates have been very badly taught at school and are below the level of their fellows, but chiefly because candidates are too idle to read by themselves. Quite a recent development of the professoriate deserves notice here. When the university has resident in it a man of special reputation in a given branch of study, the common university fund has of late years appointed him to lecture for three or five years in his own subject. In some cases undergraduate Oxford has not seconded this by attendance at these lectures, but the approval of maturer scholars has followed this public recognition of learning. Such lecturers are known by the new title of 'Readers.' (4) The Discipline. The discipline of Oxford is much stricter than that of any university outside England. Within college the government of the college deans, without college the vigilance of the proctors and their deputies, repress disorder and immorality. Sad as is the waste of young lives in Oxford, no one who has known a laxer discipline can refuse to recognise that if a man goes to the bad in Oxford he does it of his own wilful and obstinate choice. (5) At the same time, Oxford must be marked for the excessive luxury and idleness of its students. The common life of the colleges has this disadvantage, that it requires considerable force of character for a poor student to live in proportion to his poverty; there being every inducement for a man of weak character to live after the fashion of his richer and more careless contemporaries. Hence the son of a man of £400 a year often spends during his course at the rate of the son of £4000 a year, and begins his after-life under a heavy burden of debt. And lastly, amusements of different kinds, football, rowing, cricket, tennis, billiards, cardplaying, debating, the theatre, to say nothing of the baser kinds, such as betting, wines, worrying rats and rabbits, are thought of, talked of, and pursued by many undergraduates till barely an hour a day in the eight weeks of term is left for any serious or

intellectual pursuit. For this devotion to amusements the public schools are largely responsible. (6) The Oxford course is entirely out of touch with the professional education of the country. The Oxford undergraduate, entering the university at nineteen or twenty, finds himself at twenty-three or twenty-four, after the expenditure of £800 or £1000, and the formation of idle habits and expensive tastes, with his whole life to begin afresh. If he wishes to enter the church he has generally to spend some years in a theological college; if he desires to go to the bar he must proceed to the Inns of Court; if he intends to practice medicine the long and expensive training of the London hospital schools has to be gone through.

Scholars and exhibitioners are admitted to a college without special matriculation examination; intending commoners are examined in some form or another by the college tutors. In some colleges it is enough to have passed Responsions, or equivalent examination; in others a further test is imposed; and some few colleges accept candidates in the hope that they will in the course of a term or two pass Responsions. But the practice of colleges varies so much from year to year that personal inquiry about the exact nature of the entrance examination is always advisable and generally necessary.

After admission there opens up a perplexing variety of courses which lead to the degree; but the general rule will be found to hold good, 'avoid any new-fangled course introduced by council, and proceed along the old beaten paths.' Under present arrangements the degree is reached by three examinations: (1) Responsions, familiarly termed 'Smalls.' This is a preliminary examination in the elements of Latin, Greek, and mathematics. It can be passed before coming into residence by means of various school examinations or by presenting one's self as a candidate for matriculation from a college. It *ought* always to be passed before matriculation, except in those cases where the instruction available is so bad that a pass is hopeless under it. (2) After Responsions the candidate has before him the examination which the statutes call the 'First Public Examination,' but men call Moderations ('Mods'), or an equivalent examination. Here it is necessary to decide whether a candidate shall (a) take an Honours examination in the middle of his course, (b) take a Pass examination at that point, or (c) take an examination which implies taking an Honours examination at the end of the course. The decision must be made according to the candidate's attainments, guided by the shrewd advice of his college tutor. In the first case (a) there are honours to be had in classics and mathematics (or in both, if the candidate read double) in the course of the second year; in the second case (b) a further examination in classics, with the addition of the elements of logic or some further mathematics has to be passed, and this ought to be done in the fourth term of residence; in the third case (c) there is what is called a 'preliminary examination' in law or in science giving admission to the final honour schools. All candidates, whether pass or honours, have at this stage to pass an examination in a small portion of Scripture, or an alternative examination provided for those who object to this examination in religion. (3) In the final examinations, officially termed the 'Second Public Examination,' but colloquially 'Greats,' the distinction between pass and honours is very marked. For the pass degree a candidate has to obtain a pass in three schools, of which one must be a language school (classics, French, or German), and the other two may be chosen from divinity, history (ancient or modern), political economy,

law, or various branches of natural science. For the honours degree the candidate may choose one or more of the schools of—classics (officially termed 'Literæ Humaniores,' including not only the languages but the history and philosophy of Greece and Rome), mathematics, natural science, law, modern history, theology, oriental languages. Of these the most coveted distinction is the First in 'classical greats,' traditionally the chief Oxford school, for which most scholars and exhibitioners are required to read, and by examination in the subjects of which most of the few open or 'prize' fellowships are awarded.

The traditional 'double first'—i.e. a first-class in classics and mathematics, when there were no moderations and only these two final schools, such as was won by W. E. Gladstone in 1831 and by Dean Liddell in 1833—is now forgotten; and as many as three, four, or even five firsts are obtained without bringing the successful candidate much reputation in the university, or even a fellowship.

Candidates entering for an honour school and failing to get honours may be either 'ploughed'—i.e. rejected entirely—or 'gulfed'—i.e. allowed a stage in the pass degree. If a candidate in any school despairs of his chances, he can 'scratch'—i.e. remove his name from the list of candidates. In many of the schools, both pass and honours, there is a *vivâ voce* examination as well as a written examination. In the final honour schools candidates who have broken down in health may obtain an 'ægrotat' certificate allowing them to proceed to their degree. Four such certificates were allowed in 1890.

The following list, compiled from the honours lists of 1890, exhibits the distribution of candidates among the honour schools and between the four classes in each school:

GREATS.

	Class I.	Class II.	Class III.	Class IV.	Total.
Classics.....	22	48	41	13	124
Mathematics.....	9	5	6	3	23
Chemistry.....	6	7	4	..	17
Morphology.....	2	1	3
Physics.....	..	2	2
Geology.....	..	1	1

Oriental.....	..	3	3

MODERATIONS.

Classics.....	50	93	82	..	225
Mathematics.....	7	12	7	..	26

A comparison of the above table with the list of professors, lecturers, and demonstrators yields the ridiculous result that to produce twenty-six candidates graduating in honours in science the university employs a staff of twenty-seven teachers, and that these require the assistance of several college lecturers.

The number of persons who graduated B.A. in the academical year 1889-90 was 597. The degree of M.A. is obtained by keeping the name on the books for three (or four) years from the date of B.A., by paying quarterly dues, and by paying graduation fees. The number of M.A.'s taken in 1889-90 was 421. The university of Oxford grants also the degrees of bachelor and doctor in divinity, law, medicine, and music. The exercises for degrees in divinity are merely formal, but the fees paid for these degrees are considerable. The bachelors' degrees in law, medicine, and music are awarded after examinations which have been brought up to the standard of those professions, but for the most part candidates study for them outside the university. The doctors' degrees in the same faculties are now awarded, as in other

universities, on the production of approved theses. In the academical year 1889-90 the following persons graduated: In divinity, B.D. 13, D.D. 7; in law, B.C.L. 11, D.C.L. 2; in medicine, M.B. 9, M.D. 1; in music, B. Mus. 7, D. Mus. 1.

The university, on the initiative of the Hebdomadal Council, from time to time confers *honoris causa* the degrees of M.A., D.C.L., and D.D., the latter by custom being always voted to members of the university who have been raised to the episcopal bench. The number of these 'honorary degrees' in the academical year 1889-90 was as follows: Hon. M.A. 1; Hon. D.C.L. 7; Hon. D.D. 5.

All ordinary degrees require that candidates should have kept a specified number of terms by having their names on the books of some college or hall or of the non-collegiate students. For the degree of B.A. it is further required that the candidate should have resided in Oxford during twelve terms. In the academical year there are four terms—Michaelmas term (October to December), Hilary or Lent term (January to March), Easter and Trinity terms (the latter beginning the day after the former closes, April to July). The first two are kept by six weeks' residence, the last two by three weeks' residence in each, the legal requirements of residence being thus eighteen weeks in the year. The colleges, however, under ordinary circumstances, require an undergraduate to reside eight full weeks in each term (counting Easter and Trinity as one term)—i.e. twenty-four weeks in the year.

The number of undergraduates is now much too large to be accommodated within the walls of the colleges, and most colleges have undergraduates

residing outside the college in lodgings in the town. They are still, however, strictly under the control of the university and the college. (1) No undergraduate is allowed to lodge in a house nor with a landlord who has not been licensed by the university, a provision which partially guards against unsanitary lodgings and overt scandalous conduct, but immensely increases the expense of lodgings; (2) if the undergraduate goes out or comes in after 10 p.m. the fact is supposed to be noted in the 'gate bill' which the landlord has to send weekly to the college. In October 1890 there were residing in lodgings 637 undergraduate members of the colleges and halls and 211 non-collegiate students.

Since 1868 there has been in Oxford a body of students not members of any college or hall, styled formerly 'unattached students,' but latterly 'non-collegiate students.' These reside in licensed lodgings; have a building provided by the university in which they attend lectures and meet their tutors; are under the disciplinary control of a censor, as the students of a college are under the control of their dean; and are supervised by a board of delegates, in the same way as the students of a college are by the head and fellows of their college. Under a statute of 1882 it is possible for a member of convocation to open a 'private hall,' of which he is the 'licensed master,' for the reception of academical students. These private halls act chiefly as a limbo to which, in preference to leaving the university altogether, students who have been rejected by or ejected from the colleges betake themselves.

The number and disposition of the fellows and undergraduate members of the university in 1891 are shown in the following table:

Foundation.	Date of	Title of Head.	No. of	No. of	No. of	No. of
			Fellows.	Scholars.	Exhibitioners, &c.	Commoners.
University College (Univ.)	1249	Master.	13	17	14	70
St Edmund Hall	1280	Principal.	35
Balliol College	1288	Master.	13	27	32	130

Charley's (Private) Hall	..	Licensed Master.	31
Turrell's (Private) Hall	..	Licensed Master.	8
			309	494	293	2144

In this table it must be noted that in the column of commoners none are reckoned who matriculated before 1886, and that to ascertain the number of commoners in actual residence about five per cent. must be struck off the numbers given. At Merton College the scholars are called 'postmasters,' at Magdalen College, 'demies.' At Christ Church the fellows are called 'students,' and until 1877 the scholars were called 'junior students.' Christ Church, being a cathedral as well as a college, has also an ecclesiastical foundation of six canons.

Oxford is fortunate in having been described from the points of view of its different interests in several attractive handbooks: Rev. C. W. Boase's *Oxford City*, in the 'Historic Towns' series (Longmans, 1887); Dr Brodriek's *History of the University of Oxford*, in the 'Epochs of Church History' series (Longmans, 1886); Rev. E. Marshall's *Oxford Diocese*, in the 'Diocesan His-

tories' series (S.P.C.K. 1882); and *The Colleges of Oxford: their History and Traditions*, edited by A. Clark (Methuen, 1891). Messrs Parker's *Handbook for Oxford* is an admirable guide to the architectural features of the city; and in Andrew Lang's *Oxford: Brief Historical and Descriptive Notes* (1885; new ed. 1890) a charming presentment of Oxford is given both by writer and artists. A manual of the studies of the university is furnished by J. Wells in his *Oxford and Oxford Life* (Methuen). A full account of Oxford, civic, ecclesiastical, academic, collegiate, personal, up to the end of 17th century, will be found in the various works of the great Oxford antiquary, Anthony Wood, in the following editions—his *History of the University and of the Colleges and Halls*, by J. Gutch (1786-96); his *Athenæ and Fasti*, by Dr Bliss (1813-20; a new edition of these is in preparation); his *City of Oxford*, by A. Clark (1889 *seqq.*). From the time of Wood the formal annals of the university become of little interest and very little importance. The interest of books about Oxford rather lies in the diaries which

give the day-to-day impressions of Oxford residents, Anthony Wood for the 17th century and Thomas Hearne for the 18th (best edition of both by the Oxford Historical Society), or in reminiscences of Oxford life in memoirs and autobiographies—e.g. in the autobiographies of Edmund Gibbon, R. L. Edgeworth, &c., and in Stanley's *Life of Arnold*. Part of the ground traversed by Wood has been gone over from the point of view of modern criticism by James Parker for the city (to the year 1100) in his *Early History of Oxford* (Oxf. Hist. Soc. 1888), and by H. C. Maxwell Lyte for the university (to the year 1530) in his *History of the University of Oxford* (Macmillan, 1886).

Periodical publications are—for the city, Valter's *Oxford Post-office Directory* and Alden's *Oxford Almanac*; for the university, *Oxford University Calendar*, *Student's Guide to the University*, *Regulations of the Boards of Studies*, and (weekly during term) *University Gazette*; for the diocese, Parker's *Oxford Diocesan Calendar* and (monthly) Parker's *Oxford Diocesan Gazette*. The local press is exceptionally vigorous, the weekly penny papers being *Oxford Chronicle* (Liberal), *Oxford Times* (Conservative), *Jackson's Oxford Journal* (established 1753), *Oxford Guardian*. The *Oxford University Herald* is a weekly paper (2d.); the *Oxford Review*, daily during term, a halfpenny evening paper; and the *Oxford Magazine*, weekly during term, 6d., the most established of university journalistic ventures.

Oxford Movement. See ENGLAND (CHURCH OF), and KEBLE, NEWMAN, PUSEY.

Oxfordshire, an inland county of England, in shape very irregular, and with an extreme length and breadth of 48 miles by 26; is bounded on the N. by Warwickshire and Northants, E. by Bucks, S. by the river Thames, and W. by Gloucestershire. Area, 755 sq. m., or 483,621 acres. Pop. (1841) 163,143; (1881) 179,559; (1891) 185,938. Flat and bleak in the north and west, except near Edgehill (q.v.), on the Warwickshire border, and undulating in the central district, the county in the south presents a succession of richly wooded hills, alternating with picturesque dales, and terminating on the south-east border with a branch of the Chiltern Hills, which, near Nuffield, attain a height of nearly 700 feet above the sea-level. Foremost, however, among the natural beauties of Oxfordshire are the numerous rivers by which it is watered, notably the Thames, with its affluents the Windrush, Evenlode, Cherwell, and Thame. The Oxford and Birmingham Canal affords access to the midland coalfields. The soil in general is fertile, and the state of agriculture advanced, as evidenced by the fact that in 1889, exclusive of 2061 acres under cultivation as orchards and market-gardens, no less than 414,192 acres were under crops, fallow, or grass. Ironstone is extensively worked near Banbury, whilst of manufactures the most important are those of blankets at Witney, paper at Shiplake and Henley, and, to a certain extent, of gloves at Woodstock. The county contains fourteen hundreds, the municipal boroughs of Banbury, Chipping Norton, Henley-on-Thames, and Woodstock, and parts of those of the city and university of Oxford, and of Abingdon (the remainder being in Berkshire), and 292 civil parishes, all in the diocese of Oxford. Three members are returned to the House of Commons for the county, as also one for the city of Oxford and two for the university; the county council numbers seventy-six members. Most of the historical events connected with the county took place at Oxford (q.v.), but apart from them may be mentioned the battles of Chalgrove (1643) and Cropredy Bridge (1644). The best known of its worthies are Edward the Confessor, Leland (the antiquary), Dr Heylin, Viscount Falkland, 'Doctor' Fell, Thomas Ellwood, Lord Chief-justice Holt,

Rev. James Granger, Warren Hastings, Lord Keeper Guilford, Sir William Beechey, Miss Edgeworth, Charles Reade, Green (the historian), Lord Penzance, Sir William Vernon Harcourt, and Lord Randolph Churchill. See works by Skelton (1823) and Davenport (1869).

Oxidation is the term applied in chemistry, with a somewhat wide significance, to the changes which occur when elementary or compound substances enter into new combinations with oxygen. The majority of those chemical actions to which the term Combustion (q.v.) is applied are examples of oxidation. The products of the processes of oxidation are frequently (but not invariably) oxides.

Oxides are compounds of oxygen with other elements, and are amongst the most important of the classes of chemical compounds. Basic oxides and acid oxides are described in the article CHEMISTRY (q.v.). In addition to these two large classes of oxides there are numerous oxides which do not possess either basic or acid properties, or if at all only to a very insignificant degree.

Oxlip. See COWSLIP.

Ox-pecker. See BEEF-EATER.

Oxus, the ancient name of a river in western Asia, which is called by Arab writers Jihûn, and by the Asiatics of the regions through which it flows Amû or Amû-Daria. It rises in the elevated tablelands between the Tian-Shan Mountains and the Hindu-Kush, and flows west as far as 66° E. long. through Badakshan, and then north-west through Bokhara and Khiva, and empties itself by several mouths into the southern end of the Sea of Aral. There are two main head-streams issuing at 13,042 and 14,177 feet respectively, and uniting in 71° 20' E. long. at 7500 feet. In the first part of its course the volume of the Oxus is increased by numerous affluents, but it receives few tributaries after it turns north-west, its course then running through the deserts of Turkestan. The delta is 90 miles long, and embraces many lakes and marshes. The principal use made of the river is for irrigation purposes; Khiva owes its prosperity entirely to its waters. The river has been ascended for 280 miles by steamboats. It is believed that before the Christian era the Oxus flowed into the Caspian, and that since about 600 A.D. it has twice changed its course. The Russians have been considering the possibility of turning it back again into the Caspian. The physical conditions seem to be favourable, and if the plan were carried out Russia would get a navigable highway a couple of hundred miles farther towards the centre of Asia. For the great railway bridge across the river (1888), see BRIDGE, Vol. II. p. 444; and see works by J. Wood (1841; new ed. by Colonel Yule, 1872) and MacGahan (1876).

Oxyazo. See DYEING, Vol. IV. p. 142.

Oxychlorides, chemical compounds containing both chlorine and oxygen in combination with some other element, and intermediate in composition between the oxides on the one hand and the chlorides on the other. Thus, antimonious oxychloride, SbOCl, is intermediate between antimonious oxide, Sb₂O₃, and antimonious chloride, SbCl₃.

Oxygen (sym. O, atom. wt. 16) is a colourless, inodorous, tasteless gas, long regarded as a 'permanent' gas, but liquefied by Pictet of Geneva for the first time in 1877. Its chemical affinities for other elementary substances are very powerful; with most of them it is found in combination, or may be made to combine, in more than one proportion; with several in as many as four different proportions; and there is only one element (fluorine) with which it does not enter into any combination.

Owing to the intensity with which many of these combinations take place, this gas has the power of supporting Combustion (q.v.) in an eminent degree. It is only slightly soluble in water; 100 cubic inches of that liquid dissolving 4.11 cubic inches of gas at 32°, and only 2.99 inches at 59°. It is slightly heavier than air, its specific gravity being 1.1056.

Oxygen gas is not only respirable, but is essential to the support of animal life; and hence it was termed *vital air* by some of the older chemists. A small animal placed in a bell-glass containing pure oxygen will not be suffocated as soon as if it were placed in the same glass filled with atmospheric air. For further details on this property of oxygen, the reader is referred to the article RESPIRATION.

Oxygen is the most abundant and the most widely distributed of all the elements. In its free state (*mixed* but not *combined* with nitrogen) it constitutes about a fifth of the bulk, and considerably more than a fifth of the weight, of the atmosphere. In combination with hydrogen, it forms eight-ninths of all the water on the globe; and in combination with silicon, calcium, aluminium, &c., it enters largely into all the solid constituents of the earth's crust; silica—in its various forms of sand, common quartz, flint, &c.—chalk, limestone, marble, and all the varieties of clay, containing about half their weight of oxygen. It is, moreover, found in the tissues and fluids of all forms of animal and vegetable life, none of which can support existence independently of this element.

There are various laboratory methods of obtaining oxygen on the small scale, the simplest of which consists in the exposure of certain metallic oxides to a high temperature. It was originally obtained by its discoverer, Dr Priestley, from the red oxide of mercury, which, when heated to about 750°, resolves itself into metallic mercury and oxygen gas. It may be obtained similarly from red oxide and peroxide of lead, the resulting products being protoxide of lead and oxygen.

The ordinary laboratory method commonly employed to obtain an abundant supply of oxygen consists in heating chlorate of potash, KClO_3 , which yields up all its oxygen (amounting to 39.16 per cent.), and leaves a residue of chloride of potassium. One ounce of this salt yields nearly two gallons of oxygen gas. It is found by experiment that if the chlorate of potash is mixed with about a fourth of its weight of black oxide of copper, or of binocide of manganese, the evolution of the gas is greatly facilitated, although the oxides do not seem to undergo any change during the process.

Various processes have been proposed for obtaining oxygen on the large scale, but only in recent years has the commercial production of the gas been carried out sufficiently cheaply to enable oxygen to be employed extensively for industrial purposes. The method employed by Brin's Oxygen Company consists in passing air under pressure over barium oxide, BaO , heated to a temperature of dull redness. In this way a quantity of barium peroxide, BaO_2 , is formed, and this can be made to again yield up its extra oxygen in the pure state (being reduced again to BaO) by heating to a full red heat, or, as is actually done in practice, by greatly diminishing the gaseous pressure without altering the temperature. It is estimated that oxygen can be produced by this process at a cost of from 5s. to 7s. 6d. per 1000 cubic feet. Oxygen can now be obtained in practically any required quantity in wrought-steel cylinders, in which it is compressed up to a pressure of 120 atmospheres.

Of the compounds of oxygen it is unnecessary to speak here, as they are described in the articles on the other chemical elements.

Oxygen was discovered almost simultaneously, in the year 1774, by Priestley and by Scheele, the

English chemist having the precedence by a few weeks. Priestley gave it the name of *Dephlogisticated Air*; Scheele termed it *Empyrean Air*; Condorcet shortly afterwards suggested *Vital Air*, as its most appropriate designation; and in 1789 Lavoisier, who, by a series of carefully conducted and very ingenious experiments, proved that the combustion of bodies in the air consisted essentially in their chemical combination with oxygen, and thus overthrew the *Phlogiston* (q.v.) theory, gave it the name which it now retains (from *oxys*, 'acid,' and *gennaō*, 'I produce'), in consequence of his (erroneously) believing that it was a necessary constituent of every acid.

Oxyhydrogen. See LIME-LIGHT.

Oyer and Terminer (Fr. *ouir*, 'to hear,' *terminer*, 'to determine'). See ASSIZE.

Oyster (*Ostrea*), a genus of bivalves, the members of which are well known to be very passive and very palatable. *Structure.*—The fundamental characteristics, as displayed by the favourite European species, *Ostrea edulis*, are those of other bivalve Molluscs (q.v.), but the 'foot,' with which many less sedentary forms move, is almost completely degenerate, the two valves of the shell are unequal, the hinge which unites them is without teeth, and

Diagram of Internal Structure.

The dorsal surface is downwards, the anterior or head end to the left. *a*, region where water enters and leaves the animal; the dark lines indicate where one mantle-flap has been cut away to expose the other structures; *b*, gills; *c*, margin of one of the mantle-folds; *d*, anterior part of hinge; *e*, hood over mouth; *f*, position of mouth; *g*, *h*, labial palps; *i*, end of intestine; *l*, the closing muscle of the shell; *m*, position of the heart.

the powerful closing muscle is almost median in position. The left valve of the shell, that by which the animal fixes itself, is hollowed out, while the other is almost flat, and the whole animal is slightly unsymmetrical. On an opened oyster it is easy to detect the fringed mantle which lines and makes the shell, the ciliated gills or 'beard,' two somewhat similar flaps (labial palps) on each side of the mouth, which, overhung by a hood, lies near one end of the hinge, the brownish digestive gland, the heart and the kidneys close beside the shell-shutting muscle. 'I suppose,' says Professor Huxley, 'that when the sapid and slippery morsel—which is and is gone like a flash of gustatory summer lightning—glides along the palate, few people imagine that they are swallowing a piece of machinery (and going machinery too) greatly more complicated than a watch'—in fact a living organism of a high order.

General Life.—The oyster feeds on microscopic organisms which are washed into the gaping shell and on to the mouth by the ciliary activity of the gills and palps; and it may be noted that the greenish tinge, regarded by epicures as one of the highest credentials of an oyster, is probably due to a copious diet of minute green algae. As every one knows, oysters live gregariously in 'beds' or

'banks' at depths of 3 to 20 fathoms, and are strangely fastidious as to locality. They have many enemies besides the dredger, such as the little sponges (*Clione*), which bore in the shells; marine worms, and sea-snails (e.g. *Purpura* and *Murex*), which also effect an entrance; besides starfishes, which swallow little ones intact, or, embracing larger specimens, insert their arms when the shells gape. Although these passive animals have no eyes or ears they can detect the shadow of an approaching boat; the mantle-fringe and some other parts are undoubtedly sensitive; and some enthusiasts have even inferred 'intelligence' from the fact that in the 'oyster-schools' and elsewhere the molluscs learn to keep their shells shut when the tide retires or when they are transported by rail!

Life-history.—There are many interesting facts connected with the life-history of the oyster. Thus, *O. edulis* is hermaphrodite, being first an egg-laying female, afterwards a sperm-producing male, while *O. angulata* and the American *O. virginica* have the sexes separate. Maturity is sometimes rapidly attained, but usually not until the third or fourth year of life, and the maximum fertility is between the fourth and seventh year. The reproductive season generally begins in May, and continues till the beginning of autumn, but its limits are extended or lessened by the conditions of temperature. When the oyster becomes 'sick,' 'milky,' or 'out of season,' the mantle-cavity and the inter-spaces between the gills are packed with developing eggs, which fishermen call 'white,' and at a later stage 'black spat.' Buckland likened this black spat to fine slate-pencil dust, and the emergence of the young from the mother to a puff of smoke from a railway-engine. He computed the number of developing eggs in an oyster at from 276,000 to 829,000; and Professor Möbius, the greatest German authority on oysters, calculates that 1000 full-grown parents produce 440 million embryos annually.

These embryos are only about $\frac{1}{16}$ th of an inch in length, and about two millions of them might be packed into a cubic inch, but the numbers which rise from an oyster-bank are so immense that the water seems to be clouded. They are very unlike the adults in habit, for they swim actively for some days by means of a protrusible ciliated cushion or *velum*. The valves of the shell are transparent and symmetrical; the gills, palps, and some other adult structures have yet to be developed. In the American oyster, the eggs are set adrift at an early stage, fertilisation and the whole of development taking place outside the shelter of the parent. In either case the mortality is enormous; multitudes are washed away to unsuitable localities, and multitudes are devoured by hungry animals; in fact Möbius computes that out of 440 million embryos only 421 individuals reach maturity.

Those that survive become weighted by their growing shells, draw in their ciliated velum for the last time, and sink to the bottom as a 'fall of spat.' They settle on stones, shells, or other 'culch,' and often nowadays on chalked tiles or on floating collectors which are placed for the purpose of receiving them. Moored by their left shells, they grow rapidly, from $\frac{1}{16}$ th of an inch when first attached, till at the end of six to eight months they are like threepenny pieces, and are known as 'brood.' The diameter of an oyster at two years is about two inches, another inch is added in the third year, after which the growth is much less rapid.

Different Kinds.—Oysters are represented by several widely distributed species—e.g. the European *O. edulis* and *O. angulata*, the American *O. virginica* with several varieties, two others from the western coasts (*O. conchophila* and *O.*

lurida)—all of them edible, while the Cape of Good Hope, Australia, Japan, &c. are not without their share. They vary considerably in size; those from 3 to 6 inches are common, but Sir J. E. Tennent found one in Ceylon measuring a little over 11 inches in length. American oysters are often very large. The banks of oysters sometimes form important marine and shore deposits—witness the banks of long, narrow 'raccoon' oysters off the coast of Georgia and other parts of North America, which are said to form natural breakwaters. The race is an ancient one, for oysters appear in the Carboniferous strata, and two related forms—*Gryphæa* and *Exogyra*—with thick heavy shells, are common fossils. The name is sometimes extended to other bivalves, such as the false oyster *Anomia* (one valve of which is perforated by a tag of attaching byssus), the pearl-oyster *Meleagrina* (see PEARL), and the thorny oyster *Spondylus*.

Edibility.—The accumulations of oyster-shells in the 'kitchen-middens' of Neolithic ages show that the appreciation of oysters is no modern taste. To Roman palates the oyster was precious, and the praises of its appetising flavour (*grata ingluvies*) were often sounded. Those of Rutupia (Richborough, in Kent) were early known to the epicures and highly esteemed. When eaten alive or half-alive in the usual fashion, they are not only pleasant, but nutritious and readily digested, nor can any evil effects (such as parasites) be traced to moderate indulgence in these dainties. 'The points of an oyster are,' Frank Buckland says, 'first the shape, which to be perfect should resemble very much the petal of a rose-leaf. Next, the thickness of the shell; a first-class thoroughbred native should have a shell of the tenuity of thin china or a Japanese tea-cup. It should also have an almost metallic ring, and a peculiar opalescent lustre on the inner side; the hollow for the animal of the oyster should be as much like an egg-cup as possible. Lastly, the flesh itself should be white and firm, and nut-like in taste. It is by taking the average proportion of meat to shell that oysters should be critically judged. The oysters at the head of the list are of course "natives" (oysters artificially reared); the proportion of a well-fed native is one-fourth meat. The nearest approach to natives, both in beauty and fatness, are the oysters of Milford in South Wales. The deep-sea oysters, such as the white-faced things dredged up in the Channel between England and France, are one-tenth meat; while the very worst are some Frenchmen, which are as thin and meagre as French pigs.'

Demand.—Of the enormous consumption of oysters a few statistical illustrations may be interesting. Thus, it was estimated some years ago that 500 millions were sold annually in London, at a cost of £100,000; but the supply has somewhat decreased, and the price per hundred correspondingly increased. The total British expenditure in oysters has since been calculated at £2,000,000, for about 240 million oysters at twopence each. In Paris the annual consumption is said to be over 100 millions, which cost, it is said, 1,654,359 francs in 1853, 2,186,000 in 1859, and 4,260,000 in 1888. According to the United States census of 1880, the business gives employment to over 52,000 persons and over 4000 vessels, and involves an investment of over \$10,500,000. More than 22 million bushels are produced, and these sell for nearly \$13,500,000. The industry has developed enormously within recent years: in New York state alone the capital invested now exceeds \$6,000,000. Oysters are sent from Baltimore, New York, and other principal markets in car-loads to the west—to Milwaukee, Chicago, St Louis, and even San Francisco. The great beds occur in Long Island Sound and Chesapeake Bay;

the former is in part surveyed and divided into plots, not to exceed 500 acres for any one person, for oyster-culture. The bivalve is found, however, from the Gulf of St Lawrence to and along the north shore of the Gulf of Mexico, and, though smaller, at points on the west coast, as Puget Sound and Juan de Fuca Strait. In some parts of the United States the Clam (q.v.) rivals the oyster in popularity.

Supply.—The British supply is derived from three sources—from the national oyster-banks, which are gradually getting the attention which they deserve; from the continental banks and farms, especially those of France and Holland; and from the United States, with which a trade amounting to about half a million dollars annually has rapidly grown. Moreover, it must be noted that young oysters are largely imported from France and elsewhere to be 'fattened' on British culture-grounds. The practical problem is to keep up a supply sufficient to meet the large demand. For various reasons this seems to be difficult. As oysters live in 3 to 20 fathoms of water, they can hardly be gathered with much selection; they are sometimes lifted by 'rakes' and tongs, but usually by the dredge; this is a destructive process, probably killing more than it secures. There seems some evidence to show that sheer over-dredging has almost ruined some of the banks, but this probably has been exaggerated. Changes in the sea-bottom and in the food-supply have doubtless had more to do with the disappearance of oysters from localities where they once abounded. Those who permit all kinds of debris and foulness to be emptied into the sea can hardly expect a flourishing oyster-bank in the neighbourhood. To preserve the beds, to observe 'close time,' to re-stock when the supply wanes, and similar practical precautions are certainly effective; but regulations which are satisfactory on paper are often very unsatisfactorily realised. The reader should consult the Parliamentary Reports on *British Oyster Fisheries* (1870), and on the increasing scarcity (1876).

Oyster-culture.—Another practical endeavour which has been richly rewarded is that of artificial oyster-culture. This is of course no novelty, having been practised by the Romans. Thus, Pliny says that 'the first person who formed artificial oyster-beds was Sergius Orata (in the time of Augustus), who established them at Baia . . . not for the gratification of gluttony, but for the sake of gain, as he contrived to make a large income by the exercise of his ingenuity.' In the days of the later emperors there were well-established *ostrearia*, and Lake Fusaro, the Acheron of Virgil, a muddy salt-water pond, nowhere more than six feet in depth, has been for many centuries utilised for this purpose. Of oyster-culture there are many different kinds; it may be confined to 'fattening' oysters in some conveniently constructed pond; or 'fallen spat,' collected on tiles or artificial 'culch,' may be brought to the sheltered culture-grounds, where the young can grow in safety; or again, oysters may be bred in confinement, as Professor J. A. Ryder has succeeded in doing in America. In this last case the oysters were kept in a pond separated from the sea by a sandbank, through which water alone came and went with the tide; they produced eggs, these grew into 'spat,' the young fell on suitable collectors, which were afterwards removed to the natural beds. It has even been found possible to fertilise the eggs artificially with sperm from male oysters, and though this is not so feasible in the case of the European species, whose eggs are retained within the parent until they have to some extent developed, there is no theoretical obstacle against breeding them in confinement. Another possibility is to collect the free larvæ, which are

sometimes very abundant, and transfer them to culture-grounds where the risks of mortality would be lessened. The success which has already attended various forms of oyster-culture, of which details will be found in the reports cited below, certainly warrants further extension and experiment, especially as many authorities believe that there is more hope in this than in any legislative measures to preserve the natural banks. Arcachon (q.v.) and Cancale are important French seats of oyster-culture; in England Whitstable is most notable. The frost of the winter of 1890-91 was estimated to have done £15,000 of damage to the oysters of two companies at Whitstable.

See Parliamentary Reports on *Oyster Fisheries* (1870, 1876, 1878); Report of the United States Fisheries Commission, viii., which contains not only the results of American observations and experiments, but translations of valuable memoirs by Hoek, Hubrecht, and Möbius; Report of Scotch Fisheries Board (J. H. Fullarton on *Oyster-culture in France, &c.*, 1890; Möbius, *Die Auster und die Austernwirtschaft* (1877); E. Ingersoll, *The Oyster Industries of the United States* (1881); W. K. Brooks, *Development and Protection of the Oyster in Maryland* (1884), and *Studies from Biol. Lab.* (vol. i. 1890); Huxley, in *English Illust. Mag.* (vol. i. 1883); Marquis of Lorne, in *Good Words* (1890); Philpot, *Oysters and all about them* (1890).

Oyster-catcher (*Hematopus*), a genus of birds of the family Charadriidae, closely allied to the Plovers, and distinguished chiefly by the long, strong, straight, wedge-shaped bill, legs of moderate length, feet with only three toes, all directed forwards and united at their base by a small membrane. The genus, which is cosmopolitan in its distribution, embraces nine species. The only European species, *H. ostralegus*, known also as the Sea-pie and Mussel-picker, is found on many parts of the English coast, and is common in Scotland along the whole east coast, on the adjacent islands even as far as St Kilda, and also on the Irish coasts. Although a coast bird, it often wanders inland, and may be found breeding near inland lochs and on the banks of large rivers. It occurs in Greenland, is common in Iceland, and in many parts of Europe, Asia, and Africa. Its southern

Oyster-catcher (*Hematopus ostralegus*). ●

migrations extend to Burma, Ceylon, Persia, Mozambique, and Senegambia. The adult bird is about 16 inches long, has black and white plumage, orange-yellow bill, crimson irides, and flesh-coloured legs and toes. It is very regular in its feeding habits, passing with great punctuality to and from its feeding-grounds, where it regales itself with mussels, whelks, limpets, annelids, crustaceans, and small fish. Its eggs, usually three or four in number, are laid on shingle, more rarely among sandhills or even in fields inland, and sometimes on the top of a fairly lofty stack. The oyster-catcher swims well, and takes to the

water of its own accord. Its flesh, though dark in colour, is palatable. *H. capensis* is a black species ranging from the Cape to the Canaries. Three or four species are confined to America.

Oyster Plant. See SALSIFY.

Ozæna (Gr. *ozē*, 'a stench') is generally used of all diseased conditions of the nose accompanied by great fetor of the breath. This may arise from the ulcerations occurring in tubercular or syphilitic disease, or in lupus; from malignant disease; from necrosed bone; or from the presence of a foreign body. But it also occurs where none of these causes is present; and to this form of disease the term is limited by some recent writers (Fränkel, Morell Mackenzie, and others). In these cases there is a peculiar form of inflammation of the mucous membrane of the nose, called *dry catarrh*, in which the morbid secretion accumulates in the form of crusts in the nasal cavity. This may occasion comparatively little inconvenience, till it leads, as it often does, to the occurrence of an offensive and characteristic odour, the precise cause of which has not been ascertained. It is a very chronic and troublesome disease; but much relief is obtained by the frequent use of alkaline and antiseptic washes or sprays. An arrangement devised by Gottstein renders the secretion moist, and so keeps the fetor in abeyance—the introduction of a plug of cotton-wool, which is worn in each nostril for a few hours daily.

Ozanam, ANTOINE FRÉDÉRIC, was born at Milan, April 23, 1813, studied at Lyons and Paris, and was appointed in 1841 to fill the chair of Foreign Literature at the Sorbonne. He died at Marseilles, September 8, 1853. Ozanam possessed learning and industry, but fate did not favour him in his dream of rivalling the work of Gibbon, save in such fragments as *Dante et la Philosophie Catholique au XIII^e Siècle* (1839), *Histoire de la Civilisation au V^e Siècle* (1845; Eng. trans. 1868), and *Études Germaniques* (1847-49). A collected edition of his writings fills 11 vols. (1862-75). There are Lives by Karker (Paderborn, 1867), O'Meara (Edin. 1876), and Hardy (Mainz, 1878).

Ozokerite. See BITUMEN.

Ozone (Gr. *ozō*, 'I smell'). It was remarked long ago that a peculiar odour was produced by the working of an electrical machine. Van Marum found that, when electric sparks were passed through a tube containing oxygen, the gas became powerfully impregnated with this odour—which he therefore called the 'smell of electricity.' Subsequent writers attributed the phenomenon to the formation of nitric acid, due to a trace of nitrogen mixed with the oxygen; especially as the gas was found to act energetically upon mercury. Thus supposed to be explained, these curious results were soon forgotten. But in 1840 Schönbein (q.v.) with remarkable acuteness made a closer investigation of the question, and arrived at many most curious results, all of which have not even yet been satisfactorily accounted for. The problem remains, in fact, one of the most perplexing, as well as interesting, questions imperfectly resolved in chemistry. The earlier results of Schönbein were these: (1) When water is decomposed by the voltaic current, the electrodes being of gold or platinum, the oxygen (which appears at the positive pole) possesses in a high degree the smell and the oxidising power developed by Van Marum by means of friction-electricity. (2) When the positive electrode is formed of an oxidisable metal these

results are not observed, but the electrode is rapidly oxidised. (3) The oxygen collected at a platinum electrode retains these properties for an indefinite period if kept in a closed vessel; but loses them by heating, by the contact of an oxidisable substance, and even by contact with such bodies as charcoal and oxide of manganese. To the substance, whatever it may be, which possesses such powerful chemical affinities, Schönbein gave the name ozone, from its smell. In 1845 he showed that the same substance can be produced by the action of phosphorus on moist air, and hinted that it might be a higher oxide of hydrogen.

De la Rive and Marignac shortly afterwards, repeating the experiments of Van Marum, showed that electric sparks produce ozone even in *pure* and *dry* oxygen, and came to the conclusion that ozone is oxygen in an *allotropic* state, as diamond is a form of coke or charcoal. Baumert, in 1853, endeavoured to show that there are two kinds of ozone—one formed from pure oxygen by electric sparks, which he allowed to be allotropic oxygen; the other formed in the voltaic decomposition of water, which he endeavoured to prove to be a *teroxide* of hydrogen. Andrews, in 1856, refuted this view, by showing that no such oxide of hydrogen (at least in a gaseous form) is produced in the electrolysis of water; and that ozone, from whatever source obtained, is the same body, and is not a compound, but an allotropic form of oxygen.

In 1860 Andrews and Tait published the results of a series of *volumetric* experiments on this subject, which led to some remarkable conclusions—among which are the following: When the electric discharge is passed through pure oxygen it *contracts*, hence ozone must be denser than oxygen. A much greater amount of contraction, and a correspondingly greater quantity of ozone, are produced by a silent discharge of electricity between fine points than by a brilliant series of sparks. The contraction due to the formation of the ozone is entirely removed by the destruction of the ozone by heat; and this process can be repeated indefinitely on the same portion of oxygen.

Soret subsequently determined the density of ozone as compared with that of oxygen, first by absorbing the ozone from the oxygen with which it was mixed by means of oil of turpentine or oil of cinnamon, and observing the contraction produced; and later by determining the relative rates of diffusion of chlorine and ozone. He ascertained that its density is one and a half times that of oxygen. Andrews showed later that ozone is rapidly destroyed when shaken up with dry fragments of glass, &c. He also proved that the effect which is (almost invariably, and sometimes in fine weather powerfully) produced by the air on what are called ozone-test papers—papers steeped in iodide of potassium which are rendered brown by the liberation of iodine—is really due to ozone. He did so by showing that it acts upon mercury as ozone does, and that it is destroyed by heat at the same temperature.

The quantity of ozone in the atmosphere is never great, and it varies within wide limits. Little or nothing is known as to its function in the air, but it is believed to be active in destroying unwholesome substances, owing to its intensely oxidising properties. Ozone has been liquefied by the application of pressure, at a temperature of about -23° C. It is stated to be blue in the liquid state, and to be liable to decomposition into oxygen, with explosive violence, on sudden diminution of pressure.

P

is the sixteenth letter in our alphabet. The symbol was derived from the hieroglyphic picture of a shutter (see ALPHABET). When taken over by the Semites, the sign was called *pe*, 'the mouth,' a name explained by the fact that in the Egyptian hieratic, from which the Phœnician sign was obtained, there are strokes resembling teeth, which, however, disappeared before the date of the earliest extant Phœnician inscriptions. The oldest Greek form was ϖ, which differs little from the Phœnician letter. In the Latin alphabet the hook gradually became a loop, giving the form P, and this being the old form of R, the latter acquired a tail to distinguish it. In the later Greek alphabet P continued to be the sign for *r*, and the sign for *p* was differentiated by lengthening the hook, giving ultimately the form Π for the letter *pi*.

The sound of *p* is the sharp labial mute. Hence it interchanges with other labials, especially with *b*, the flat labial mute. Most languages give a preference to one of these two sounds. Thus, the Etruscans preferred *p*, and have no *b* in their alphabet, whereas the Teutonic languages dislike *p*, especially as an initial. Only six primitive Teutonic words, all probably loan words, begin with *p*, and in Beowulf and Cædmon, taken together, only three such words are found. In Mæso-Gothic the Greek *p* was used by Ulphilas, but only for foreign words, such as Paul, Pontius Pilate, prophet, and presbyter. Most of our English words beginning with *p*, such as plough, parish, people, or prince, are loan words from Greek, Latin, or Celtic. A primitive Aryan *p* corresponds to a Teutonic *f*, and it is only a primitive *b*, a very rare letter, which can correspond to a Teutonic *p*. A Welsh *p* corresponds to a Gaelic *c* and an English *f*. Thus, the Gaelic *mac*, 'son,' is the Welsh *map* or *ap*. The Gaelic *cethair* is the Welsh *pedwar*, and the English *four*; and the Gaelic *coic* is the Welsh *pump*, and the English *five*. Owing to French influence the English prejudice against *p* begins to disappear in the 13th century, and we get *gossip* instead of the older *godsib*, *apricot* for *abricot*, and *purse* for *borse*, though even here the *b* is retained in the derived verb to *disburse*. A *p* also intrudes between *m* and *t*, as in *empty* for the Old English *æmtig*, and in *tempt* from the Old French *tenter*. In Latin *p* intrudes also between *m* and *l*, as in the words *exemplum* and *templum*. In like case, as in *humble* from *humilis*, *b* is usually the intrusive letter in English words.

Pabna, a town of Bengal, India, stands on an arm of the Ganges, 115 miles N. of Calcutta. Pop. 15,267.—The district has an area of 1847 sq. m. and a pop. (1881) of 1,311,728.

Paca (*Calogenys*, i.e. 'hollow-cheek'), a remarkable genus of rodents, allied to the Agoutis (*Dasyprocta*), represented by a single species (*C. paca*), which ranges in Central and South America from Guatemala to Paraguay, east of the Andes. Its cheek-bones are uniquely developed, the zygo-

matic arch being enlarged to form a great cavity on each side. Each communicates by a narrow aperture with the mouth, is lined by mucous membrane, and does not contain food as an ordinary cheek-pouch naturally does. Their function, if they have any, is unknown. The paca is large for a rodent, being about 2 feet in length. It is stout and somewhat pig-like in build, with a large blunt head,

Paca (*Calogenys paca*).

cloven lip, small ears, stump-like tail, thick legs, five-toed feet, and rounded back. The colour is brownish yellow above, whitish below, with whitish-yellow spots or longitudinal bands along the sides. Though somewhat clumsy in form and gait, the paca runs actively, and can swim well. It lives alone or in pairs in the moist forests, especially by sides of rivers, and tends to be nocturnal in its habits. It makes burrows, which are said to have three openings. The female bears only one or two young at a birth. As a vegetable eater, the paca sometimes does damage to sugar-cane plantations and gardens. Its fat, pork-like flesh is much esteemed.

Pace. See YARD.

Pachacamac, a village of Peru, 18 miles SE. of Lima, with the ruins of a temple from which Pizarro took immense treasure.

Pachmarhi, a sanitarium and convalescent depôt for European troops in India, is situated, 2500 feet above the plains, in the Central Provinces, 110 miles SW. of Jabalpur.

Pachomius, an Egyptian monk of the 4th century, the first to substitute for the free asceticism of the solitary recluse a regular cœnobitic system. He was born about 292, and about 340 founded the first monastic institution at Tabenna, an island in the Nile, where ere long there were as many as 1400 monks. He also established the first convent for nuns, which was under the presidency of his sister, and he laboured with so much diligence and zeal that at his death, according to Palladius, not fewer than 7000 monks and nuns were under his inspection. The writings ascribed to Pachomius are not only worthless in themselves, but of dubious authenticity. See the article MONACHISM.

Pachydermata (Gr., 'thick-skins'), a term applied by Cuvier to hoofed mammals (Ungulates) which are not ruminants—e.g. elephants, hyrax, hog, hippopotamus, tapir, rhinoceros, horse, &c.—and which have thick skins. For many good reasons the term is no longer much used. See MAMMALS.

Pacific Ocean.—*Position and Extent.*—The Pacific Ocean is the largest of the great divisions of the ocean, occupying as it does about one-half of the water-surface of the globe and more than one-third of the whole area of the world. It is almost landlocked towards the north, communicating with the Arctic Ocean by the narrow and shallow Behring Strait, only about 40 miles in width, whereas towards the south it opens widely into the great deep Southern and Antarctic Oceans. Looking upon its southern boundary as the Antarctic Circle, its length from north to south is about 9000 miles, while its greatest breadth at the equator is over 10,000 miles. Its area is approximately nearly 70,000,000 sq. m.

History.—The Pacific was first seen by Europeans in 1513, when a Spaniard, Balboa, with a few followers, viewed its waters from the summit of a mountain in Panama; Columbus was aware of its existence, but did not live to see it. The first European to sail upon it was Magellan, who in 1520 entered it after threading his way through the strait bearing his name, and he gave it the designation 'Pacific,' by which it is known to the present day. From about this time trade was established between Europe and the Pacific coasts through the Strait of Magellan and round Cape Horn. Sir Francis Drake was the first Englishman to sail upon it, entering it in 1577, and afterwards sailing across it as far as the Moluccas. The explorers of the 17th century discovered Australia, New Zealand, and other islands, and during the 18th century the work of exploration was carried on by numerous voyagers, whose names are famous in the annals of geographical discovery. Many of them attempted to find passages between the Atlantic and Pacific through the Arctic Ocean; but the problem remained unsolved until Maclure in 1850 discovered the North-west Passage, and Nordenskiöld in 1874 the North-east Passage. The routes are, however, of no practical utility. During the 19th century many exploring and surveying expeditions have completely investigated the region of the Pacific, and among the more recent scientific expeditions special mention may be made of that of H.M.S. *Challenger*.

River-systems.—Compared with the enormous expanse of the Pacific the area of land draining into it is comparatively insignificant—7,500,000 sq. m., being less than half of that draining into the Atlantic. By far the greater proportion of the land of North and South America drains into the Atlantic, the Andes and Rocky Mountains, which form the watershed, running north and south in more or less close proximity to the Pacific coast. The largest American river is the Yukon in the extreme north, which is over 2000 miles in length, and flows into Behring Sea. Proceeding south, we find the Fraser (600 miles long), the Columbia or Oregon (750), the Sacramento (420), and the Colorado (1100). The South American rivers draining into the Pacific are little more than mountain-streams. The Asiatic rivers flowing into the Pacific include some of the largest and most important rivers of the world. There is the Amur, 3060 miles in length, flowing into the sea of Okhotsk, and with its tributaries draining an area of nearly 900,000 sq. m.; the Hoang-ho, over 3000 miles long, and the Yang-tse-kiang, 3200 miles in length, falling into the Yellow Sea, the combined drainage area of which two rivers is estimated to exceed 1,250,000

sq. m.; whilst flowing into the China Sea there are the Choo-kiang, the Mekhong, and the Menam. The rivers of Australia draining into the Pacific are of slight importance and small size. The total annual rainfall on the catchment basin of the Pacific is estimated at about 5000 cubic miles; the annual river discharge at a little over a fifth of that amount.

Coasts and Seas.—Generally speaking, the American and Australian coasts bordering the Pacific are mountainous and free from indentations, while the Asiatic coasts are low and fertile, with many gulfs and bays, and fringed with island groups enclosing numerous seas. The Alaskan shores of North America are low and swampy, while the coast farther south is rocky and rugged, with numerous inlets and off-lying islands. The most considerable indentation of the whole American Pacific coast is the Gulf of California, the Gulfs of Panama and Guayaquil being the only others of importance. The southern extremity of South America presents a complete contrast to the rest of the coast-line, being broken up into numerous bays with scattered islands, the winding Strait of Magellan separating Tierra del Fuego from the mainland. The contour of the Asiatic coast-line is much more diversified than that of America, being especially characterised by the off-lying seas more or less completely enclosed and cut off from communication with the open ocean. Behring Sea is separated from the Pacific basin by the peninsula of Alaska and the Aleutian Islands, communicating with the Arctic Ocean through Behring Strait. The Sea of Okhotsk is divided from Behring Sea by the peninsula of Kamchatka, and from the basin of the Pacific by the Kurile Islands. The Sea of Japan is cut off from the ocean by the Japanese islands, from the Sea of Okhotsk by the island of Saghalien, and from the Yellow Sea by the peninsula of Corea. The Yellow Sea is an extensive indentation of the Chinese coast, and is so named from the large amount of ochreous material brought down by the great rivers Hoang-ho and Yang-tse-kiang, which flow into it. The China Sea is separated from the Pacific by the island of Formosa, the Philippine Islands, the island of Palawan, and Borneo, and from the Indian Ocean by the Malay peninsula; it includes the two extensive Gulfs of Tonquin and Siam. The islands of the East Indian Archipelago cut up this part of the Pacific into several more or less distinct seas, known as the Sulu, Celebes, Java, Banda, and Arafura Seas, the last named lying between the north coast of Australia and New Guinea, and including the Gulf of Carpentaria. The Coral Sea is enclosed by the north-east coast of Australia, New Guinea, New Britain, the Solomon Islands, the New Hebrides, and New Caledonia, and communicates with the Arafura Sea by Torres Strait. The Pacific coast of Australia is mountainous and free from any considerable inlets, the most important harbours being Moreton Bay and Port Jackson, the latter one of the finest in the world. Bass Strait separates the island of Tasmania from Australia. The main islands of New Zealand are separated by Cook Strait, and the principal bays are the Gulf of Hauraki, Bay of Plenty, Hawke Bay, and Pegasus Bay.

Islands.—The Pacific Ocean is remarkable for the innumerable small islands and island groups which stud its surface, but the area occupied by the truly oceanic islands is very small; they are principally congregated towards the central and western portions of its basin, the eastern portion, for some considerable distance off the American coasts, being comparatively free from islands. The principal continental islands may be briefly enumerated: commencing at the southern point of

South America, and proceeding northwards along the American coast, then southwards along the Asiatic coast, we have Tierra del Fuego and the islands off the coast of Chili; Vancouver, Queen Charlotte, Prince of Wales, and other islands off the coast of British North America; Kodiak Island, off the Alaskan coast; the Aleutian chain of islands, stretching from the Alaskan peninsula towards the Asiatic coast and enclosing Behring Sea; the Kurile Islands, stretching from the peninsula of Kamchatka to the Japanese Islands; Saghalien; the islands of Japan; Formosa and Hainan, off the Chinese coast; the Philippine Islands; Borneo, Celebes, Sumatra, Java, and other islands of the East Indian Archipelago; New Guinea; New Caledonia; Australia and Tasmania; and New Zealand. The oceanic islands of the Pacific are all either of volcanic or coral origin, the volcanic islands lying within the zone of coral-reef builders being fringed with coral-reefs, while there are large numbers of islands entirely of coral formation—coral atolls. The principal groups are the Sandwich Islands, in the centre of the North Pacific basin, 18° to 22° N. lat., consisting of eight larger and four smaller islands, containing many active and extinct volcanoes, including the well-known Kilauea in Hawaii, said to be the largest active crater in the world; the Bonin Islands, south-east of Japan; the Ladrone or Mariana Islands, between 13° and 20° N. lat., containing several active volcanoes; the Caroline Islands, south of the Ladrone, mostly of coral formation; the Marshall Islands, east of the Carolines, entirely of coral formation; the Gilbert Islands, on the equator, of coral formation and densely populated; in the South Pacific there are the Solomon Islands, the New Hebrides, the Fiji Islands, the Friendly Islands, the Samoa or Navigator Islands, the Society Islands, all fringed by coral-reefs, and the Paumotu or Low Archipelago, an extensive group of coral islands lying between 10° and 25° S. lat., besides the volcanic Galapagos group on the equator about 600 miles off the coast of Ecuador, and others of less extent and importance.

Depth.—The Pacific was formerly looked upon as rather a shallow ocean, but we now know that some of the greatest depths in the world occur in it, and that on the whole it is deeper than the Atlantic, its mean depth being about 2500 fathoms. The eastern basin is comparatively uniform in depth, between 2000 and 3000 fathoms, except a large area under 2000 fathoms extending from off the coast of Chili in a westerly direction for over 40° of longitude, while off the north-west coast of North America the 2000 fathom line lies a considerable distance off-shore. The western basin is much more diversified, numerous groups of islands, shallow water, and immense depths occurring irregularly; the greatest depths yet sounded are found in this region of the Pacific. The *Challenger's* deepest sounding, 4575 fathoms (nearly 5½ miles), was in the sea between the Caroline and Ladrone Islands, while the American ship *Tuscarora* found a depth of 4655 fathoms to the north-east of Japan, where a large area of very deep water extends off the Kurile Islands and Japanese coast; more recently depths of over 4000 fathoms have been discovered off the coast of Chili, and a British surveying ship has sounded in 4530 fathoms east of the Fiji Islands, which is the deepest sounding recorded south of the equator. There are many detached patches throughout the Pacific with depths of over 3000 fathoms. The seas bordering on the western basin of the Pacific vary considerably in depth: the depth in the Sea of Okhotsk, the Yellow Sea, and the Java Sea does not apparently exceed 700 fathoms; and the Behring Sea, the Sea of Japan, and the Arafura

Sea are all under 1500 fathoms; while the China Sea, Celebes Sea, Sulu Sea, and the Banda Sea are in some places over 2000 fathoms in depth. The bulk of water filling the Pacific is estimated at 170,000,000 cubic miles.

Winds and Currents.—The surface-currents of the Pacific Ocean depend to a great extent upon the direction of the prevailing winds, the principal of which are the two trade-winds, blowing more or less constantly, the one from the north-east, the other from the south-east. Between these two regions is what is called the equatorial belt of calms, which is found all the year round north of the equator in the eastern Pacific, but in the west Pacific it is south of the equator during the summer of the southern hemisphere, and during the southern winter it is replaced by a regular southerly breeze; north and south of the trade-winds, also, there are two other belts of calms. In addition to the trade-winds, there are the monsoons, which blow with great regularity, but the direction of which changes according to the season. Monsoons are especially prevalent in the west Pacific, their general direction being south-east, north-east, or north-west, and they cause surface-currents, the direction of which likewise changes with the season. The differences between the temperature and atmospheric pressure over the land and over the water cause monsoonal winds. In mid-ocean the winds are found to have a greater velocity than in the vicinity of the land.

The Pacific is practically cut off, as far as the circulation of the deep water is concerned, from communication with the Arctic Ocean in the north, but towards the south it has uninterrupted communication with the Antarctic. A cold surface-current flows constantly northwards from the Antarctic, dividing into two at Cape Horn, one entering the Atlantic, the other flowing along the coasts of Chili and Peru, thence turning to the westwards; but the cold water frequently met with along the eastern coasts of America is evidently brought from oceanic depths by the action of off-shore winds. The great equatorial current flows to the westward, divided by a counter-current running in an opposite direction into two branches, the northern one on approaching the Asiatic coast being deflected northwards and finally north-eastwards as the Japan current, which is comparable to the Gulf Stream in the Atlantic; the southern branch is diverted to the southward, flowing along the shores of Australia and New Zealand, thence curving eastwards, and ultimately merging into the Antarctic surface-current. There are many minor currents, and branches of these more important ones, diverted by the numerous groups of islands. The broad currents, circling in the one direction in the North Pacific and in the opposite direction in the South Pacific, enclose in their centres two miniature Sargasso Seas somewhat similar to that of the North Atlantic, though not so well marked.

Temperature of the Water.—The temperature of the surface-waters of the Pacific varies with the season, but in the tropical regions the variation is very small. Between the latitudes of 45° N. and 45° S. the temperature of the surface is always above 50° F., while north and south of these latitudes it is nearly always below 50° F. The highest temperature occurs among the islands of the Malay Archipelago and off the Mexican coast, where the mean temperature rises to 85° F., and in the sea between Japan and New Guinea the temperature in August reaches 84° F. In the South Pacific the temperature of the surface-water is apparently higher than that of the air, while in the North Pacific the reverse is the case in some places. The temperature of the water below the surface

as a general rule decreases as the depth increases, the lowest temperature occurring at the bottom in great depths, where the bottom temperature appears to be nearly constant all the year round, usually about 35° F., varying to a slight extent in different parts of the ocean from 34°·7 to 35°·5 F. This refers only to the open ocean, for in the enclosed seas of the western basin of the Pacific the minimum temperature is usually found some distance above the bottom, depending upon the depth of water over the barrier cutting off the sea from the general oceanic circulation, the body of water below that depth being of a uniform temperature. As a typical example we may cite the Sulu Sea, where at a depth of 400 fathoms a minimum temperature of 50°·5 F. is reached, and this temperature continues down to the bottom in 2500 fathoms. The temperature of the intermediate water in the open ocean decreases rapidly at first from the surface downwards, and then slowly down to the bottom, a temperature of 40° F. being usually met with at a depth of between 300 and 400 fathoms, irrespective of the surface temperature, which may vary from below 60° to over 80° F.

Salinity.—The salinity of the surface-waters of the ocean changes with the season; increase of evaporation raises, while precipitation in the form of rain lowers, the salinity. In the South Pacific there is a region of high salinity in the neighbourhood of the Society Islands, the maximum salinity being 1·02750 (taking pure water at 4° C. as unity); in the North Pacific the salinity is never so high, the maximum being 1·02650, while in some regions the salinity falls to 1·02485. The surface-water of the partially enclosed seas of the western portion of the Pacific is naturally much fresher than that of the open ocean, due principally to the exceptionally heavy rainfall.

Deposits.—The Pacific Ocean, as might be supposed from its great extent and its great range in depth, contains all the varieties of marine deposits from those of shallow water to those found only in the greatest depths of the ocean. These deposits will be dealt with in the article SEA; see also works cited at CHALLENGER, CORAL, POLYNESIA; the *Scottish Geographical Magazine*, vol. iv.; and an article by the present writer in *Nature*, vol. xxxix.

Pacific Railways. See RAILWAY, CANADA, UNITED STATES.

Packard, ALPHEUS SPRING, an American naturalist, son of the historian of Bowdoin College, was born at Brunswick, Maine, 19th February 1839, graduated at Bowdoin in 1861, and was for a time assistant to Agassiz at Cambridge. He took part in several scientific expeditions, was state entomologist of Massachusetts in 1871-73, and lectured at Bowdoin and elsewhere. In 1878 he became professor of Zoology and Geology at Brown University. But he is best known as a distinguished entomologist; his classification of insects, proposed in 1863, has been generally accepted. As an evolutionist, Professor Packard is one of the leaders of the 'Neo-Lamarckian' school (see LAMARCK). Besides popular works and textbooks, his writings include *Structure of the Ovipositor of Insects* (1868), *Development and Anatomy of Limulus Polyphemus* (1871-85), *The Cave Fauna of North America* (1888), *The Labrador Coast* (1891), monographs on the geometrid moths, the locust's brain, phyllopod crustacea, &c.

Packfong, or PETONG, a Chinese alloy or white metal, consisting of arsenic and copper.

Paco. See ALPACA.

Pactolus, anciently the name of a small brook of Lydia, in Asia Minor, which rises on the northern slope of Mount Tmolus (modern *Buz*

Dagh), flows north past Sardis (*Sart*), and empties itself into the Hermus (*Kodus*). It is never more than ten feet broad and one foot deep. The sands or mud of Pactolus were long famous in antiquity for the particles of gold-dust which they contained. The collection of these particles, according to legend, was the source of Cræsus' vast wealth. The brook is now called *Sarabat*.

Pacuvius, the earliest of Roman tragic poets, the sister's son of Ennius, was born at Brundisium about 220 B.C., lived mostly in Rome, and died at Tarentum, ninety years of age (130 B.C.). His dramas, of which only fragments are extant, were formed after Greek models. See Ribbeck, *Tragicorum Latinorum Reliquiæ* (1871).

Padang, capital of a residency on the west coast of Sumatra, and seat of the Dutch governor of the west coast province, is situated at the mouth of the Padang River, and has a brisk trade. Pop. 15,000. The residencies of Padang and the Padang Highlands have a joint pop. of (1886) 869,760.

Paddy. See RICE.

Padella (Ital., 'a frying-pan'; plur. *padelle*), a shallow vessel of metal or earthenware used in illuminations.

Paderborn, a town of Westphalia, situated 50 miles SW. of Hanover, at the sources of the Pader, a tributary of the Lippe. It has been largely rebuilt since a destructive fire in 1875. The fine Romanesque cathedral (Roman Catholic), completed in 1163, is built over the sources of the Pader, and contains the silver coffin of St Liborius. Other noticeable edifices are St Bartholomew's Chapel (1017) and the town-house (1615; restored 1870-76). The manufactures include glass, soap, and tobacco factories, breweries, distilleries, railway and printing works; the town carries on a considerable trade in cattle, fruit, and wool. There are mineral springs close by. At Paderborn Charlemagne held his first diet with the conquered Saxons. It was a Hanse town. In 1622 it was sacked by the Duke of Brunswick, and it changed hands more than once during the Thirty Years' War. From 1614 to 1819 it was the seat of a Roman Catholic university. Pop. (1885) 16,624.

Padiham, a town of Lancashire, 3 miles W. of Burnley and 8 NE. of Blackburn. Cotton is the staple manufacture, with coal-mining and stone-quarrying. Pop. (1881), with Hapton, 8974.

Padilla, JUAN DE, one of the most popular heroes in Spanish history, was a scion of a Toledan family, and was appointed by the Emperor Charles V. military commandant of Saragossa. While he was so employed a formidable rebellion, caused by the excessive taxes which the emperor imposed on the Spaniards, to defray the cost of his various wars in Italy, Germany, and the Low Countries, broke out among the towns of Castile, and the rebels, who were known as *comuneros*, called upon Padilla to put himself at their head. He was successful in a number of enterprises undertaken against the royalist party, but on 23d April 1521 was completely beaten at Villalobos. This conflict decided the fate of the rebellion and of Padilla himself, who was taken prisoner, and next day beheaded. His wife, Donna Maria de Pacheco, rallied the remnants of the rebel army, and for a long time held Toledo against the royalist besieging army; after its fall she retired to Portugal, where she died in 1531. Numerous poems and dramas celebrate their deeds.

Padishah, in Turkish PADISHAH (Persian *padi*, 'protector' or 'throne'; *shah*, 'prince'), one of the titles of the Sultan of the Ottoman empire, and of the Shah of Persia.

Padua (Ital. *Padova*), a city of North Italy, 23 miles by rail W. by S. of Venice and 18 SE. of Vicenza, is still surrounded with walls. The principal streets are lined with arcades; most of the others, especially in the older parts, are narrow, dark, and ill-paved; but there are several handsome squares and fine gates. The first place among the public buildings belongs to the municipal palace (1172-1219), a huge structure resting on arches, with balconies running round the upper story. The roof (1420) of its great hall (267½ feet long, by 89 wide, and 78 high) is perhaps the largest in Europe unsupported by pillars. The churches (nearly fifty) include the cathedral (1552-1754); St Antony (1230-1307), said to have been designed by Niccolò da Pisano, a building in the Pointed style, with Byzantine blendings, and a richly decorated interior by Donatello, Sansovino, and others—the bones of St Antony rest in a side-chapel; St Justina (16th century), a fine Renaissance church, with an altarpiece by Veronese, and other pictures; church of the Eremitani (13th century), with frescoes by Mantegna; the chapel of the Annunciation (1303), adorned with frescoes by Giotto; and the chapel of St George (1377), with frescoes by Avanzi and Altichieri. The 'saint's school' is adorned with frescoes by Titian and his pupils, illustrating the life of St Antony. Donatello's fine equestrian statue of Gattamelata, the Venetian captain, stands in front of the church of St Antony. Padua has enjoyed greatest fame from her university, founded by the emperor Frederick II. in 1221, though the fine Renaissance buildings date from 1493-1552; there are now 80 teachers and 1100 students. To it is attached one of the oldest botanical gardens in Europe, and a library (1629) of 158,500 vols. and 2500 MSS. The city museum (1831) contains antiquarian, art, and numismatic collections, a library, and archives. There is not much industry or much commerce, though leather, cloth, and gut-strings are prepared. Pop. (1881) 47,334. Padua's most celebrated natives were Livy and Mantegna. One of the oldest cities in Italy, *Patavia* came under the Roman supremacy in 215 B.C. In the 5th century it was severely handled by the Huns, and was bandied to and fro between the Goths and the Eastern empire. From the Lombards it passed to the Franks (774); during the Guelph and Ghibelline quarrel it alternately submitted to the emperors and sided with the Lombard cities. In 1318 it took to itself as lord the head of the Carrara family, who ruled it till it was conquered by Venice in 1405. Venice kept it till 1797, when it was given to Austria, who held it (except from 1805-14) until it was incorporated in Italy in 1866. The province has an area of 797 sq. m. and pop. (1889) of 437,656.

Paducah, capital of McCracken county, Kentucky, on the Ohio River, 48 miles above its mouth, and just below the entrance of the Tennessee, 226 miles by rail WSW. of Louisville. It has a large trade by river and rail, and contains shipyards, foundries, railway-shops, flour, saw, and planing mills, and manufactories of soap, vinegar, ice, furniture, tobacco, &c. Pop. (1880) 8036; (1890) 13,076.

Pæan (of doubtful etymology), the name given by the ancient Greeks to a kind of lyric poetry originally connected with the worship of Apollo.

Pædo-baptism. See BAPTISM.

Pæony. See PEONY.

Pæstum, anciently a Greek city of Lucania, in Southern Italy, on the present Gulf of Salerno. It was founded by the Sybarites some time between 650 and 600 B.C., and was originally called Poseidonia. It was subdued by the Lucanians, and from them passed to the Romans, who established

a colony there about 273 B.C. The Latin poets sing the praises of its roses, which bloomed twice a year. Pæstum was burned by the Saracens in the 9th century, and ravaged by Robert Guiscard in the 11th, and never recovered from these disasters. Portions of the ancient walls and three well-preserved Doric temples remain. See Labrousse, *Les Temples de Pæstum* (1877).

Pagán. See BURMA, Vol. II. p. 566.

Paganini, NICOLÒ, the famous violinist, was born a porter's son at Genoa on 18th February 1784. His genius showed itself early, and, practising sometimes a single passage for ten hours running, he acquired a mastery over his instrument that has never been equalled; the vulgar, indeed, ascribed it to diabolic agency. It must be confessed he was too much addicted to mere feats of musical legerdemain. He gave his first concert as early as 1793; began his professional tours in Italy in 1805; in 1827 received from the pope the order of the Golden Spur; in 1828-29 made a great sensation in the chief towns of Austria and Germany; and in 1831 created an equal *furor* in Paris and London. He had gambled much in youth, but he returned very rich to Italy; and he died at Nice on 27th May 1840, drawing a last long note on his favourite G string.

See his *Life* in French by Fétis (1851), in Italian by Bruni (1873), and in German by Niggli (1882); also vol. ii. of Grove's *Dictionary of Music* (1880), and Engel's *From Mozart to Mario* (1886).

Page (derivation variously assigned to Gr. *pais*, 'a boy,' and Lat. *pagus*, 'a village'), a youth of noble or good birth employed in the service of a royal or noble personage. The practice of employing youths of noble birth in personal attendance on the sovereign existed in early times among the Persians and Romans, and was a special feature of feudal chivalry in the middle ages. The degree of page was preparatory to the further degrees of esquire and knight. The practice of educating the higher nobility as pages at court began to decline after the 15th century. Pages still figure, however, on ceremonial occasions at the chief courts of Europe. The Corps of Pages at St Petersburg is a cadet school for the Russian Guards.

Paget, SIR GEORGE EDWARD, K.C.B., was born at Yarmouth in 1809, and educated at the Charterhouse and at Cambridge. He took his B.A. degree in 1831, became Fellow of Caius in 1832, M.D. in 1838, D.C.L. Oxford and Durham, LL.D. Edinburgh, and F.R.S. in 1855. In 1872 he was appointed regius professor of Physic in Cambridge, and became K.C.B. in 1885. Sir G. Paget may well be regarded as a public benefactor, as having taken the principal part in the great advance that has been made of late years in the education of medical practitioners.—His brother, SIR JAMES PAGET, Bart., was born at Yarmouth in 1814. He became member of the Royal College of Surgeons in 1836, Hon. Fellow in 1843, member of the Council in 1865, president of the College in 1875, Bradshawe Lecturer in 1882. Serjeant-surgeon to the Queen, surgeon to the Prince of Wales, and consulting surgeon to St Bartholomew's Hospital, he was created baronet in 1871, and in the same year LL.D. of the university of Edinburgh. Two standard works are *Lectures on Surgical Pathology* (1853; 4th ed. 1876), and *Clinical Lectures* (1875). He is vice-chancellor of the university of London, and a member of the Institute of France (Academy of Sciences).

Pagoda (a Portuguese corruption of the Persian *but-kadah*, 'idol-temple') is originally an Indian temple of the approximately pyramidal shape especially characteristic of the Dravidian style (see Vol. VI. p. 109). Thus, the great pagoda at

Tanjore has a perpendicular part two stories in height, 82 feet square, and above that thirteen stories, forming an elongated pyramid about 100 feet high. The basement section is simple in outlines, but adorned by niches and pilasters; the pyramidal portion is somewhat elaborately sculptured; and the whole is crowned by a dome (said to consist of a single stone), which brings the total height to 190 feet. The temple stands in one of two great courtyards, and in the same court stand several small shrines, one of which is so beautifully carved as to rival in interest the great temple.

Pagoda at Tanjore.

The date of the latter is not certainly known, but is with much probability referred to the beginning of the 14th century. The so-called 'Thousand Pagodas' of Brambanan (q.v.) in Java are obviously modelled on Hindu originals, either Jain or Buddhist. The Burmese pagodas are described and

Chinese Pagoda of Thirteen Stories.

illustrated at Vol. II. p. 565. The term is also loosely applied to the Chinese *taa*, or tapering tower, of which the most famous was the Porcelain Tower of Nanking, described at Vol. III. p. 186. This was erected in the beginning of the 15th century; only nine of the proposed thirteen stories, cased in white porcelain, were completed, and the height never exceeded about 260 feet. It was destroyed by the Taipings in 1856. First-class pagodas have seven, nine, or thirteen stories, the more numerous second-class ones

usually three or five. Pagodas are occasionally still erected—sometimes of iron.

Pahlanpur, or PALANPUR, a town of India, capital of a native state (area, 3150 sq. m.; pop. 234,402) of the same name, 83 miles N. of Ahmadabad in Bombay Presidency. Pop. 17,547. The *Pahlanpur agency* comprises Pahlanpur and twelve other states in the north of Bombay, with an area of 8000 sq. m. and a pop. (1881) of 576,478.

Paine, THOMAS, deistical and radical writer, was born at Thetford in Norfolk on 29th January 1737, the son of an ex-Quaker staymaker. He himself had by turns been staymaker and marine, schoolmaster, exciseman, and tobacconist, had married twice, losing his first wife, and soon divorcing the second, when in 1774, with introductions from Franklin, he sailed for Philadelphia. On 1st January 1776 appeared his pamphlet *Common Sense*, which argued simply but strongly for complete independence, and which in Washington's words, 'worked a powerful change in the minds of many men.' His *Crisis*, a twelvemonth later, gave the battle-cry, 'These are the times that try men's souls,' for the Americans' first victory at Trenton, where Paine himself was serving as a private; and congress rewarded him with the post of Secretary to the Committee of Foreign Affairs. He lost that post in 1779 for divulging state secrets, but was appointed clerk of the Pennsylvania legislature, and in 1785 received from congress \$3000 and the confiscated farm of New Rochelle. In 1787 he returned, by Paris, to England, where in 1791-92 he published *The Rights of Man*, the most famous of all the replies to Burke's *Reflections upon the French Revolution*. The work, of which a million and a half copies were sold in England alone, involved many in heavy penalties; Thomas Muir, for instance, for circulating it got fourteen years' transportation. Paine, however, had slipped off to Paris, having been elected by the department of Pas-de-Calais its deputy to the National Convention. Here he voted with the Girondists, and at Louis XVI.'s trial he 'alone,' says Madame de Staël, 'proposed what would have done France honour—the offer to the king of an asylum in America.' He thereby offended the Robespierre faction, and in 1794 was thrown into prison; just before his arrest having written part i. of *The Age of Reason*, against Atheism and against Christianity, and in favour of Deism. Part ii. appeared in 1795, and a portion of part iii. in 1807. The book alienated Washington and most of his old friends; and it was not till after an imprisonment of eleven months that he was released and restored to his seat in the Convention. He became, however, disgusted with French politics, and occupied himself chiefly with the study of finance, till in 1802 he returned to America in a ship placed at his service by President Jefferson. His last years were sullied by intemperance, and he died at New York on 8th June 1809. In 1819 his bones were removed by Cobbett (q.v.) from New Rochelle to England; their whereabouts since 1847 is unknown. 'Paine's ignorance,' says Leslie Stephen, 'was vast and his language brutal; but he had the gift of a true demagogue—the power of wielding a fine vigorous English.'

The completest edition of his works is that by Mendum (3 vols. Boston, 1850); of his numerous biographies may be mentioned those by 'Francis Oldys' (i.e. George Chalmers, 1791), Cheetham (1809), Rickman (1814), Sherwin (1819), Vale (1841), and Blanchard (1860). See also Leslie Stephen's *History of English Thought in the Eighteenth Century* (1880); an article by Moncre D. Conway in the *Fortnightly* for March 1879; and Alger's *Englishmen in the French Revolution* (1889).

Pains and Penalties. See ATTAINDER.

Painted Lady. See BUTTERFLY, II. 589.

Painter, WILLIAM, author of the *Palace of Pleasure*, was most probably a Kentishman, and born about 1525. He seems to have been master of Sevenoaks school about 1560, but early next year became Clerk of the Ordinance in the Tower, with a stipend of eightpence a day. He kept this post all his days, married, seems to have had a somewhat easy standard of honesty, grew rich, and bought lands. He made his will in 1594, and died probably soon after. In 1568 he published the first volume of *The Palace of Pleasure* 'beautified, adorned, and well furnished, with Pleasant Histories and Excellent Nouells selected out of divers good and commendable authors;' the second volume, 'containing manifold store of goodly Histories, Tragical matters, and other Moral argument, very requisite for delight and profit,' followed in 1567. Of the first volume the principal source was the *Heptameron*; of the second, Bandello, through the medium of the French translations of Boastuau and Belleforest; but, in the definitive edition of the whole work (1575), to both parts stories were added from Boccaccio, Ser Giovanni, and Straparola. These last two at least he must have taken directly from the Italian. Painter's work became exceedingly popular, and indeed was the main source whence many dramatists drew their plots. Even in almost all Shakespeare's comedies we see the prevalence of the convention in early English comedy in favour of Italian plots, names, and places. Ascham in the *Scholemaster* denounces the 'bawdie stories . . . enchantments of Circes, brought out of Italie, to marre mens maners in England,' and there can be little doubt that here he points directly at Painter, though he does not name his book. Painter's English is easy and unaffected, but lacks the dignity the reader expects of an Elizabethan. His book is the largest work in prose between the *Morte Darthur* and North's *Plutarch*, but its real importance is that it introduced into our literature many of the best novels of Boccaccio, Bandello, and Margaret of Navarre.

Joseph Haslewood edited an admirable edition in 1813 (2 vols.); a later is that by Joseph Jacobs (3 vols. 1890).

Painter's Colic. See LEAD-POISONING.

Painting. It is convenient to divide this slight sketch of the history of painting into two sections, the first dealing with the technical, and the second with the intellectual, history of the art.

(1) *The Technical History of Painting.*—The importance of technical conditions in the fine arts is due to their influence upon the action of the mind. For example, fresco-painting, if genuine, requires both speed and decision, oil-painting permits deliberation and correction almost without limit. Water-colour occupies, as to hurry, a position between the two. A technical facility allures the mind in certain directions, a technical difficulty impedes it, and a technical impossibility, like an insurmountable obstacle, diverts its energy into another channel. Each art has its own educational influence on the artist who practises it. Albert Dürer was an engraver with the burin, and he carried the strictness and precision of the burin into his painting; Rembrandt was an etcher, and he painted with an etcher's freedom; Turner was a water-colour painter, and his practice in oil bears evidence of his other skill. Fresco was painted either from drawings or from pure imagination. The deliberation possible in oil has led to painting from the life, with its consequences of increased reality, better knowledge, and more perfect truth. The improvement in water-colour has done for landscape what oil has done for the figure. As water-colour dries quickly it is convenient for sketching from nature, so that modern landscape-painters have been induced to study more in colour

than their predecessors, a practice which has brought about a revolution in landscape-painting by taking it from the studio and the gallery into the open air.

The extreme importance of technical conditions may be made still clearer by a reference to the sister arts. With the burin in his hand, the most impetuous of men must be disciplined by the instrument itself till he becomes cautious, careful, and methodical. A sculptor may love marble, but he does not sketch or invent in it; he sketches in wax or clay. Bronze can be cast into the most picturesque forms, but the granite of Egypt imposed a severe simplicity.

Painting was not, in its origin, an independent art. It was employed in subservience to sculpture, to architecture, and to primitive engraving quite unconnected with printing. Rude idols were coloured in imitation of life, or rude outlines incised in stone or wood were filled up with spaces of colour sharply separated and clearly distinguished. The outlines might also be themselves painted and then filled up with colour. Painting was separated from sculpture and engraving long before it was separated from hard and definite linear drawing. The connection of painting with the hard line is always evidence of a primitive condition of the art, either simple-minded as in early work, or affected in modern work as an archaic fancy, or continued for decorative reasons.

The earliest painting known to us is that of the ancient Egyptians, a kind of distemper or water-colour with dissolved gum. They had a sufficiently well-supplied palette. White, a light yellow, a duller yellow, light red, dark red, light blue, green, brown, and black appear to have constituted their list. As for the chemical nature of these pigments, pure chalk supplied a white; the Egyptians were acquainted with a vegetable yellow; they were familiar with the ochres; cinnabar was to be had in Ethiopia; their blue was powdered blue glass, itself stained with copper, and when mixed with yellow it supplied a green. Black was easily obtained from animal charcoal and other materials. It is a misunderstanding of Egyptian art to criticise it as a representation of nature; that was rendered impossible by ignorance of perspective and other technical deficiencies. It was intended to be at the same time a record and a decoration, and it effectually answered both purposes. It is much too primitive to be artistic in the modern sense, and in fact the Egyptian painters were not artists but workmen subjected to authoritative direction and to an excessive division of labour. Their drawing was manually skilful, but limited by want of knowledge; their colouring was simply decorative.

The remains of Assyrian painting are much less abundant than those of Egyptian, though it appears from the evidence of travellers that the Assyrians must have painted extensively upon internal wall-surfaces covered with plaster, and also upon tiles built together so as to make more or less extensive compositions. The little that we know of Assyrian and Babylonian painting leads to the conclusion that it was technically not more advanced than that of Egypt, and resembled it in being a record and a decoration rather than an imitation of nature. Outlines were still strongly marked and adhered to, and spaces were coloured flatly, almost as we colour them in heraldic painting. The painting of those early times is, in principle, much the same as that now employed upon playing-cards.

The supreme position of Greece in the art of sculpture has strongly predisposed many critics in favour of her painters, and it has long been believed that if we could see their works we should admire them as we now admire Greek statues of the age of Pericles. There are, however, very good reasons for believing that Greek pictures,

even by the most famous men, would appear to us still primitive from the pictorial point of view, though it is certain that the drawing of the figures would be elegant and observant. We have no evidence whatever in the classical paintings which have come down to us that the ancients ever mastered the craft of painting in the modern sense—i.e. as an art which interprets truths of effect and which studies not only the *forms* but the *appearances* of nature. The great Greek painters must have been fine linear draughtsmen, and they would colour their drawings carefully; but all Greek art that is known to us has a clear and positive quality incompatible with the richness, the mystery, and the subtle visual truth of painting in its most advanced stages. With regard to the colouring of the Greeks, Sir Joshua Reynolds praised them for having used only four colours, and said that four are sufficient to make every combination required. Sir Joshua probably was thinking of flesh-colour only, which has since been painted by Etty with very few colours. MacIse said of Etty that 'with three colours and white—anything approaching to a yellow, a red, and a blue—he could produce a sweetly-coloured picture.' The Greeks in like manner might colour 'sweetly' with few pigments, but it is not possible to imitate the full colouring of the natural world without a complete palette. Apelles himself could not paint a primrose with yellow ochre, nor a geranium with red ochre, nor is there any means of mixing black and white so as to imitate the azure of a southern sky. It is therefore of the greatest interest to ascertain whether the Greeks had a complete palette or not. Here the difficulty is to know at what date each pigment came into use. The vague expression generally employed is that certain colours were 'known to the ancients.' Of yellows Pliny says that Polygnotus and Micon used yellow ochre only. Vermilion is said to have been 'first prepared by Kallias the Athenian five hundred years before the Christian era,' and minium (red lead) was first used by Nicias, a painter of Athens in the time of Alexander. It is highly probable that the Greeks would be acquainted with Egyptian colours, and the Egyptians knew the madder-root. The Tyrian purple and Egyptian blue were too famous for the Greeks to remain ignorant of them. Yellow and red orpiment were also known to the ancient world. Blue-black made from burnt wine lees was used by Polygnotus and Micon, and ivory black is said to have been employed by Apelles. As for vehicles, there is a well-known passage in Pliny which Sir Joshua Reynolds interpreted as a description of glazing, that is, repainting with transparent colours; but it seems more probable that such accounts as have come down to us mean really no more than varnishing. The use of the word 'atramentum' by Pliny seems to imply that the varnish darkened the picture, which it would do if it were not colourless. It is generally believed now that the works of the Greek painters were executed in distemper and varnished afterwards, except their encaustic pictures, tediously executed with melted colours. Distemper or tempera (the Italian word for the same thing) is a kind of painting in which opaque colours, ground in water, are mixed with any kind of thin glue or white or yolk of egg with vinegar. We believe that the Greeks possessed oils and varnishes, but there is no evidence that they ever practised what we call oil-painting. However, a tempera picture protected by a coat of oil-varnish is distinguishable from an oil-painting only by experts. As to their palette, the probability is that the extremely restricted list of pigments which has been attributed to them was a matter of choice rather than of necessity for con-

ventionally under-coloured work, or they may have begun their paintings with very few colours, as Titian did afterwards, and finished them with a fuller palette.

For a study of Roman painting our materials are much more abundant. We have no important works by famous artists, but there is an ample supply of such ordinary painting as was applied to the decoration of houses and tombs; and from this we may infer at least the technical condition of higher art. The variety of pigments was evidently sufficient to give a full scale of colouring by mixture or superposition, and, as oils and varnishes were known, it might have been possible for oil-painting to arise under the Cæsars. Everything was ready for it as everything was ready for printing, yet the final step was not taken. The art of tempera or size-painting remained technically much what it had been before, except that there may have been greater freedom in execution and in choice of subject. Classical taste in painting continued with a tradition of old methods for a considerable time after the introduction of Christianity, and even when the nude figure was no longer a subject of study tempera painting was still practised, though more stiffly than in classic times. The distance from the painters of Pompeii to mediæval work is marked by more than a technical decline.

In reading histories of painting we may be on our guard against the careless and inaccurate employment of the word 'fresco.' It really means painting on fresh plaster—i.e. on plaster that is still wet; but the word is inaccurately used for paintings on dry plaster also. The practice of painting on walls covered with plaster is as old as ancient Assyria, and it has been believed that the ancient Greeks understood true fresco, principally on the strength of an expression of Plutarch, *cph' hugreois zôgraphên*, 'to paint on a wet ground.' Vitruvius, too, speaks of a wet ground, and, although he does not directly say that it was painted upon *when wet*, he says that, so prepared, it was fit for pictures, and that colours on it are permanent. This permanence of the colours is the characteristic of true fresco. Unfortunately, Plutarch compares painting on the wet with encaustic as evanescence to permanence.

Whatever may be the real antiquity of true fresco, it is certainly a much older process than oil-painting. It was understood and practised in Italy in the middle ages, when mural painting in churches was already in great request. The process is as follows: On the second coat of ordinary mortar is spread a coat of fine old lime mixed with well-sifted river sand. In a few hours (say from three to six, according to temperature) this begins to dry, and the work of painting must be completed before the drying begins, consequently a small surface of plaster is laid at a time. All honest and conscientious fresco-painters, such as Antonio Veneziano, resisted the temptation to retouch on the dry plaster; but the careless or the incompetent could not resist, though such retouching is simply cheating, as it is really not in fresco, and not permanent.

The technical process of fresco was well understood in Italy whilst art itself was still in a primitive condition. Cimabue, Taddeo Gaddi, and Giotto, with many less known men, painted in fresco as well as in tempera, so that all the technical part of the craft was a matter of ancient tradition when Raphael and Michael Angelo took it up on their own account, and brought to it far greater powers of mind. To appreciate the progress made before these great men it is necessary only to refer to the stiff and mindless Byzantine art from which that of Cimabue was already a partial emancipation.

After the invention of oil-painting the inconveniences of fresco were more strongly felt, and many artists turned away from it to the new process. True fresco cannot be retouched; it has to be painted darker than the artist's intention, as it lightens in drying, and it must be painted from sketches or cartoons. On the other hand, it is luminous and has no gloss, and so is suitable for mural decoration. Raphael seems to have liked fresco and oil equally well. Michael Angelo greatly preferred fresco, as better suited to his powers. Leonardo da Vinci painted his great mural work, 'The Last Supper,' in oil, though fresco must have naturally suggested itself.

Many modern attempts to revive fresco have been made in Europe. They have rarely been successful, and have especially failed in the Houses of Parliament, where many works have decayed prematurely. Modern failures have led to the adoption of a process on dry plaster, fixed afterwards with water-glass in spray, as in Maclise's large works in the Royal Gallery; but this is not absolutely durable. The best substitute for true fresco appears to be Mr Gambier Parry's 'spirit fresco,' employed by Sir Frederick Leighton for his large compositions at South Kensington. These are painted with a spirit medium on dry mortar. In France a substitute for fresco has been found in painting on canvas with a dead surface, the canvas being afterwards fastened to the wall with white lead. True fresco may now be considered almost a dead art.

The next step of importance in the history of art is the discovery, or earliest known practice, of what we call 'oil-painting,' which includes the use of varnishes during the progress of the work. This has been generally assigned to John Van Eyck, who was born about 1390; but it is now believed that his elder brother Hubert may have an equal if not a better claim. Both certainly worked in the new method, and John continued it after his brother's death. Since then the practice of oil-painting and of varnish-painting has been carried without interruption down to our own time, and, though it has undergone much technical development, it remains essentially distinguished from tempera by the mixture of oil or varnish with the colours themselves and by the consequences in execution to which this mixture has led. The brothers Van Eyck themselves were far from anticipating the future freedom and power of oil-painting. Their work was beautifully executed in a smooth and simple way, and, with the exception of small cracks, it has lasted wonderfully; but their careful rendering of detail belongs to the infancy of art. An Italian student of painting, Antonello da Messina, stayed in Flanders for some time and worked under John Van Eyck. He afterwards returned to Italy by way of Venice, and from him the knowledge of the new method spread to Florence, and thence to the other cities of Italy. The date of Antonello's death, which occurred in Venice, is not precisely known, but appears to have been in the last years of the 15th century.

It may be convenient to remember that the year 1500 saw the practice of oil-painting firmly established in the north and south of Europe. It did not immediately win the absolute pre-eminence that it has subsequently attained. Michael Angelo expressed a contempt for it which was probably due to the fact that its full powers were not yet developed by his neighbours. The fame of Raphael as an artist is due to other qualities than the technical merit of his oil-painting, which remained comparatively primitive. The earliest practice of oil-painting was dependent upon the luminous quality of the ground showing through the colours; and, although the early oil-painters manifested a

workman-like skill in dealing with their materials, they displayed no power of handling. The manual precision of Albert Dürer has never been surpassed, yet his work as a painter is primitive. Roman painters of the time of Michael Angelo might use oil as a convenience, but they could have expressed themselves as completely in fresco or tempera. When we come to the Venetian school the case is very different. There was a harmony between the technical methods of oil and the genius of the Venetians which led to the highest technical excellence. Van Eyck and his followers, both in Flanders and Italy, painted upon a transparent monochrome. Titian used a substantial dead-colouring in which he could make whatever alterations he chose, and afterwards worked upon that by successive glazings till he obtained the utmost richness of quality. The notion that Titian had some secret that died with him may be dismissed as purely fanciful. His method of painting is well known, and his superiority to his imitators may be accounted for by his natural genius and by favourable circumstances. His master, Bellini, drew carefully and coloured well, but his work is still primitive, because it is still coloured drawing. In Titian's painting the different kinds of technical knowledge are so completely fused together that he is not the draughtsman who colours, but the painter. The same is true of Giorgione, almost equally gifted, but less favoured than Titian in the circumstances of his life.

Rubens was a great master of the *technique* of painting in another way. He painted much in transparent or semi-transparent colours over a first painting in transparent brown monochrome; but, instead of leaving the lights thin that the white ground might show through as in the practice of the early Flemish painters, Rubens loaded his lights with thick opaque colour. His way of painting was technically very systematic, which permitted an extreme rapidity. There is evidence that he followed the early practice of mixing varnish with his colours, at least when transparent and for linear sketching with the brush. The technical execution of Velasquez is a model of excellence in the use of both transparent and opaque colours and in variety of handling. It is not so methodical as that of Rubens, being always subordinated to the artistic intention of the painter.

The most perfect works on a small scale have hitherto been those of the Dutch painters, Teniers, Terburg, Metsu (or Matsys), Maas, Peter de Hooch, and many others of the same school. Their method of painting was almost universally to begin with a transparent brown monochrome on which they painted the shadows thinly, giving more substance and opacity to the lights. Being limited in their aims, and painting chiefly what they could see around them and study at their own convenience, they attained a high degree of technical excellence. Their drawing is almost invariably careful and true, and their colouring harmonious, whilst the quality of their textures is often inimitable.

The practice of modern artists is always founded upon that of one or other of the masters we have mentioned. There are not very many ways of painting, or if they seem to be many they are reducible to a few very simple principles. The early method of giving luminous quality to the lights by letting the white ground show through them is seldom followed in these days, but it has been resorted to occasionally. The practice of Rubens, by which the shadows are painted thinly and the lights more thickly, is much commoner in the modern schools. Reynolds, who painted first a strong dead-colour with few colours and glazed upon it afterwards, worked on the principle of Titian. Landseer's

practice was essentially that of the Flemish school, and Meissonier's (in his best works) that of the Dutch. Turner approached much more nearly to the Venetian practice than to that of Rubens, as he dead-coloured broadly and afterwards painted in detail on the dead-colour, using glazes and scumbles (opaque colour used thinly); but Turner's practice was complex, as he often had recourse to water-colour in his oil-pictures, and finally loaded his lights. Ingres, the leader of the classical French school, was a close follower of Raphael. It is difficult to point to any real technical originality in modern art, unless it be the use of thick pigments in the French school (called in French, *pleine pâte*) introduced by Decamps, and often exaggerated by his imitators. The novelty here was, however, rather in the brush-work than in the use of thick pigments themselves. Many French artists have also blurred their outlines in revolt against the clear definition of the classical school, but the originality was rather in the manner of doing it than in the mere softening of the outlines, as Titian, Correggio, Reynolds, and others had already carefully avoided the early hardness of definition.

Although the technical methods of oil-painting are few and have now been known for centuries, the varieties of *quality* which result from individual genius are almost as numerous as artists themselves. They cannot be explained without examples; but it may be said generally that, as different violinists elicit different qualities of tone from the same instrument, so the idiosyncrasy of painters produces new results with old colours and old processes. It is in this way, and not by the invention of novel methods, that the art continually renovates itself.

Oil-painting now holds the first place on account of its convenience, as it permits of infinite deliberation and alteration, and also on account of its great power and truth in imitating the textures and tones of nature. But the true successor of fresco in modern times is water-colour. It resembles fresco very closely by its rapidity and by the absence of gloss, though it cannot replace fresco in mural decoration. Water-colour, as a process, is much more ancient than oil, having been extensively employed in various ways during ancient and mediæval times; but the method of using it that gives the process its present intellectual value is essentially modern and English, dating from the early years of the 19th century. The practice of the 18th century led up to it by the use of broad washes in sepia or in neutral tint, afterwards more or less coloured, an adaptation of the Dutch and Flemish practice in oil-painting, except that the finished result stopped very far short of full colour. The water-colour of the present day has discarded the monochrome wash, beginning with pale washes in colour, and working from light to dark. In its perfection modern water-colour is distinguished by extreme freshness and brilliancy. It is important not only as an independent art, but by its great influence on modern oil-painting. The majority of oil-painters have themselves employed water-colour as an auxiliary for studies, especially in landscape, and much of the light and air in modern oil-painting may be attributed to its influence. Water-colour, in our own century, has proved a compensation for our failure in the attempted revival of fresco. Though apparently of inferior importance, because practised on a small scale, it has taught what fresco taught and more, as it has educated us in landscape. Improvements in the materials of water-colour have led some of its practitioners to attempt rivalry with the force of oil, which is unnecessary, as oil must ever remain the more powerful medium of the two, and water-colour has its own superiorities in freshness and delicacy. There does not

seem to be any probability that either of the two arts will ever be replaced by a new discovery as tempera was superseded by oil, nor is it likely that the technical methods will be improved. There is room for improvement in a stricter abstinence from the use of evanescent or destructive colours; but unfortunately very few artists trouble themselves to secure the permanence of their works.

Water-colour was despised in France until the fall of the second empire; but the example of English artists has led the French to the study of it, and now many of them pursue it with success. Their methods of work are usually very simple and direct, and their influence is almost exclusively in favour of freshness and decision.

(2) *The Intellectual History of Painting.*—Under the Egyptian dynasties painters were recorders of events and decorators; in Assyria they illuminated a sort of pictorial history of royal deeds. In both these cases there could be very little room for the exercise of individual intellect in the artist, who was seldom more than a manual workman, laying on colour according to methods prescribed for him by authority. Even in Greece we have evidence that the manual skill of artists was despised as handicraft by the class of gentlemen and scholars; however, Greek painters of eminence attained individual distinction, and such a complete degree of personal emancipation that they were free to exercise whatever intellectual power they possessed. There is not much expression in Greek sculpture, but there is some, and what there is proves quite sufficiently that the subtle and acute intellect of Greece could express itself in art as effectually as in literature. What remains to us of Greek and Roman caricature is good evidence of faculties that might have exercised themselves, by an alliance with a higher form of art, in what we now call genre-painting. Still, we have no direct proof that the fine arts in Greece ever really were intellectually so great as her poetry, her philosophy, and her drama. In the decline of classical art we find little more than the current production of an inferior class of men for the adornment of habitations or tombs. The beginnings of Christian art, stiff in design and laboriously ornamental, give hardly any evidence of intellect; the artists who produced that art were in a condition of mental servitude, like that of the men who now manufacture holy icons in Russia, and who are the direct descendants of the early Byzantine school. As the fine arts became gradually emancipated from the thralldom of sacerdotal authority intellectual power began to show itself, and, at length, when the human mind was stimulated in so many directions by the great outburst of the Renaissance, the art of painting had its full share in the general activity, and assumed a place by the side of literature which it has ever since maintained. Nevertheless, the necessity for high manual accomplishment and technical mastery must always, in painting, give an advantage to the workman over the thinker; and so we find, as in many Dutch pictures, that clever representations of the most commonplace subjects preserve their value though almost destitute of mind. There can be no more striking contrast than that between a Dutchman toiling for six weeks on the representation of a besom and Michael Angelo painting a prophet in half a day; yet the Dutchman is immortal too. The intellectual progress of art has been marked by the extension of its sympathies. Under Christianity the art of painting began again from the beginning, without either technical or intellectual preparation. Its first awakening of sympathy is with the human side of Christianity, the love of mother and child, the sufferings of the crucified Christ, the sorrow and bereavement of the disciples. As religious art

advances, its mental progress is shown by the increasing importance given to the human side of its subjects and the diminution of ornament in dress, till at length the dresses become simple draperies, almost without jewels or embroidery, and the charm of the work lies in the beauty or nobility of the faces and the dignity of the attitudes. With the Italian Renaissance the art of painting made a great intellectual advance by its sympathy with what was then the new activity of scholarship. Raphael was, if not himself a scholar, the intimate friend of scholars, working constantly under their influence; besides which he was an architect and an archaeologist. The selection of 'The School of Athens' as the subject of one of the most important mural pictures in the Vatican is most significant. In Leonardo da Vinci the artistic is united to the scientific intellect; in Rubens it is united to the broad culture of the scholar and the man of the world. Rembrandt may not have been a learned man, but few authors or artists have shown more sympathy with different classes, or have discerned so well the dignity that may belong to the learned or the unlearned, to the rich or the poor. The pictures and etchings of biblical subjects by Rembrandt bring them nearer to us by their homely truth than the ideal conceptions of Raphael. Surely we cannot refuse the title 'intellectual' to an art which contains a philosophy at once so comprehensive and so ripe. The faculties of Teniers and Ostade are narrower and lower, yet even in their works there is a sympathy with the humbler classes which has lasted down to the art of our own day, which was lively in the art of Wilkie, and is graver and more profound in the work of Israels.

All portrait-painting of any importance has endeavoured not only to copy the features, but to express as much as possible of the mind; and the knowledge we derive from historians and biographers is felt to be incomplete until we have referred to the canvases of some observant contemporary artist, some Holbein, Van Dyck, Velasquez, Reynolds, or Raeburn. Even in these days of photographic invention the portrait-painter keeps his place, great portraits are painted still, and future students of history will not be satisfied with the photograph alone, but will go for the intellectual element to the canvases of a Millais or a Bonnat. Closely connected with portraiture is the art which observes and records the passing phases of social life, an art which reached perfection in the 18th century in the strongly characterised and too truthful pictures of Hogarth. The representation of contemporary life, in drawing-rooms and elsewhere, has been actively pursued down to our own day in all the leading schools of Europe, and is now practised more than ever, especially in France, where the artists are tempted by the elegance of modern interiors and the grace of feminine costumes.

In the 19th century there has also been much retrospective painting, particularly of the 18th century, and this has led to a very close and minute study of that century by Leslie in England, Meissonier and Gérôme in France, and many other artists of ability. The retrospective tendency of our own time has been strongly manifested in other ways. The modern interest in the past has been shown by much 'historical' painting on insufficient data representing personages whose portraits we do not possess, in buildings that have left no trace, and engaged in actions known to us only by the meagre narrative of some chronicler. Art of this kind possesses no real historical interest, though it may display considerable artistic ability. Of late years it has been in a great measure superseded by archaeological painting, skilfully practised

by Mr Alma Tadema and his followers, whose object is to revive the past for us in its details as it really was by representing everyday life without much pretence to the portraiture of individuals or the recording of particular events. This kind of painting has brought the art nearer than ever to the spirit of scholarship. No doubt the special interest of it is outside of artistic interest, but there is no reason why archaeological pictures should not be as beautifully drawn, as well composed, and as richly coloured as any others.

A sketch of the history of painting would not be complete without some notice of the way in which landscape became a speciality. Rude and childish landscape backgrounds are found even in Assyrian art, they are not uncommon in Greek and Roman antiquity, and they attained a considerable degree of freedom and observation in the backgrounds of the paintings at Pompeii. After the death of classic art, painting began again from its first rudiments in the ornamental art of the middle ages, and the study of landscape soon revived in the backgrounds of religious pictures. Mediæval landscape lasted down to Raphael, who was himself essentially a mediæval landscape-painter, especially in his early works. The general characteristics of that kind of landscape are clear atmosphere, pure skies, either cloudless or with a few white clouds, pale blue distances with hills, green foregrounds, and almost invariably one or more well-kept buildings. Trees in the foreground are usually slender, with thin twigs and few leaves visible almost separately against the sky; in the distance they may be more massive. Water is usually calm in ponds or winding rivers, or serene in distant sea. Rocks occur in mediæval landscape, but are seldom accurately represented, the mediæval ignorance of rocks having even persisted in Leonardo da Vinci notwithstanding his scientific genius. In the backgrounds of Albert Dürer all kinds of objects are observed and set down as in a catalogue; he perceived the grandeur of mountains, the abundance of forest trees, the picturesque beauty of mediæval towns, and he took an interest in all the details of the foreground; but he never fused his details into one connected whole; he never saw nature with the eye of a landscape-painter; he had no sense of atmosphere or effect. The beginning of the modern landscape spirit is to be sought for in Venice. Titian made many studies of landscape, and, although in his pen-drawings there is no recognition of local colour and very little effect, there is a remarkable sense of grandeur and a fine grasp of noble scenery, not in detail merely, but as a whole. In his painted landscape backgrounds Titian goes still further and attempts transient effects, showing himself a true precursor of the modern landscape-painters. Tintoretto occasionally exercised his magnificent powers in the same direction. The most influential of professed landscape-painters was Claude. He had not the power of the Venetians, but he had a tenderness and charm, and a sense of grace and beauty, that won the hearts of contemporaries and have since maintained the celebrity of his name, though it is easy for criticism to point out deficiencies of knowledge. Unlike Dürer, Claude saw nature, not in details, but synthetically in complete pictures full of atmosphere and light. Salvator Rosa and Gaspard Dughet (or Poussin) maintained a grandeur of conception and style in landscape which, in spite of a certain remoteness from pure nature, tell effectually in picture-galleries even at the present day.

The same may be said of Gainsborough, whilst Wilson perpetuated in England a feeling for landscape akin to the amenity of Claude. Cozens and Girtin had the old breadth and serenity of conception, with a more modern view of nature, and

Turner did not manifest much personal independence until he had first studied and imitated the old masters, particularly Claude. Indeed, he is much more closely connected with the past than with the future of landscape-painting. He had the deepest respect for the older masters, whom he both studied and imitated, yet he founded no school and has had little influence on the art of England and none on that of continental Europe. Constable, on the other hand, who during his lifetime was a less celebrated artist, has had a very far-reaching influence. The freshness and originality of his view of nature, less poetical and imaginative than Turner's, but nearer to rustic reality, determined the future direction of that French rustic school which in its turn has influenced all the schools of Europe. Whilst England has had her poet landscape-painter in Turner, France has had hers in Corot, a painter of at least equal celebrity, though of much narrower range. Like Turner, Corot founded his art on the study of Claude, but won public favour late in life by a delicacy of sentiment which was his own. His subjects were simple and his effects chosen so as to avoid strong colouring, but he composed beautifully and was a master of quiet grays, pale yellows, and browns.

Since the middle of the 19th century landscape-painting, both in oil and water-colour, has been actively pursued all over Europe. Every class of scenery has found its interpreters. Scotland has been painted effectively by Horatio MacCulloch, Sam Bough, Mr Peter Graham, Mr Colin Hunter, and many others. A severely accurate and scientific spirit was imported into English landscape by Mr Cooke and Mr Brett. The French landscape of the present day is usually marked by simplicity of subject, breadth of treatment, and truth of tone, without much accuracy of detail. Marine painters in all countries appear to concentrate their attention more than their predecessors upon the sea itself, and both English, French, and American artists have produced remarkable studies of waves.

A sketch of the history of painting seems to require a brief outline of the sects which have divided artists. The chief of these have been the Classics, the Romantics, the Realists, the Pre-Raphaelites, and the Impressionists. The classical aim was the pursuit of the ideal, which was believed to be *one* and to have been attained by Raphael; this school was represented by the French painter Ingres. The Romantics desired freedom from the classical restraint, and liberty to illustrate all literature and all history that interested them in their own way; their great man was Eugène Delacroix. The doctrine of the Realists is the right to represent persons and things as they are without beautifying them by idealisation. This doctrine was at one time represented by the French painter Courbet; but, in fact, there was a great deal of downright realism long before his time, as we find it in Velasquez, Rembrandt, Teniers, Ostade, Hogarth, and many others, who have redeemed the ugliness of a subject by the intelligence of their treatment and the force of their execution. Even in the case of Courbet himself we now easily see that, although he affected to take nature exactly as it is, he displayed the wilfulness and the style of an artist. English Pre-Raphaelitism was not alone in its return to the painstaking imitation of detail which marked the practice of Raphael's predecessors. Like the continental movements in the same direction, it was a return to patient analysis, and had a disciplinary value; but the accumulation of artistic experience was too much for it. After Titian, Velasquez, and Reynolds, it is not possible to bind down the art of painting permanently to the minute practice of the early masters. Intellectually the movement

was of more importance, as it favoured the choice of noble subjects. Impressionism asserts the importance of visual truth as opposed to mere truth of fact, and affirms that painting ought not to represent what *is*, but what *appears*. Impressionism is also opposed to the abstract rendering of this or that quality; it requires a synthesis of all visible qualities as they strike the eye together. The Impressionists claim several great artists, especially Turner and Constable, as their predecessors. They are equally opposed to the detail of the minute painters and to the hard, clear, linear definition of the classical schools. There can be no doubt that theoretically they have right on their side, but in practice their art is often unsatisfactory, as it requires the happiest and most rapid sketching to be successful, with great certainty in selection and perfect truth of tone.

The present state of the art of painting is one of complete freedom from all the former restraints of religious or classical authority. The fine arts are as free as the sciences, and, although less exclusively devoted than men of science to the pursuit of natural truth, contemporary painters at least refer to nature for everything. The consequence is a pervading freshness in the modern schools, and it is also certain that manual skill has never been so general as it is now. On the other hand, the intensity of the commercial struggle amongst the great multitude of artists is certainly not favourable either to learning or to refinement, and it is doubtful whether painting makes any advance in taste and culture corresponding to the increase of its productiveness or the extension of its fields of study.

Chronology.—The extent of the subject renders laconic treatment necessary. Archaic Greek drawing, marked by want of proportion, especially in thickness of limbs, lasts in vase-painting throughout the 6th century B.C. and later. In 5th century better drawing on many vases; in 4th century it is often learned and beautiful, as on Camirus vase (British Museum), contemporary with Protogenes. Attitudes then easy and graceful, faces shown in all positions; 5th and 4th centuries B.C. golden age of antique painting, including Apollodorus, Zeuxis, Parrhasius, Apelles, Polygnotus, and Micon. Romans imported Greek pictures and took up painting by imitation. Roman painter Ludius (Augustan age) anticipated Claude in choice of subjects. Paintings preserved at Herculaneum and Pompeii, and in baths of Titus, belong nearly to Christian era, some earlier, others a few years later. Pompeian painting shows interest in ordinary life and in landscape. Classical art is, in feeling and principle, prolonged for six centuries in the service of Christianity.

The middle ages are divided by Woltmann into (1) Early, from 700 to 950 A.D.; (2) Romanesque, from 950 to 1250 A.D.; (3) Gothic, from 1250 to 1400 A.D. Thus the three periods are 250, 300, and 150 years. Throughout these ages, speaking generally, the human motive of art is religious, and its artistic motive is ornament. In the middle ages figure design began again from a barbarous infancy, it being necessary for the representation of religious personages. From 8th to 13th century childish drawing and gaudy colouring prevailed throughout Europe. In 13th some partial improvement takes place, and in 14th the advance is remarkable when Claes Sluter carved his life-like statues. Brothers Van Eyck (q.v.) born in this century.

The 15th century is the time of transition from the art of the middle ages to an improved craft of drawing and painting preparatory to the Renaissance. Improvement simultaneous in Flanders and Italy. Van Eyck's work known in southern Europe, his influence only technical, and soon died out in Flanders itself. Roger van der Weyden

(died 1464) worked differently, having stayed in Italy and exercised much influence in Flanders and Germany. His pupil, Hans Memling, died 1495.

The 16th century is remarkable for its extension of the subject-matter of painting. Before 1500 the art is chiefly confined to religious subjects and portraits, afterwards it includes more of what we now call genre—a change associated with the name of Quentin Massys (1466–1530). The nude introduced into Flemish art from Italy by Jan Gossart (died 1532). After this date Flemish painters went much to Italy, which produced a hybrid school called the 'Italianised Flemings'—e.g. Michael Coxis (1490–1592), spent many years in Italy. The first Flemish school, now at an end, was influential in Germany; Roger van der Weyden had German pupils. Cologne and Nuremberg were active centres. Martin Schongauer lived in Rhineland in the 15th century. Hans Holbein the elder, of Augsburg, lived in 15th and 16th centuries. His famous son, Hans (1498–1543), represents the perfection of German realism in portrait. Albert Dürer (1471–1528) stands for Germany, coming out of, but not yet delivered from, the middle ages. His contemporary, Lucas Cranach (1472–1553), was like Dürer, laborious and productive. Dürer visited Venice 1506, and was admired for his skill (particularly by Giovanni Bellini), but had little influence. German hardness and minuteness of finish culminated in the comparatively mindless art of Denner (1685–1747).

Italian painting is minutely divided into local schools, and these again chronologically into three or four stages of development. Masters of 14th century divided into Tuscans, Siennese, Bolognese, Paduan, and Neapolitan; those of the 15th into Tuscan, Umbrian, Paduan, Veronese, Milanese, Venetian; those of the 16th are headed by the well-known great individualities. The schools affect each other—e.g. it is difficult to disengage Roman and Florentine art, whilst the Umbrian school gave strength to Rome. The following list gives the most famous names.

14th Century—Tuscans.—Giotto (1276–1336), Taddeo Gaddi (1300–66), Orcagna (died before 1376). *Siennese.*—Duccio (still living in 1339), Angelico (1387–1455).

15th Century—Tuscans.—Paolo Uccello (c. 1400–79), Masaccio (1402–28), Filippo Lippi (1412–69), Ghirlandajo (1449–98). *Umbrians.*—Pietro della Francesca (living 1494), Giovanni Santi (died 1594), Pietro Perugino (1446–1524). *Bolognese.*—Francis (1450–1517). *Paduans.*—Andrea Mantegna (1431–1506). *Venetians.*—Antonello da Messina (1414–93), Gentile Bellini (1421–1507), Giovanni Bellini (1426–1516).

16th Century—The Great Masters.—Leonardo da Vinci (1452–1519), Michael Angelo (1475–1563), Raphael (1483–1520), Correggio (1494–1534), Giorgione (1478–1511), Titian (1477–1576), Tintoret (1512–94), Paul Veronese (1530–88). Other Italians of eminent, but not of supreme, rank in the 16th century are Luini (living 1500–30), Volterra (1509–66), Andrea del Sarto (1488–1530), Sebastiano del Piombo (c. 1485–1547), Palma Vecchio (c. 1480–1528), Moroni (c. 1525–78).

In the north of Europe there was a new development occupying the 17th century. In the year 1600 Rubens was an accomplished artist (died 1640). Snyder (1579–1637) his most powerful contemporary, and Van Dyck (1599–1641) his most eminent scholar. David Teniers, the father (1582–1649), was eclipsed by David Teniers, the son (1610–94); the latter gave genre-painting a firm position. Gonzales Coques (1614–84) was a portrait-painter. Passing to Holland we find Frans Hals, a contemporary of the elder Teniers (1584–1666), and a painter of remarkable certainty and spirit. The greatest of the Dutchmen, Rem-

brandt, belonged entirely to the 17th century (1607–69). The fame of Rembrandt has greatly increased during the 19th century, and so has that of Frans Hals. Rembrandt had distinguished pupils, like Dow and Flinck, and he influenced many artists. Terburg, genre-painter, was Rembrandt's contemporary (1608–81), also Metsu (1615–58). These carried genre-painting to perfection. Landscape also prospered in Rembrandt's time, chief representatives being Ruysdael (c. 1628–82) and Hobbema.

In Spain a primitive school was founded as early as 1450. In the 16th century local schools developed themselves. Eminent foreign artists visited Spain and worked there, as in England. Of the Spaniards themselves, few have become celebrated out of their own country. Ford's list includes only thirty-seven names; the National Gallery only seven, and of these one was a Greek. Only five Spanish artists are represented in the Louvre. The fame of the school is due almost entirely to Velasquez (1599–1660) and Murillo (1616–82). Next to these come Zurbaran (1598–1662) and Ribera (1588–1656); Morales (c. 1509–86) is also known. Goya (1746–1828) is the only great Spanish artist between the old masters and our contemporaries.

The French school before developing a character decidedly of its own was subject to foreign, chiefly Italian influences, especially after the Renaissance. François Clouet (c. 1500–72), one of the earliest French masters, was naturalised, and probably of Flemish origin, like his accurate method of work; Jean Cousin (1500–89) worked under Italian influence; Vouet (1590–1649) studied, lived, and married in Italy; the great Poussin (1594–1665) lived nearly forty years in Rome, and died there; Claude le Lorrain (1600–82) lived fifty-five years in Rome, where he, too, died; Lesueur (1617–55) refused to go to Rome, but was influenced by Raphael; Le Brun (1619–90) studied four years in Rome, like other eminent Frenchmen since his time. The following artists are essentially French: Rigaud (1659–1743), Watteau (1684–1721), Lancret (1690–1743), Chardin (1699–1779), Boucher (1704–70), Greuze (1725–1805), Fragonard (1732–1806), Prud'hon (1758–1823).

In the British school the seven names which follow are at the same time distinctly national, and generally recognised by continental criticism. They occupy in this respect a position similar to that of the few Spanish masters who are generally known: Hogarth (1697–1764), Reynolds (1723–92), Gainsborough (1727–88), Turner (1775–1851), Constable (1776–1837), Wilkie (1785–1841), Landseer (1802–73).

The peculiarity of the present situation is that all schools have turned away from their national ancestry. The modern Italians go straight to nature, and paint it as if they had no art behind them. The modern Dutch have no connection with the great Dutchmen of the 17th century. Spaniards of the school of Fortuny are as remote as Americans from Velasquez. French landscape has nothing to do with Claude. Leighton is not a descendant of Reynolds. We find everywhere that the national artistic ancestry counts for little or nothing. The localisation of styles has to be done anew by criticism for the close of the 19th century, and it is complicated by the free choice everywhere made amongst past examples. Ribot is nearer to Ribera than to any Frenchman. Paris has become the capital of the art of painting. The clever and promising American school is as yet an offshoot from the French; and the northern European nations send their art-students to Paris as once they went to Rome. Schools are no longer national, the art has become cosmopolitan to a degree impossible for literature.

Technical Chronology.—400 B.C., white-lead of this date has been found at Athens; 1398 A.D., Indian ink prepared in China as now; 1350-1400, true fresco used in Italy; 1500, oil-painting generally adopted; 1710, Prussian blue discovered by Diesbach of Berlin; 1787, zinc white suggested by Courtois of Dijon; 1802, Thénard discovers cobalt blue; 1814, discovery of emerald green; 1814, first discovery of existence of artificial ultramarine, and prize offered for its manufacture soon afterwards won by Guimet of Lyons; 1814, cappagh brown found on Lord Audley's estate; 1817, cadmium discovered by Stromeyer; 1834, zinc white prepared by Winsor and Newton as Chinese white; 1838, discovery of chromium green by Pannetier and Binet; 1850, water-glass painting introduced. Of the ten colours chosen for permanence in Professor Church's restricted palette six have been discovered during the 19th century.

See further the articles in this work on the several painters; also ART, FRESCO, IMPRESSIONISM, RENAISSANCE, ROMAN-ISM, &c.

Paisiello, GIOVANNI (1741-1816), a Neapolitan composer, whose best-known work is the charming opera *Il Barbiere di Siviglia* (not to be confounded with Rossini's). Besides more than ninety operas, Paisiello composed over a hundred masses, requiems, cantatas, and numerous instrumental pieces.

Paisley, a busy manufacturing town of Renfrewshire, stands, backed by the Braes of Gleniffer (749 feet), on the White Cart, 3 miles above its influx to the Clyde, 7 WSW. of Glasgow and 16 ESE. of Greenock. Although commonly identified with the *Vanduarra* or *Vindogara* of Ptolemy, which Skene places rather at Loudoun Hill in Ayrshire, it first is heard of certainly about 1157 as *Passeleth*, a possession of Walter Fitzalan, the first Scottish ancestor of the royal Stewarts (q.v.). He six years later founded here a Clugniac priory, which was dedicated to SS. James, Mirin, and Milburga, and which in 1219 was raised to the rank of an abbey. It was burned by the English in 1307; suffered much at the Reformation in 1561, and still more by subsequent vandalism; and now is represented chiefly by the aisled Decorated nave (15th century: the Abbey parish church, restored since 1862), and by the chapel of St Mirin, called the 'Sounding Aisle' (1499), with the altar-tomb of Marjory Bruce. Near the abbey are statues of Wilson the ornithologist and Tannahill, who, like Professor Wilson ('Christopher North'), were natives of Paisley. There are also fine statues of George A. Clark, founder of the town-hall, and (since 1891) of Sir Peter and Thomas Coats. Mother-well and Alexander Smith were residents; and the

latter describes the town well in *Alfred Hagart's Household*. Elderslie, 2 miles W., is the traditional birthplace of Wallace.

The public edifices include the municipal (formerly county) buildings (1818); new sheriff court-house (1885); the fine Clark town-hall, Italian in style, and built in 1879-82 at a cost of £110,000; the new county buildings (1891), containing one of the finest council halls in Scotland; the Coats free library and museum (1871), with a picture-gallery and an observatory; the grammar-school (1576; rebuilt 1864); and the Neilson educational institution (1852). The Coats Memorial Baptist Church (1891) is, it is claimed, the finest ecclesiastical edifice built in Scotland since the Reformation, having cost £100,000. The Fountain Gardens (1868), the Brodie Park (1877), and St James's Park, round which is the racecourse, have an area respectively of 6, 22, and 40 acres.

The linen, lawn, and silk-gauze industries, important during the 18th century, are now extinct; as, too, are the 'Paisley shawls,' so celebrated between 1805, and the middle of the century, their sale sometimes exceeding £1,000,000 per annum. The manufacture of linen sewing-thread, introduced in 1722 by the witch-denouncer Christian Shaw of Bargarran, has been nearly superseded since 1812 by that of cotton thread, which has assumed gigantic proportions, the two principal firms now employing about 10,000 hands between them. There are also works for dyeing, bleaching, tartans, woollen shawls, carpets, distilling and brewing, chemicals, starch, corn-flour, preserves, engineering, &c., besides shipbuilding-yards. The Cart since 1786 has been rendered navigable, its water-way being finally deepened to 18 feet in 1888-90; and water-works (1834-90) furnish 6,000,000 gallons per diem to Paisley and Johnstone. Paisley was made a free burgh of barony in 1488, the fourth centenary of that event in 1888 being graced by the presence of Queen Victoria, who afterwards placed a memorial of the Stewarts in the ruined choir of the abbey. Since 1833 it has returned one member to parliament. In 1843 the corporation had to suspend payment, nor was the burgh clear of debt until 1877. Pop. (1801) 24,324; (1841) 48,125; (1881) 55,627; (1891) 64,379.

See Cosmo Innes' *Registrium Monasterii de Passelet* (Maitland Club, 1832), two works by Semple (1872-74), Dr Cameron Lees' *Abbey of Paisley* (1878), and Robert Brown's *History of Paisley* (2 vols. 1886).

Pakhoi, a seaport of China, opened to foreign trade in 1876, stands on the northern shore of the Gulf of Tonking. The harbour is shallow. Trade does not flourish. The imports—cottons, woollens, opium, rice—average £809,700 per annum; the exports—tin, sugar, indigo, aniseed, hides, ground-nut oil—£229,700. Pop. 25,000.

Palacky, FRANCIS, a Bohemian historian, was born 14th June 1798, at Hodoslavitz, in Moravia, and studied at Presburg and Vienna. In 1829 he was appointed historiographer of Bohemia, and was charged to write a *History of the Bohemian People to 1526* (5 vols. 1836-67), which appeared in both German and Bohemian; it is one of the greatest literary works in the Bohemian tongue, and nationalist through and through. Palacky took part in the political agitation of 1848, and was the leader of the Slav or national party as opposed to the German at the Diet of the Kremsier. Besides his great *History* he published works dealing with the Hussite period, and with Schafarik edited *The Oldest Memorials of the Bohemian Language* (1840). He died 26th June 1876 at Prague.

Palæography is the science which deals with ancient manuscripts, teaching us not only to

decipher them, but to judge of their date, genuineness, and place of origin. While Epigraphy (see the article INSCRIPTIONS) is concerned with writings engraved on some hard substance, such as stone or metal, the materials for palæographic study comprise ancient books, either rolls, *volumina*, written on leather or papyrus, or *codices*, written in book form on sheets of vellum or paper. Wax-tablets, charters, bulls, decrees, acts, business papers, and similar documents have also to be considered by the student of palæography.

The oldest extant manuscripts come from Egyptian tombs, and are written on sheets of Papyrus (q.v.), prepared from the pith of a rush. A few fragments date from the time of the early empire, the most important being the *Papyrus Priese*, the oldest book in the world, which was found in a tomb of the 11th dynasty, and must therefore be older by several centuries than the Hebrew Exodus. Coming down to the 18th and 19th dynasties, papyrus rolls, usually containing portions of the Book of the Dead (q.v.), are numerous. But documents written on papyrus, a very fragile material, have mostly perished, and the chief ancient MSS. which have come down to us are written either on parchment, which is still used for legal documents, or on vellum; the skins being prepared so as to be written on both sides, thus superseding the older leather rolls, still used in Jewish synagogues for copies of the Law. The necessary limits of this article make it impossible to discuss the hieratic and demotic papyri from Egyptian tombs, or any of the Eastern scripts, Chinese, Pali, Indian, Coptic, Syriac, Hebrew, or even the magnificent specimens of Persian and Arabic calligraphy preserved in oriental libraries. The student may, however, be referred to the oriental series of the Palæographical Society, to Silvestre's *Paléographie Universelle*, and Burnell's *Elements of South Indian Palæo-*

graphy. It must here suffice to describe briefly the Greek and Latin style, and the more important of the mediæval scripts.

Both in Greek and Latin manuscripts we find two contemporaneous but widely-different styles of writing; a book-hand, formal and stiff, but legible, used by professional scribes, and a cursive hand, rapid, careless, loose, and straggling, often very difficult to read, which was employed for private correspondence, contracts, accounts, and, somewhat formalised, for charters, rescripts, and other official documents.

The book-hands may be classed as Capital, Uncial, or Minuscule. The capitals, which differ little from the lapidary forms used in inscriptions, are square and angular, such as are still retained for initials, titles, and superscriptions. Manuscripts written wholly in capitals are very rare, the use of more facile materials, such as parchment or papyrus, having led at a very early time to modifications of the lapidary forms, transforming them into uncials, a formal book-hand, large, clear, and legible, used by professional scribes for codices, and derived from the capitals with little change, save that the forms are more rounded, and often inclined rather than upright. Thus, **Ε** both in Greek and Latin is a characteristic uncial form, obtained by rounding the capital form **E**, and saving labour by requiring only two strokes of the pen instead of four. The term Uncial is as old as the time of St Jerome, but its modern usage is due to a misconception, uncial letters being seldom an inch in height, as the name implies. The general resemblance in the character of Greek and Latin uncials will be seen by a few words from St John, xxi. 19, as they appear in the *Codex Bezae* at Cambridge, a manuscript assigned to the 6th century, containing the Gospels and Acts in Greek, with the Vulgate translation.

CHMENΩNTI OIΩΘANATΩ ΔΟΞΑ CEITONΘN

Greek.

SIGNIFICANSQUA MORTE HONORIFICABITDM

Latin.

Or, in ordinary minuscules, σημεῖων [σημαίων] πωρ θανατῷ δοῦσαι τον Θεον, 'significans qua morte honorificabit Deum.'

In the 8th and 9th centuries a new book-hand was evolved mainly out of the cursive, but incorporating sundry forms from the degenerate contemporary uncial. This, by reason of the smaller size of the letters, is called minuscule. The old majuscule cursive, developed out of the capitals and uncials, which had by this time become formless and illegible, was gradually superseded by a new cursive, developed out of the minuscule. The minuscule reached its perfection as a book-hand in the 11th century, after which it continually degenerated till the invention of printing. Both for Greek and Latin books the early printers adopted at first the corrupted forms of the contemporary book-hands, but afterwards returned to the older and purer types of the 11th and 12th centuries. Thus there is a general analogy between the successive stages of Greek and Latin writing. Side by side with the old cursive scripts there is a gradual evolution of improved uncial book-hands till about the 4th century, followed by a period of decay, till the 9th century, when the revival of learning produced a regeneration, again followed by progressive deterioration till the invention of printing caused a reversion to the best of all preceding styles, that of the 11th century. Traces of these revolutions may

still be recognised. It will be observed that we now employ four different alphabets: minuscules for our printed books, and capitals for their title-pages, headings, and initials, and cursives for our correspondence, while the initials in our ordinary writing are analogous to uncials. Familiarity prevents us from noting the wide differences in the forms of such letters as A, a, α; B, b, β; G, g, γ; or R, r, ρ. These are survivals, the first from the lapidary capitals of the Augustan age, the second from the French book-hand of the 11th century, and the third from the Tudor cursive, modified and improved by the Italian cursive of the Elizabethan age.

Greek Palæography.—No Greek manuscripts written in pure capitals have come down to us, though the transitional forms may be detected. The oldest Greek manuscripts now extant are papyri in early uncials of the Ptolemaic period which have been found in Egypt, their preservation being due to the dryness of the climate, and to the practice of burying documents in tombs. Three must be earlier than 180 B.C., and there are several Homeric fragments on papyri earlier than the Christian era. The most important contain Orations of Hyperides, of which the oldest are assigned to the 1st century B.C. We have from Herculaneum an ancient library consisting of 1803 papyrus rolls, which must be older than 79 A.D.,

when the city was destroyed. These early Greek uncials being written on papyrus, a fragile material, are slender and delicate, without bold curves, thick downstrokes, or fine hairlines, which only became possible when the use of vellum introduced a firmer and bolder style. In these uncial papyri the introduction of ligatures produced a tendency to cursive forms, which are exhibited in the *ostraca*, of which great numbers have been found in Egypt. These are usually receipts for taxes, scratched with a point or written with ink on potsherds. Our chief knowledge of the early Greek cursive is derived from the private papers and correspondence of Ptolemy, son of Glaucias, a Macedonian Greek, who lived as a recluse at the Serapeum about 170 B.C. Cursive scripts were, however, used by the Greeks at a much earlier period; Greek inscriptions in the Cypriote syllabary exhibiting forms of a distinctively cursive character as early as the 7th century B.C. Compared with the papyri the uncial vellum codices, of which about 300 are known, exhibit a firmer and more set uncial style, which was rendered possible by the material. The oldest to which a definite date can be assigned is the Dioscorides now at Vienna, which from internal evidence must have been written about 506 A.D. Earlier, but undated, are the three great Biblical codices, the *Codex Vaticanus* at Rome, which is assigned to the 4th century; the *Codex Sinaiticus* at St Petersburg, assigned to the end of the 4th or the beginning of the 5th century; and the *Codex Alexandrinus*, now in the British Museum, which probably belongs to the middle of the 5th. The style of the writing in these uncial codices is seen in the subjoined specimen, which is taken from the Septuagint version of Esther, i. 22, as it appears in the *Codex Sinaiticus*.

ΚΑΙ ΑΠΕΣΤΙΛΕΝ ΕΙΣ Ὁ ΒΑΣΙΛΕΥΣ
ΠΑΣΑΝ ΤΗΝ ΒΑΣΙ
ΛΕΙΑΝ ΚΑΤΑ ΧΩΡΑΝ
ΚΑΤΑ ΤΗΝ ΛΕΞΙΝΑΙ
ΤΩΝ ὩΣΤΕ ΕΙΝΑΙ
ΦΟΒΟΝ ΑΥΤΟΙΣ ΕΝ
ΤΑΙΣ ΟΙΚΙΑΣ ΑΥΤῶΝ.

This in ordinary Greek type would read :

καὶ ἀπέστειλεν εἰς
πασάν τὴν βασι
λεῖαν κατὰ χώραν
κατὰ τὴν λέξιν αὐ
τῶν ὥστε εἶναι
φοβὸν αὐτοῖς ἐν
ταῖς οἰκίαις αὐτῶν.]

To the 5th century are assigned the palimpsest *Codex Ephraemi* at Paris, to the 6th the *Codex Bezae* at Cambridge and the *Codex Claromontanus* at Paris. After the 7th century the Greek uncial loses its early style; the letters become oval, narrow, elongated, and cramped, sloping to the right; accents make their appearance, and the pure early uncial degenerates into cursive forms difficult to read.

At the end of the 6th century we find the first beginnings of the new minuscule, the book-hand of the future, which was destined to replace both

the deformed uncial and the earlier cursive, from each of which it borrowed certain elements. The earliest trace of these minuscule forms as yet discovered are seen in a collection of papyri, ranging in date from 592 to 616 A.D., which were the business and family papers of Aurelius Pachymius, a dealer in purple dyes. The transition from the old to the new style is exemplified in a most interesting sheet of papyrus from Ravenna, now at Vienna, which contains the signatures of certain bishops to the Acts of the Council of Constantinople, held in 680. The older bishops sign in slanting uncials and the younger men in early forms of the new minuscule. In the 9th century, with the revival of learning, this new minuscule developed into a calligraphic book-hand, which was used in vellum codices. The oldest books in which it appears are the Uspensky Gospels, written in 835, and the Bodleian Euclid of 888 A.D. The chief transformations are due to the use of ligatures, as is plainly seen in the forms of the letters δ, ϑ, and σ. Hence in the fully-formed minuscule of the 11th century we find the letters α, ε, κ, λ, φ, ω, which follow the old uncial forms, while δ, η, μ, ρ are taken from the cursive. In the case of several letters the double source of this script is shown by the retention of duplicate forms, β, θ, π, and τ, for instance, being uncials, while ζ, θ, ω, and σ are of cursive origin.

From the end of the 12th century to the invention of printing the minuscule continually degenerates, losing its purity and beauty, and breaking up into a rough cursive script. The writing becomes intricate and involved, ligatures and accents being combined into a single character rapidly executed without taking the pen from the paper, thus making the writing very difficult to read. In the earliest printed books the contracted and ligatured forms of contemporary minuscule MSS. were faithfully imitated. These, however, were gradually discarded, though a few, such as 5 for στ, 8 for ου, and 9 for ος, survived till quite recent times.

Latin Palæography followed much the same course as the Greek. There were four set book-hands—capitals, uncials, semiuncials, and minuscules, of which the two last were influenced by the old Roman cursive. The capitals are of two kinds, Square and Rustic. Square capitals

differ little from the lapidary characters used in inscriptions, and may be defined as having their vertical and horizontal strokes at right angles. Of the few examples we possess of this script the best is the St Gall Virgil, assigned to the 4th century. Rustic capitals, which were more usual, are characterised by circumflexed finials and by the crossbars being curved and slightly oblique. This style, which can be traced in a Herculaneum papyrus of the 1st century A.D., was greatly in fashion from the 3d century to the 7th. Good examples are four famous Virgils: the *Codex Vaticanus* assigned to the 4th century, the *Codex Palatinus* to the 5th, the *Codex Romanus* to the 6th, all of which are in the Vatican, and the 5th century Medicean Virgil at Florence. The Rustic died out about the 9th century, and left no successor.

The uncials arose out of the square capitals, and exhibit rounded forms of certain letters. The earliest uncial codices extant are not earlier than the 4th century A.D., but it is plain that uncial

writing was practised at a much earlier period, since we find uncial forms in some of the Graffiti (q.v.) scribbled on Pompeian walls, while as early as the 3d century B.C. the lapidary forms of P, R, C, S show that uncial influences had already transformed the earlier angular shapes of these letters. The uncial book-hand is distinguished from the contemporary square capitals by the rounded forms ϵ η ι κ instead of E, M, V, H, and by the tails of P, F, Q, and R falling below the line, while the head of L rises above it.

One of the oldest uncial Latin MSS. is the Vercelli Gospels, said to have been transcribed by the hand of Eusebius himself, but in any case nearly as early as his time. A good example of the later uncials is the copy of the Gospels now in the library of Corpus Christi College, Cambridge, which is believed to have been the actual copy brought from Rome by St Augustine in 596. Also of the 6th century is the *Codex Bezae* at Cambridge, the style of which is shown in the fac-simile already given. The earlier and later uncial styles are well seen in the famous palimpsest Cicero from the monastery of Bobbio, now in the Vatican. A palimpsest is a manuscript from which the writing was washed off with a sponge, or sometimes scraped or rubbed, in order that the vellum might be used for some other work. The *Codex Ephraemi* above mentioned is a palimpsest, a 5th-century Greek text being overwritten in a 12th-century hand. The Vatican Cicero is a codex consisting of 150 leaves, containing in the first hand the treatise *De Republica*, written in double columns in large uncials, probably of the 4th century. Over this is written across the commentary of St Augustine on the Psalms, in a small uncial hand of the 7th century.

boingest quia
et omnes xpiani membra sunt xpi
membra xpi quid cantant. amant
desiderando cantant. Aliquando

In the fainter writing of the original manuscript we may decipher the words EST IGITUR INQUIT AFRICANUS RESP[ublica]. The writing in the second hand reads (line 1) HOMO EST QUIA, (2) ET OMNES XPIANI [Christiani] MEMBRA SUNT XPI [Christi], (3) MEMBRA XPI [Christi] QUID CANTANT. AMANT, (4) DESIDERANDO CANTANT. ALIQUANDO.

Towards the close of the 7th century the Latin uncial becomes rough and careless, and it deteriorates still further in the 8th, when it is replaced as a book-hand by a new script which goes by the name of semiuncial or half-uncial. This name, which arose out of a misconception of early palæographers, does not signify a script half the size of the uncial, some semiuncials being larger than some uncials, but is used to denote an uncial script with new forms of certain letters, of g and s, for instance, which were derived from the cursive. The earliest traces of the semiuncial style are found towards the end of the 5th century, and the first instance of its use as a book-hand is a Hilary, written in 509 or 510, now preserved in the Chapter Library of St Peter's at Rome.

The old Roman cursive which thus began to influence the uncial writing in the 6th century is of great palæographical importance, since it became the source of many forms in modern scripts. Its

existence has long been suspected, but actual examples have only recently been discovered. In a house at Pompeii a number of wax-tablets were found in 1875 which proved to be the business memoranda of L. Cæcilius Jucundus, a Pompeian banker and agent, mostly belonging to the years 55 and 56 A.D., and relating to purchases at auctions, and payments of taxes on behalf of his clients. Similar tablets, which are dated from 131 to 167 A.D., have been discovered in abandoned gold-workings in Dacia. This old Roman cursive, which is very illegible, exhibits the forms out of which arose f (the long s) and also the modern forms g, b, i, m, n, d, r, h, which replaced the capital and uncial forms G, B, F, M, N, D, R, H. This illegible Roman cursive reappears in a more set official hand in rescripts addressed to Egyptian functionaries in the 5th century, in official documents written at Ravenna in the 6th century, as well as in numerous marginal notes in uncial or semiuncial manuscripts. It is also employed in a copy of Avitus, written in the 6th century, and a Josephus of the 7th. These two books are written on papyrus, and the absence of other examples may be explained by the fact that the fragile papyrus books, probably copies made by scholars for their own use, have mostly perished, only vellum codices as a rule having been preserved.

With the establishment of the Teutonic kingdoms on the ruins of the Roman empire a number of national scripts arose—the Merovingian in France, the Visigothic in Spain, and the Lombardic in Italy. These were all based on the Roman cursive, and were used for civil purposes as well as for charters and other diplomatic documents. The Merovingian became the official hand of the

Frankish empire. It is cramped and vermiform, with exaggerated loops for the heads and tails to certain letters. It was used as the diplomatic hand in the chanceries of France and Italy till the 9th century, and in the imperial chancery till 1231, when its use was abolished by Frederick II. It has survived, however, in a modified

form in the modern German cursive, in which many of the peculiar forms of the old Roman cursive can be detected. Out of the official Roman cursive arose the script, which was employed in papal bulls till the 12th century, when it was replaced by the French minuscule, which was used till the 16th century, when a deformed, contracted, and illegible script called the *littera Sancti Petri* was adopted.

The old cursive derives its chief importance from having been one of the sources from which was developed the semiuncial book-hand which superseded the old uncial. Incorporating sundry uncial forms, the Visigothic and Lombardic cursives developed in the monasteries into calligraphic book-hands. But the Irish semiuncial is the most important of the national scripts, as it became the basis of the 'Roman type,' which is used in our modern printed books. The history of this Irish semiuncial is obscure. Its elements must have been obtained, probably in the 5th century, from the semiuncial book-hand of southern Gaul. The forms of some of the letters are plainly those of the Roman uncial; others are calligraphic forms which must have been derived from an ecclesiastical Gallican type of the Roman cursive. Just as the Greek minuscule has duplicate forms of certain letters, some derived from the uncial, others from the cursive, so the double parentage of the Irish

semiuncial is demonstrated by the permissive use of N, R, S, which are uncials, and of n, r, s, which are uncialised cursives. Several other forms, such as g, b, a, m, f, h, l, are also uncialised cursives, and not, like the Roman uncials, merely rounded capitals (see IRELAND, Vol. VI. p. 208). This Irish semiuncial suddenly blazes forth in the 6th century as the most splendid of all mediæval scripts. The noblest specimen is the magnificent Book of Kells now at Dublin, which was probably written in the 7th century, though often referred to the 9th (see ILLUMINATION). Of somewhat later date are St Chad's Gospels, now at Lichfield, and the Lindisfarne or Durham Book, commonly called St Cuthbert's Gospels, now in the British Museum, both of which were written in Northumbria, where the script had been introduced by Irish missionaries. This Northumbrian semiuncial formed the basis of the nearly perfect Caroline minuscule, so called because during the reign of Charlemagne it was introduced by Alcuin of York, the friend and preceptor of the emperor, into the calligraphic school at Tours, over which Alcuin presided from 796 to 804. Alcuin seems to have incorporated certain elements from the Roman uncial and the Lombardic minuscule; and the new script, recommended by its legibility, distinctness, and minuteness, was rapidly diffused by Alcuin's pupils over Europe, and rapidly superseded all the other monastic book-hands. Starting at the beginning of the 9th century, it reached its highest perfection at the end of the 11th. In the 13th deformation set in; it stiffens and becomes more cramped, ligatures and contractions are introduced, and out of it grew the Black Letter or Gothic of the 15th century, a form of which still survives in German printed books. The black letter was used in the earliest printed books, but, with the revival of learning, Italian scholars returned to the beautiful Caroline minuscule of the 11th century, which was imitated in the Roman type now universal in Italy, France, Spain, Britain, and America, and which is rapidly replacing the Gothic letter in northern Europe. See PRINTING.

Besides the pure Caroline minuscules used for books, various cursive hands grew out of it, more angular, irregular, and difficult. Such are the Anglo-Saxon and the pointed Irish, the Domesday script (see DOMESDAY), and the deformed hands used in English charters and the records of courts of law. Our modern English script is based on this 'court-hand,' which arose out of the degraded Caroline minuscule—improved, however, in the reign of Elizabeth by the influence of the contemporary Italian hand. It is, however, much superior in legibility and distinctness to the modern German script, which, as we have seen, is to a great extent a survival from the old Roman cursive.

Contractions.—The difficulty of deciphering mediæval MSS. arises largely from the contractions, abbreviations, and ligatures which were employed to economise labour and parchment. To give a complete list within reasonable limits is impossible, more especially as they varied at different periods and in the various scripts. More than 5000 contractions of Latin words were used in France between the 7th century and the 16th, while in England more than 1000 are found in official Latin documents of the Tudor period alone. There are, for instance, six recognised contractions for *quoniam*, seven for *esse*, and ten for *et*. In one class of MSS. *qm̄* stands for *quoniam*, in another for *quum*, while *quō* denotes *quomodo* in one script and *quoniam* in another. Instead, therefore, of attempting to catalogue the more usual contractions, which are tabulated in several works referred to below, it will be more useful to explain the general principles by which mediæval scribes were guided. In

most cases, if not in all, these contractions arose out of ligatures, and were used at first for some particular syllable, and then as time went on they were generalised, so as to denote a whole class. Some of these ligatures we still use. Thus, *w*, as the name implies, is a ligature for *uu*; *æ* and *œ* need no explanation. The two superscript dots, as in *ä* or *ö*, which express the German *umlaut*, are merely the ligatures *æ* and *œ*.

The usual modern sign of abbreviation is the full point, as in *ib.* or *ibid.* for *ibidem*, e.g. for *exempli gratia*, or i.e. for *id est*. But this, which seems so natural and simple a sign, appears, when we trace its history, to have arisen out of a ligature for the common Latin termination *-us*. Its earlier form was the colon (:), which stood for *-us*, as in *omnib:* for *omnibus*. The origin of this colon is explained by the fact that at a still earlier time we find the final syllables *-mus* and *-us* written *mf* and *uf*, where the cross stroke *f*, which is merely the long *s*, forms a ligature with the curve *u* which represents *u*. Of this ligature, representing *-us*, everything disappeared except the dots at the top and bottom of the *s*, leaving *m:* for *-mus*, or *b:* for *-bus*. The upper dot was then omitted as needless, and ultimately the use of the full point (.) was generalised so as to denote the omission of any final syllable. When this had taken place another special sign was required for *-us*. This was *9*, so that in later documents we find *eig* for *ejus*, or *omnib9* for *omnibus*. But in earlier MSS. the loop of the sign *9* is open at the top, the form *y* being manifestly the ligature of *u* and the long *s*.

In *viz.* for *videlicet*, and *oz.* for *ounce*, we have survivals of a very frequent abbreviation, which also proves to be a ligature. The *z* is merely used by printers for their own convenience instead of the correct sign *3*, which is found, by tracing it back, to be only a rapid and slurred way of writing the semicolon (;) without taking the pen from the paper. This sign at one time denoted only the omission either of *et*, as in *hab;* for *habet*, or of *ue*, as in *q;* for *que*. The latter, however, was originally written *q;* where the reversed comma (,) is the letter *u*, and the dot stands for *e*, as in many other cases, such as *n.* for *enim*, or *÷* for *est*. This ligature was assimilated to the nearly identical ligature (;) for *et*, where the dot (.) represents *e*, and the comma (,) is the remains of the letter *t*. For a long time this ligature (*3* or *;*) was confined to words ending in *ue* or *et*, as in *qn3* for *quandoque*, *quo3* for *quoque*, *ā3* for *apparet*, *o;* for *oportet*, *l;* for *licet*, *t3* for *tenet*, *h3* for *habet*, *s;* for *scilicet*. Afterwards it was generalised to signify the omission of any final syllable, as in *oz* for *ounce*, or in the apothecaries' signs *3* for *uncia*, and *3* for *drachma*. The sign *9* for scruple is merely the ligature *sr*, the long *s* being crossed by a cursive *r*.

The superscript comma now used to denote the omission of medial syllables or letters, as in *can't* for *cannot*, or *I've* for *I have*, was at first merely a superscript *r*, and denoted exclusively the omission of *r* or of a syllable containing *r*, such as *er* or *re*. In English records it forms a ligature with the preceding letter, as in *fint* for *fuertunt*, *¶bo* for *verbo*, or *ts* for *tres*.

The circumflex (˘) grew out of a cursive form of the uncial *m*, and originally denoted exclusively the omission of *m*, then of *n*, and afterwards of other letters. Thus we have *oñes*, *oñs*, and *oēs* for *omnes*, *oñia* and *oñia* for *omnia*, *hōiū* and *hōiū* for *hominum*, *nō* and *n̄* for *non*. The horizontal line (ˉ) is one of the earliest signs of omission, and in some cases, if not in all, is merely a simplified form of the circumflex, as in *δ* for *cum*, *āut* for *autem*, *ā* for *annos*. Its use was, however, less restricted than that of the circumflex, and we still use it in the contraction *lb* for *libra* (pounds), the

double bar in £ denoting a double omission. Shillings and pence, now expressed by s. and d., were formerly denoted by s and d, abbreviations for *solidi* and *denarii*. The sign \$ for dollars is said to be the ligature *dli*, the S being merely *δ*, a cursive Dutch form of *d* (but see DOLLAR). The circumflex (~) which was a cursive *m* was not always written horizontally. We see this in the common sign *z* used for *rum*, as *suo^z* for *suorum*, or *ivo^z* for *servorum*. Here *z* is the ligature of *r* and *u*, which is crossed by *m* in the cursive form (~) or (—) written vertically. For *et* there are numerous signs, all of which resolve themselves into ligatures. Some of them, such as &, &, and &, require no explanation. They are found in &ia for *etiam*, and in the various forms &c&era, or &c&la, or &cet. or &c, or finally &c. which we now use for *et cetera*. The sign 7, used in Domesday for *et*, is also a ligature, as is shown by the older forms *7* and *7*. The sign + or ÷ for *est* is also a ligature, the upper dot standing for *e*, the bar or circumflex for the long *s* (f), and the lower dot for *t*. In like manner *esse* is written ≈, the two dots each representing *e*, and the two circumflexes being each a long *s*. This became = and then =, whence we obtain =s for *esses*, =t for *esset*, and =m for *essemus*.

Many similar contractions were also used, most of which can be easily resolved into ligatures. A few of the more common are *p* for *pro*, *p* for *per* and *por*, and *p* and *β* for *præ*, *q* for *quam*, *q* for *quod*, *q* for *qui*, *s* for *sz*, *fr* for *frater*, *i* for *vel*, *t* for *ser* and *si*. Thus we have *supius* and *supiq* for *superius*, *ppe* for *prope*, *pz* for *proximus*, *geho^t* for *generosi*, *ass-* for *assisa*, *his* for *fitz*.

BIBLIOGRAPHY.—The study of Palæography requires either an ample purse or access to a good library, the needful works being mostly bulky and costly. The best books of moderate price for the beginner in Greek Palæography are Wattenbach's *Anleitung zur Griechischen Palæographie* and *Schrift-tafeln*, and Gardthausen's *Griechische Palæographie*. For Latin Palæography it would be well to begin with Wattenbach's *Anleitung*, and Arndt's *Schrift-tafeln*. For Mediæval Palæography, Chassant's *Palæographie des Chartes et des Manuscrits*, with his companion volume, *Dictionnaire des Abréviations du Moyen Âge*, are extremely useful little books. Prou's *Manuel de Paléographie* may also be consulted. For English Charters, the student, awaiting Mr Maunde Thompson's long-promised work, has had to fall back upon Wright's *Court-Hand Restored*, published in 1773, and the article 'Records' in Savage's *Dictionary of Printing*. The evolution of the forms of letters is traced in Dr Taylor's book on *The Alphabet*. Subsidiary matters, such as writing materials, gatherings, lineation, punctuation, &c., which are useful in determining the age of MSS., are discussed in the works of Prou and Gardthausen already mentioned, and also in Wattenbach's *Schriftwesen im Mittelalter*, and Leist's *Urkundenlehre*. Of the more costly works, far the most important are the autotype fac-similes published by the Palæographical Society, with Zangemeister's *Exempla Codicum Latinorum*, Wattenbach's *Exempla Codicum Græcorum*, and his *Scripturæ Græcæ Specimina*. For MSS. in England, the fac-similes of National MSS., of Anglo-Saxon MSS., of ancient charters, and of ancient MSS. in the British Museum must be consulted; for German MSS., Sybel's *Works* and Sichel's *Monumenta Graphica*; for Russian, Sabas' *Specimina Palæographica*; for Italian, the *Archivio palæografico Italiano*; for Spanish, the *Exempla Scripturæ Visigoticæ*; for French, the *Notices et Extraits des Manuscrits*, and the valuable publications of Delisle and Letronne. Among the older works the most important are Walther's *Lexicon Diplomaticum*, Wailly's *Éléments de Paléographie*, Astle's *Origin and Progress of Writing*, Silvestre's *Paléographie Universelle*, Montfaucon's *Palæographie Græca*, Mabillon's *De Re Diplomatica*, and the Benedictine *Nouveau Traité de Diplomatique*.

Palæolithic. See ARCHÆOLOGY, FLINT IMPLEMENTS, STONE AGE; also MAN.

Palæologus, the name of an illustrious Byzantine family, which first appears in history about

the 11th century, and attained to imperial dignity in the person of Michael VIII. in 1260 (see BYZANTINE EMPIRE). The last of the dynasty, Constantine XI., fell bravely fighting at the siege of Constantinople. His brothers were princes of the Morea and of Achaia respectively; a daughter of one of them married Ivan III. of Russia. A branch of the family ruled Montferrat from 1306 to 1533.

Palæontology (Gr., 'study of ancient life'), the science or study of fossil organic remains—whether of animal or plant life. The study of fossil animals is sometimes termed palæozoology, and that of fossil plants palæophytology. The aim of palæontology is to attain a knowledge of all the various plants and animals which have successively appeared and disappeared in the course of geological ages. But as the geological record is highly imperfect, and myriads of species must have lived and died without leaving any trace behind them, it is obvious that our knowledge, no matter how enlarged it may become, can never possibly be complete. The history is full of gaps, some of which may eventually be bridged over, but, however that may be, it is nevertheless certain that our knowledge must always bear but a small proportion to our ignorance. Nevertheless, the study of palæontology has been fruitful in results. It has greatly influenced zoology and botany—and that not merely by adding to the number of subjects with which those sciences deal, but especially by the light which it has thrown on the evolution and mutual relations of existing forms of life. Fossil organic remains consist chiefly of the harder parts—such as bones, scales, teeth, shells, crusts, spines, &c.—of animals, and the ligneous tissues of plants (see FOSSILS). In attempting to interpret the evidence supplied by such remains, palæontologists were early led to study, for purposes of comparison, the structures of existing plants and animals. By applying the results of these comparisons to the restoration of extinct forms of life, Cuvier was enabled to establish the law of the 'correlation of organs'; and thus the palæontologist, who has to deal principally with fragmentary remains, is not in such a helpless case as might have been supposed. 'Stated in its most general form, the law of the correlation of organs is the law that all the parts of an organism stand in some relation to one another, the form and characters of each part being more or less closely dependent on, and connected with, the form and characters of all the rest. In other words, an organism is not a fortuitous collocation of unrelated parts, but is composed of mutually adapted and related organs; the possession of any given organ, therefore, implying the possession of other "correlated" parts' (Nicholson and Lydekker). Hence the palæontologist can often infer from an isolated organ or structure the essential characters of the remainder of the organism. But, while the biological sciences have greatly benefited, it is geology which has been most advanced by palæontological research. Without the help of fossils the geologist would be unable to reconstruct the past. By their aid he is able to identify and correlate the various formations which constitute his systems. It is from them that he infers former climatic and geographical changes—that he is able to distinguish between fresh-water and marine, shallow-water and deep-sea conditions, &c. But for the general relations of palæontology to geological research the reader is referred to the article GEOLOGY. Some account of the palæontology of the stratified or fossiliferous rocks will be found in the articles that deal with the various geological systems. Here all that need be done is to summarise the characteristic features of the Palæozoic, Mesozoic, Cainozoic, and Quaternary or Post-Tertiary faunas and floras.

Palæozoic Life.—The most prominent types of Palæozoic times were Graptolites, Rugose corals, Brachiopods, Crinoids, Pteropods, Nautilid Cephalopods, Trilobites, Eurypterids, and Heterocercal Ganoids. Graptolites ranged from the Cambrian into the Lower Old Red Sandstone, but attained their maximum in Lower Silurian times. Rugose corals, unknown in the Cambrian, swarmed in Silurian, Devonian, and Carboniferous seas, but were much less numerous in those of the Permian. Crinoids first appear in the Cambrian, are numerous in Silurian and Devonian rocks, but more abundant still in the Carboniferous. After this they begin to decline. Brachiopods, commencing in the Cambrian, abounded all through Palæozoic times, but culminated in the Upper Silurian period. They were still numerous in Devonian and Carboniferous seas, but less abundant in those of the Permian period. Pteropods were more common in Upper Cambrian and Silurian than during Devonian and Carboniferous times. Nautilid Cephalopods first appear in the Upper Cambrian, and seem to culminate in the Silurian, but they continued to abound in the Devonian and Carboniferous seas, becoming reduced in those of the Permian period. Trilobites appear first in the Cambrian, reach a maximum in the Silurian, wane in the Devonian and Carboniferous, and die out in the Permian. They are therefore essentially and characteristically Palæozoic forms. So likewise are the Eurypterids, which, culminating apparently in the Upper Silurian and Old Red Sandstone, became extinct in Carboniferous times. Ganoids with heterocercal tails first appear in Upper Silurian strata, and reach their maximum in the Old Red Sandstone. The great order of Sharks and Rays likewise dates back to Upper Silurian times. Such are the more prominent types in Palæozoic strata. Many other forms, however, are met with, amongst which may be noted starfishes (Asteroidea), brittle-stars (Ophiuroidea), sea-urchins (Echinoidea), and the wholly extinct and characteristic Palæozoic types, Cystoidea and Blastoidea. Amongst the crustacea were cirripedes, ostracods, phyllopods, king-crabs, amphipods, isopods, long-tailed decapods, and stomapods. Arachnids were represented by scorpions and other forms; myriapods and insects by a number of ancestral types. All the great classes of molluscan life were present—Cephalopods appearing first in the Upper Cambrian; Pteropods in Lower Cambrian; Gasteropods in Lower Silurian; and Lamellibranchs in Upper Cambrian. The fishes have been already mentioned. Amphibians, represented by Labyrinthodonts and Salamandroids, appear first in Carboniferous strata.

Amongst plants the prominent Palæozoic types are cryptogams—Lepidodendroids, Sigillarioids, and Calamites being exclusively Palæozoic, but conifers were also present.

It may be noted that many of the characteristic life-forms of Palæozoic times were what are termed *synthetic* or *comprehensive* types, that is to say, types which while belonging fundamentally to some particular division or group of the animal kingdom, yet present in their structure characteristics of one or more contemporaneous, or as yet non-existing types. Among such intermediate or comprehensive forms may be mentioned the Labyrinthodonts, which were urodele amphibians with many piscine and reptilian characteristics. Examples are also furnished by the Ganoids, the Trilobites, the Brachiopods, the insects, &c. Amongst plants the Lepidodendroids exhibit similar peculiarities, for they combine characteristics of club-mosses and conifers. Again, many Palæozoic forms attained a larger size than the corresponding forms that belong to later times. Thus, some of the ptero-

poda, cephalopods, ostracods, phyllopods, and insects were larger than any corresponding forms of our own day. The amphibians likewise exceeded in size any living representatives of their class.

Innumerable Palæozoic genera died out before Mesozoic times, while not a few lived on, and some have even persisted to the present day. These persistent forms are met with chiefly among the lower types of animal life, as foraminifers, brachiopods, and molluscs. See CAMBRIAN, SILURIAN, OLD RED SANDSTONE, CARBONIFEROUS, and PERMIAN SYSTEMS.

Mesozoic Life.—The life of Mesozoic times is in many respects strongly contrasted with that of the Palæozoic era. In place of Sigillarioids and Lepidodendroids, the prevalent forms of plant-life up to the close of the Cretaceous period were arborescent and herbaceous ferns, conifers, and cycads, while in late Cretaceous times the earliest angiosperms appeared. Corals, which were plentiful in Mesozoic seas, consisted almost exclusively of modern types—the rugose corals having waned almost to extinction. Echinoids and starfishes abounded, but Crinoids, so prevalent in Palæozoic seas, were now much reduced in numbers. Some of the higher grades of the crustacea, which are hardly known in Palæozoic rocks, were plentiful in Mesozoic times, and the same was the case with insects. Brachiopods ceased now to be dominant forms; while amongst molluscs the Cephalopods take the lead, and reach their culmination in swarms of Ammonitidæ and Belemnitidæ. Gasteropods and Lamellibranchs are well represented, and include a number of modern genera, which increased towards the close of the era. Ganoids were still numerous, mostly with symmetrical tails. Chimaeroids, true sharks, and rays were all represented, while Teleostean or bony fishes made their first appearance. Labyrinthodonts, which in Triassic times attained a great size, soon died out, making way for the advent of a prodigious reptilian fauna, in which all orders, save the Ophidians, were represented. There were swimming reptiles (Ichthyosaurus, q.v., Plesiosaurus, q.v.), flying reptiles (Pterodactylus, q.v.), snake-like reptiles (Dinosaurs, see DINOSAURIA), crocodiles, and chelonians. This reptilian life was especially abundant in Jurassic times. Birds probably were numerous, some of the forms being toothed, while others may have approximated to modern types. Mammals were represented by only the inferior grade of marsupials, and were all of small size. All the remarkable reptiles referred to became extinct before the beginning of the Cainozoic era. So it was with the characteristic Mesozoic molluscan families of Ammonitidæ, Belemnitidæ, and Hippuritidæ. Putting aside the lowly organised Protozoa, it may be said that hardly one Cretaceous species has been met with in Cainozoic or Tertiary strata. See TRIASSIC, JURASSIC, and CRETACEOUS SYSTEMS.

Cainozoic Life.—The plants of early Cainozoic times, although differing specifically and often generically from living forms, yet approach on the whole to existing types. Palms were a common feature of the floras from Eocene into Pliocene times. Indo-Australian types were common in Europe during the early Eocene, but later on forms characteristic of the warmer latitudes of North America began to abound. A commingling of Indo-Australian and American types also marked the Oligocene period, but the American forms gradually increased until in Miocene times they preponderated over all the others. The Pliocene flora of central Europe had a prevalent Mediterranean character. With regard to the lower forms of animal life, all that need be noted here is the general fact that these have a modern aspect, the

number of existing genera and species becoming greater as we advance from the lower to the higher stages. The foraminifers attained now their maximum development, and are characteristically represented by the large coin-shaped nummulites. Amongst molluscs the Cephalopods are no longer dominant forms—the most abundant groups being Lamellibranchs and Gasteropods. But the most striking and leading Cainozoic forms were the mammals. In Eocene times the mammals were greatly developed—many of the forms attaining a large size. Among the more notable types of the early European Tertiary are *Palæotherium* (q.v.), *Anoplotherium* (q.v.), along with which were carnivores, rodents, insectivores, and bats, and also the earliest representatives of the horse and the monkey tribe. The later Tertiaries are marked by the appearance of Dinotheres, Mastodons, true elephants, rhinoceroses, hippopotamus, deer, antelope, gazelles, various carnivores, such as *Machairodus*, bears, cats, wolves, &c., and apes. No certain or unequivocal evidence of man is yet forthcoming from Tertiary strata.

While it is true that the general aspect of the plant and animal life of the Cainozoic era approaches to that of the present, yet this is truer for the less highly organised types than it is for those which are higher in the scale of being. Amongst the higher vertebrates of early Tertiary times not a few possessed characters which are now met with only in widely separated forms. Some, for example, were intermediate in character between tapirs and horses; in others (*Tillodonts*) we meet with a combination of structures now seen in ungulates, rodents, and carnivores; while many of the carnivores had decided marsupial affinities. Other remarkable composite forms were the *Dinocerata* (q.v.).

Quaternary or Post-Tertiary Life.—The animals and plants of Quaternary age belong for the most part to existing species; a number of the higher vertebrates, however, are extinct. Among these latter, in Europe, were the *Mammoth* and various other elephants, several rhinoceroses, a dwarf form of hippopotamus, and *Machairodus*. In North America the fauna also included various extinct species, such as *Mastodon*, an elephant, and several gigantic members of the Sloth family (*Megatherium*, *Myiodon*, *Megalonyx*). These last seem to have abounded in South America, where they were associated with great armadillos (*Glyptodon*). The Quaternary period was characterised by marked oscillations of climate, and consequently by secular migrations of flora and fauna. Thus numerous forms which had survived from the Tertiary era eventually became extinct, and a still larger number were banished from the areas which they had occupied in Pliocene times. It is in the deposits of the Pleistocene that we meet with the first unquestioned relics and remains of man. See **PLEISTOCENE SYSTEM, POSTGLACIAL AND RECENT SYSTEM**; works cited at **GEOLOGY**; and the special handbooks of **Paleontology**, as by Nicholson (new ed. 1879), Seeley (1885), Steinmann and Döderlein (1888), Zittel (i.-iii. 1879-90), &c.

Palæotherium (Gr., 'ancient wild beast'), a genus of pachydermatous mammalia whose remains occur in the Eocene beds of England and the Continent. Several species have been described, ranging in size from that of a sheep to that of a horse. The Upper Eocene gypseous quarries of Montmartre supplied the first scanty materials, which Cuvier, by a series of careful and instructive inductions, built up into an animal resembling the existing tapir. The restoration, however, is not quite correct, for the discovery of a complete skeleton (*P. magnum*) shows that the animal was longer-necked, and of a more slender build than the tapir,

and probably was not unlike, in general appearance, the living llama. There can be no doubt, however, that *Palæotherium* resembled the tapir in having the snout terminating in a short proboscis. It had three toes on each foot, each terminated by a hoof. The formula of the teeth is i. $\frac{3}{1}$, c. $\frac{1}{1}$, p.m. ($\frac{3}{1}$ - $\frac{4}{1}$), m. $\frac{3}{1}$, and the structure of the upper true molars, in certain particulars, seems to foreshadow that of some of the *Equidæ*.

Palæotherium magnum.

It is supposed that animals of this genus dwelt on the margins of lakes and rivers, and that their habits were similar to those of the tapir.

Palæozoic (Gr., 'ancient life'), the name given to the lowest division of the fossiliferous rocks, because they contain the earliest forms of life. They were formerly, and are still generally, known as the **Primary rocks**. The strata included under these titles are the Cambrian, Silurian, Devonian and Old Red Sandstone, Carboniferous, and Permian systems.

Palafox y Melzi, JOSÉ DE, Duke of Saragossa, a Spanish soldier, was born in 1780 of a distinguished Aragonese family, and rose to the rank of brigadier-general in the Spanish guards. His defence of Saragossa (q.v.), 22d July 1808 to 21st February 1809, which only yielded to the French after a second investment, is one of the most heroic incidents in modern history. Palafox y Melzi was carried prisoner to France, and not released until 1813. The year after his return home he was appointed captain-general of Aragon, in 1836 was created Duke of Saragossa, and in 1837 grandee of Spain and captain-general of the guards. He died at Madrid, 15th February 1847.

Palagonite-tuff, usually associated with basalt-lavas, is fine-grained, red, brown, and sometimes greenish or yellowish in colour. Under the microscope it is seen to be composed of minute fragments of volcanic glass, crowded amongst which are granules and crystals of augite, olivine, plagioclase, and magnetite. It occurs in Sicily, the Canary Islands, the Faroe Islands, Iceland, and Scotland. See **IGNEOUS ROCKS**.

Palanpur, capital of a native state in Gujarat, lies 83 miles N. of Ahmedabad by rail. The state has an area of 3150 sq. m. and a pop. of 234,402. The 'Palanpur Agency' comprises, besides Palanpur, twelve other small native states.

Palanquin, or **PALKI**, an Indian vehicle corresponding somewhat to the Roman litter and the modern European sedan-chair, but, unlike the latter, used for long distances by travellers where railways or good carriage-roads do not exist. It is a wooden box, about 8 feet long, 4 feet wide, and 4 feet high, with wooden shutters which can be opened or shut at pleasure, and constructed like Venetian blinds. At each end of the palanquin, on the outside, two rings are fixed, and the *hammals*, or palanquin-bearers, of whom there are four, two at each end, support the palanquin by a pole passing through these rings.

Palapteryx (Gr., 'ancient apteryx'), a genus of fossil birds whose remains are found in the river-silt deposits of New Zealand, associated with the gigantic *Dinornis*, and which, like it, resembled in the form of the sternum, and the structure of the pelvis and legs, the living wingless apteryx. *Palapteryx*, however, seems to have possessed rudimentary wings, in which respect it differed from *Dinornis*. See MOA.

Palate, the roof of the mouth, consists of two portions, the hard palate in front and the soft palate behind. The framework of the *hard palate* is formed by the intermaxillary bones, the palate processes of the superior maxillary bones, and by the horizontal processes of the palate bones, and is bounded in front and at the sides by the alveolar arches and gums, and posteriorly is continuous with the soft palate. It is covered by a dense

The Mouth widely opened so as to show the Palate :

- 1, 1, the upper, and 2, the lower lip; 3, 3, the hard palate; 4, 4, the soft palate; 5, 5, the uvula; 6, 6, the arches of the soft palate; 7, 7, the tonsils; 8, the tongue.

structure formed by the periosteum and mucous membrane of the mouth, which are closely adherent. Along the middle line is a linear ridge or raphe, on either side of which the mucous membrane is thick, pale, and corrugated, while behind it is thin, of a darker tint, and smooth. This membrane is covered with scaly epithelium, and is furnished with numerous follicles (the palatal glands). The *soft palate* is a movable fold of mucous membrane enclosing muscular fibres, and suspended from the posterior border of the hard palate so to form an incomplete septum between the mouth and the pharynx; its sides being blended with the pharynx, while its lower border is free. When occupying its usual position (that is to say, when the muscular fibres contained in it are relaxed) its anterior surface is concave; and when its muscles are called into action, as in swallowing a morsel of food, it is raised and made tense, and the food is thus prevented from passing into the posterior nares, and is at the same time

directed obliquely backwards and downwards into the pharynx.

Hanging from the middle of its lower border is a small conical pendulous process, the *uvula*; and passing outwards from the uvula on each side are two curved folds of mucous membrane containing muscular fibres, and called the *arches* or *pillars of the soft palate*. The *anterior pillar* is continued downwards to the side of the base of the tongue. The *posterior pillar* is larger than the anterior, and runs downwards and backwards to the side of the pharynx. The anterior and posterior pillars are closely united above, but are separated below by an angular interval, in which the *tonsil* of either side is lodged. The tonsils (*amygdalæ*) are glandular organs of a rounded form, which vary considerably in size in different individuals. They are composed of an assemblage of mucous follicles, which secrete a thick grayish matter, and open on the surface of the gland by numerous (twelve to fifteen) orifices. The space left between the arches of the palate on the two sides is called the *isthmus of the fauces*. It is bounded above by the free margin of the palate, below by the tongue, and on each side by the pillars of the soft palate and tonsils.

As the upper lip may be fissured through imperfect development (in which case it presents the condition known as *Hare-lip*, q.v.), so also may there be more or less decided fissure of the palate. In the slightest form of this affection the uvula merely is fissured, while in extreme cases the cleft extends through both the soft and hard palate as far forward as the lips, and is then often combined with *hare-lip*. When the fissure is considerable it materially interferes with the acts of sucking and swallowing, and the infant runs a great risk of being starved; and if the child grows up its articulation is painfully indistinct. The closure of cleft palate by operation must be left in the hands of an experienced surgeon, who should be called to see the child as soon as the defect is noticed. If the separation is too great to admit of closure by operation, a plate or 'artificial palate' may be made to cover the opening.

Acute inflammation of the tonsils, popularly known as *Quinsy*, is treated of in a separate article. Chronic enlargement of the tonsils is very frequent in scrofulous children, and is not rare in scrofulous persons of more advanced age, and may give rise to very considerable inconvenience and distress. It may occasion difficulty in swallowing, confused and inarticulate speech, deafness in various degrees from closure of the Eustachian tubes (now often termed *throat deafness*), and noisy and laborious respiration, especially during sleep; and it may even cause death by suffocation, induced by the entanglement of viscid mucus between the enlarged glands. If local and constitutional remedies fail to reduce the enlarged tonsils they must be more or less removed by the surgeon, either by the knife or scissors, or by a small *guillotine* specially invented for the purpose.

Enlargement or relaxation of the uvula is not uncommon, and gives rise to a constant tickling cough and to expectoration, by the irritation of the larynx which it occasions. If it will not yield to local treatment it may require to be removed either in whole or in part.

Palatinate, a name applied to two German states, which were united previously to the year 1623. They were distinguished as the Upper and Lower Palatinate. The Upper or Bavarian Palatinate, now forming a circle of the kingdom of Bavaria, was a duchy, its capital being Amberg. The Lower Palatinate, or the Palatinate on the Rhine, lay on both sides of the Rhine, with an area of 3150 sq. m., and included, besides the Electoral

Palatinate proper, the principality of Simmern, the duchy of Zweibrücken, the principalities of Veldenz and Lautern, &c., and was bounded by Mainz, Trèves, Lorraine, Alsace, Baden, and Würtemberg. Its capital was Heidelberg.

The counts of the Rhenish Palatinate were established in the hereditary possession of the territory of that name, and of the lands attached to it, as early as the 11th century. In 1216 it was granted to the Duke of Bavaria, and with various combinations the Rhenish Palatinate and the Bavarian territories were held by members of the Bavarian house and its branches. Sometimes the electoral dignity was alternately exercised by the Duke of Bavaria and the holder of the Rhenish Palatinate. In 1559 the Rhenish Palatinate and the electoral vote passed to Frederick III., who introduced Calvinism. Frederick V. (q.v.) was the 'Winter King' of the Thirty Years' War, who in 1623 lost his lands to his kinsman the Duke. Bavaria retained the Upper Palatinate and the electoral dignity; but the Rhenish Palatinate was in 1648 given to Frederick's son, and the eighth electorate created for him. In 1694, during the war of the Spanish succession, the elector received again the Upper Palatinate and all the ancient rights, resumed again by Bavaria after the war. During this time the Rhenish Palatinate was repeatedly and cruelly desolated by French armies; and in 1801 France took possession of all on the left bank of the Rhine, giving the rest to Bavaria, Nassau, and Hesse Darmstadt. In 1815 the left bank was restored to Germany, the larger part of the Lower Palatinate being granted to Bavaria (Rhenish Bavaria); Prussia got the Rhine Province; Hesse Starkenburg and Rhine Hesse; and Baden Mannheim, Heidelberg, and Mosbach. The palatinate had to change its religion frequently in accordance with the tenets of the reigning prince, being successively Catholic, Calvinist, Lutheran, Calvinist, and Catholic again. For the area and population of the modern provinces of the Upper and Lower Palatinate, see the article BAVARIA.

Palatine (from Lat. *palatium*, 'palace'). A *Comes Palatinus*, or Count Palatine, was, under the Frankish kings of France, a high judicial officer (see COUNT), his district being called a *palatinate* or *county palatine*. There were long three counties palatine in England—Lancaster, Chester, and Durham—the two last of which were, no doubt, made separate regalties on account of their respective proximity to the frontiers of Wales and of Scotland. Chester and Durham became palatine under William I., Lancaster not till 1451. Chester had not merely its own courts, judges, constable and steward, but a parliament, and was not represented in the national parliament till 1549. At various dates Kent, Shropshire, Pembrokeshire, the Isle of Ely, and Hexhamshire, were counties palatine, but had lost their special rights by the 16th century. Cheshire was assimilated by Henry VIII. Durham ceased to be a county palatine under its bishop in 1836; and Lancaster (see LANCASTER, DUCHY OF) yielded its jurisdiction in 1873 to the High Court of Justice. In very early times there were a number of similar privileges in Scotland, the most important of which was that of the Earls Palatine of Strathearn.

Palatine Hill (*Mons Palatinus*), the central hill of the famous seven on which ancient Rome was built, and, according to tradition, the seat of the earliest Roman settlements. See ROME.

Pale, in Irish history (see IRELAND, Vol. VI. p. 204), means that portion of the kingdom over which the English rule and English law was acknowledged. It varied very greatly at various dates, but for a long period meant generally

Dublin and the greater part of the adjoining counties.

Palem'bang, capital of a residency (formerly an independent kingdom) near the south end of Sumatra, stands on the river Musi, 50 miles from its mouth; the houses of the town are built on great log rafts on either bank. Manufactures, trade in silk goods, carved wood, ornaments in gold and ivory, and krises, as well as shipbuilding, are carried on. In the middle ages Palembang was one of the most important centres of Arabian trade with China. Pop. 43,368; and of the residency, 627,419.

Palencia (the ancient *Pallantia*), a walled city of Spain, in Old Castile, stands in a fruitful plain, 180 miles by rail NNW. of Madrid and 29 NNE. of Valladolid. The Gothic cathedral was built 1321–1504. The first university of Castile was founded here in 1208, but was removed to Salamanca in 1239. Blankets and coarse woollen cloths are manufactured. The vine is cultivated, and there is a good trade in wool. Pop. 14,506. —The province of Palencia has an area of 3256 sq. m. and a pop. (1887) of 183,954.

Palenque, RUINS OF, lie between the Michol and Chacamas rivers, in the north of the Mexican state of Chiapas, 64 miles E. of the village of Santo Domingo de Palenque. The ruins extend over 20 to 30 acres, and are buried in a dense tropical forest; trees grow over and about the buildings, and rise even from the tower. The ruins consist of vast artificial terraces, or terraced truncated pyramids, of cut stone, surmounted by edifices of peculiar and solid architecture, also of cut stone, covered with figures in relief, or figures and hieroglyphics in stucco, with remains of brilliant colours. Most of the buildings are of one story, but a few are two, three, and some may have been four stories. The principal structure, known as the Palace, is 228 feet long, 180 feet deep, and some 25 feet high, standing on a terraced truncated pyramid of corresponding dimensions; the front contained fourteen doorways, each about 9 feet wide. The building was irregular, and built in two distinct parts, with double galleries of unequal length running round it, and two large courts, also irregular in shape. Charnay holds that the Palace was a magnificent convent; Palenque, he says, was a holy city, 'a place of pilgrimage, teeming with shrines and temples, a vast and much-sought burial-place;' in the whole place 'there seems to have been nothing but temples and tombs.'

See Stephens's *Incidents of Travel in Central America, &c.*, and Catherwood's *Views of Ancient Monuments, &c.*; Charnay's *Ancient Cities of the New World* (Eng. trans. 1887); also La Rochefoucauld, *Palenque et la Civilisation Maya* (Paris, 1888).

Palermo, formerly the capital of Sicily, now in point of population the fifth city of Italy, an archbishopric, and a seaport. It stands in the north-west corner of the island, on a bay that faces east, and at the mouth of a fertile valley called the Conca d'Oro ('Golden Shell'), 120 miles by rail W. of Messina, and occupies a picturesque site, being backed by mountains—on the north by Mount Pellegrino, with a (pilgrimage) grotto chapel (1624) to St Rosalia, whose festival is one of the great annual events of the city. The streets are for the most part handsome, and there are many fine old houses. The oldest public buildings date from the Norman period, and belong to two styles of architecture—Saracen and Byzantine. The most conspicuous of them all is the cathedral of St Rosalia, built (1169–85) by an Englishman, Archbishop Walter; it contains sepulchral monuments to Roger I., the emperors Henry VI. and

Frederick II., and in the crypt the tombs of the archbishops. Others to be named are the chapel (1143) in the royal palace, with magnificent mosaics; the Norman hall, in the same pile; and the churches of Martorana (with fine mosaics), St John of the Hermits (1132), and St Cataldo; and the mansions of Ziza, Cuba, La Favara, and Minnerno, all outside the city. There are close upon three hundred churches and chapels in Palermo. The royal palace, built by Roger I., is principally of Spanish construction; in it Piazzì established his observatory. The other public buildings—archbishop's palace, town-house, law-courts, university, arsenal, &c.—do not call for particular mention. The university (1447) has 70 teachers and 1100 students, with schools of engineering, fine arts, conveyancing, &c. There are also a national museum, the town library (1775) with 141,000 vols. and 2640 MSS., and the national library (1804) with 110,000 vols. and 12,000 MSS. Industry is little developed; machinery, essences, sumach, turnery, iron-founding, books, gloves, and shoes represent almost the only branches. But Palermo is an important seaport, with a large, though not growing, trade. Oranges, lemons, dried fruits, sumach, tartar, grain, oils, manna, sulphur, wine, animal produce, and lemon-juice are the principal exports, and average £1,457,700 per annum. The imports—grain and vegetables, cottons and woollens, coals, live-stock, iron, timber, groceries, silk, hides, petroleum, machinery, linen, metals, and glassware—fell from £1,439,515 in 1887 to £732,167 in 1889. The bulk of this trade is with Great Britain, France, and the United States. There is also a coasting trade—imports, from 3 to 3½ millions sterling; exports, about 1 million sterling. Some 3500 vessels of 1,200,000 tons enter every year, an average of 430,000 tons being British and 685,600 tons Italian. Pop. (1881) 205,712. The first we know of Palermo, the ancient *Panormus*, is that it was a Phœnician city, and the stronghold of Carthage in Sicily. It was conquered successively by Pyrrhus (276 B.C.), the Romans (254 B.C.), the Vandals (440 A.D.), Belisarius (535), the Saracens (835), the Pisans (1063), and the Normans from Apulia (1071). Henceforward it was the capital of the kingdom of Sicily (q.v.), first of the Norman kingdom, then of that of the Angevins and their Spanish successors. It suffered severely from earthquakes in 1693, 1726, and 1823. The city revolted against the Bourbon kings of Naples in 1820 and 1848, and was freed from them in 1860 by Garibaldi. But since then it has been only a provincial capital.—The province of Palermo has an area of 1985 sq. m. and a pop. (1889) of 774,070.

See the excellent guidebook of Gaell Fels; Morsø, *Descrizione di Palermo Antico* (1827); Schubring, *Historische Topographie von Panormus* (1870); Springer, *Mittelalterliche Kunst in Palermo* (1869); Holm, *Studii di Storia Palermitana* (1880); Freeman, *Historical Essays* (3d series, 1879), and his *History of Sicily* (1891).

Palestine.—I. *History.*—The name of Palestine is an illustration of the part taken for the whole. In the song of Moses (Exod. xv. 14) sorrow falls upon Palestina, and amazement upon Edom at the coming of Israel. Palestine was to Moses as it was afterwards to Isaiah and to Joel, to Herodotus, to the Greeks, the Egyptians, and the Assyrians, to Josephus and to Jerome, simply the Plain of Philistia, the broad slip of coast inhabited by the Philistines. Milton restricts the word to this sense. The country has received various names at different times, with all of which we are familiar. It has been called Canaan, or the Land of Canaan, the Land simply, the Land of Israel, the Land of Promise, and the Holy Land, a name which, in the words of Quaresmius, 'though of later date than

the rest, yet in excellency and dignity surpasses them all.'

The nations inhabiting this country at the time of the Conquest were, according to the list generally given, six in number. A seventh nation is added in one or two lists. These nations were the Canaanites, the Hivites, the Hittites, the Amorites, the Perizzites, and the Jebusites. The seventh were the Girgashites. The Canaanites—'lowlanders'—occupied the country east and west of the highlands—that is to say, the seaboard and the valley of the Jordan; the Hittites, a branch of the great kingdom whose extent and history are only now beginning to be recovered, dwelt in what was afterwards Judea, the Hivites in Samaria, the Perizzites in Galilee, the Amorites in the north, the Jebusites in and around Jerusalem. Of the Girgashites nothing is known. Other tribes there were—those of Moab, Ammon, Midian, and Edom on the east of Jordan, all of Semitic descent; the tall races—Rephaim, Zuzim, and Anakim; the Horim cave-dwellers; and there were the Amalekites, who defended the mountain-passes near Sinai, and the Philistines, of Egyptian origin; in later times they were called Cherethites, and at this day there is a village in Philistia called Keretiya.

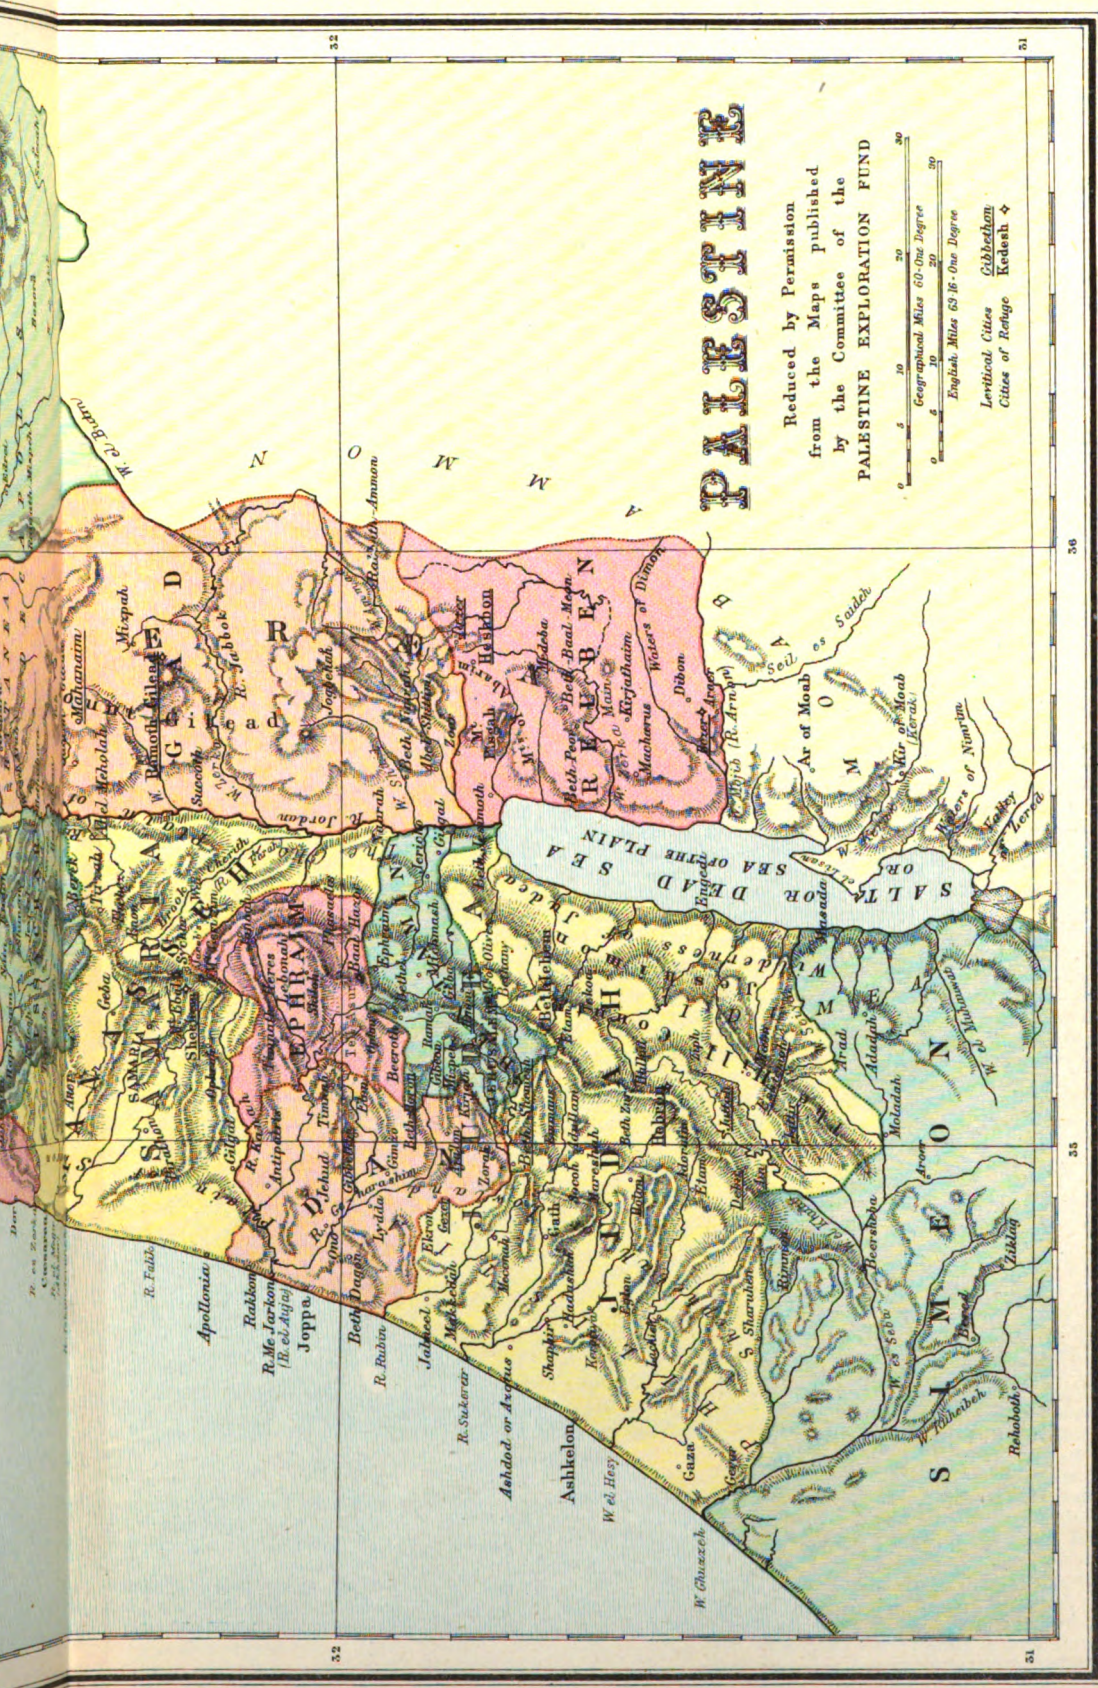

The flood of conquest rolled over these tribes. When the invaders had settled down within the boundaries allotted to them, we find them fighting for their new possessions, being driven back in consolidating their position. The conquered people were nowhere exterminated: the Jebusites held their own in Jerusalem, the Amorites in Ephraim; the Philistines took and lost and retook Gaza and Ascalon. There are many who regard the fellaheen of modern Syria as the direct descendants of the Perizzite, the Amorite, and the Hivite.

How long the Israelite tribal distinctions were kept up it is difficult to say. We find them strongly marked in the early history, but they grow fainter in the later books. It is not without significance that Solomon's twelve provinces corresponded mainly with the twelve tribes. During the term covered by the Book of Judges and part of Samuel there was no capital city and no central authority. The religious centre was shifted; the ark rested at Shiloh, at Nob, at Gibeon, and at Bethel. Jerusalem became the capital of David and Solomon, but on the foundation of the northern kingdom Shechem, Tirzah, and Samaria became successively its capital.

When the Jews returned from the great Captivity they occupied a territory extending from Jerusalem in the north to Beersheba in the south, and from Jericho in the east to Lachish in the west. The Philistines remained in undisturbed possession of their lands; the Idumeans were driven back to their deserts; on the north were the hostile Samaritans.

The Maccabean struggle for independence—a part of history which finds few students, yet a struggle heroic in its conduct and stupendous in its results—preserved the national existence. That there were Jews in the time of Herod, that there are Jews still, is due to the heroism of the immortal brothers.

The kingdom of Herod the Great covered the whole country divided into tribes by Joshua, with the exception of a small portion in the south-west and the tribe of Asher in the north. West of Jordan it contained Galilee, a province unknown by that name to the Old Testament; Samaria, also unknown before the Captivity; Judea and Idumea; east of the Jordan it contained Peræa, Gaulonitis, Auranitis, and Trachonitis—the ten cities of the Decapolis belonged partly to Peræa and partly to Gaulonitis. Of these provinces the most fertile and the most densely populated was

Galilee. He who takes the trouble to examine the large map of the Palestine Exploration Fund and to compare with it the statements made by Josephus will be astonished at the overwhelming evidence of a vast population and of exuberant fertility. Nowhere else in the country are there so many ruins of ancient towns; on every hill-top in a country which is a succession of hills is a Khurbet or ruin; springs abound; there are the traces of ancient terraces on the hillsides, extensive heaps of pottery, ancient cemeteries, broken oil-presses, groups of rock-hewn cisterns; proofs on all sides of the ancient prosperity.

This period of prosperity, encouraged by the Roman rulers, was destroyed by the madness of the Jews themselves. It vanished with the campaign of Vespasian and with the destruction of the temple by Titus. Even these rude lessons failed to quell the fiery spirit of the people. A second time they rose in revolt, not only in Judæa, but also in Egypt, Cyrene, Babylonia, Cyprus, and Mesopotamia. They were subdued. But again, when Hadrian endeavoured to suppress altogether this turbulent Judaism, there followed a rising, the wildest, the most blood-thirsty of all the Jewish revolts. It was led by Bar-Cochba (q.v.), 'Son of the Star,' the pretended Messiah, whose pretensions were recognised by Akiba (q.v.) himself, most learned of all the Jewish doctors. The rebellion was followed by a siege of Jerusalem, concerning which history is almost silent. It was probably marked by all the horrors which belong to the siege by Titus. The last stand was made at the fortress of Bether, when Bar-Cochba with an immense number of his followers was slain.

Then for a period Jerusalem vanishes from history. It is *Ælia Capitolina*; a temple of Jupiter was erected on the site of Herod's temple; no Jew was allowed to appear even within sight of the Holy City. Outside, for the next hundred years, though persecutions raged, the progress of Christianity was rapid and continuous; pilgrimages began to the holy places, and as a natural consequence

the Holy Land in a continual state of unquiet. The Samaritans gave trouble from time to time by murdering Christians; they were quieted in the usual manner, 'by punishment.' All Syria became a nest of monasteries, nunneries, and hermitages. In order to build their monasteries the old synagogues, the old fortresses, were destroyed and their stones used again. In every cave was a recluse; on every hillside lived a hermit; some erected lofty pillars and lived upon the top for all to see; the discovery of relics, holy bones, and holy places went on without interruption. Day and night, it is said, the air resounded with litanies. In a word, the land was given over to monks, for whom the country-people—the descendants of the Perizzites and the Amorites—tilled the fertile soil, grew the corn, pressed the oil, and made the wine.

Then King Chosroes, the Persian, marched into Syria (614 A.D.). The Jews, who had been quiet, but were neither dead nor converted, raised their heads in hope and gladly joined his victorious army. What the Persians did in the country itself may be guessed from the fact that in Jerusalem alone they massacred 90,000 Christians (the number may be taken as indicating a gigantic slaughter) and destroyed the whole of the buildings. When they retreated they left behind them along the broad track of their march ruined churches and monasteries destroyed by hundreds, with thousands of dead Christians to rejoice the eyes of the Jews who followed in the train. Fifteen years later Heraclius reconquered the province of Syria. The ruined churches were partly restored, the monasteries partly rebuilt. But for six years only, for then followed an enemy worse than Chosroes, because, though the Persian destroyed, he went away. The new-comer came to stay. In the year 636 A.D. the calif Omar with his Moslems took Jerusalem and proceeded to reduce the whole of the country, which indeed offered no resistance. After three hundred years of the ecclesiastics followed four hundred years of the Moslems. Jew and Christian were alike tolerated; the latter with a

little less contempt than the former. Early in this period the Dome of the Rock ('Mosque of Omar'), the most beautiful building in the world, was erected for Abd el Melek by Byzantine architects. The church of the Holy Sepulchre, or the group of churches bearing that collective name, was completed and beautified. We hear nothing more, however, of the monks. They disappeared at the first approach of the Moham-medans, and were no more seen. Except for the invasion, in 1244, by the Chorasmians (or Kharizmians; see KHIVA), then followed a period of peace for the country. It was also a period of continual pilgrimages. Men from all parts of western Europe visited the country, and knelt weeping at the places which had seen the sufferings of the Lord. And year by year while men related how these places where miracles were

wrought daily were in the hands of the infidels, who cursed and reviled the Christian pilgrims, the indignation grew until the world was ripe for the Crusades.

The Latin kingdom of Jerusalem began in the year 1099, and lasted less than a hundred years, except in name. But it took two hundred years before the Christians were finally driven from the coast of Syria, and longer than that before the

Mosque of Omar, Jerusalem.

more holy places were discovered every day. After the conversion of Constantine, the finding of the Cross, and the building of the church of the Holy Sepulchre, the history of Palestine becomes for three hundred years ecclesiastical. The country was all the time a battlefield, but the weapons were tongues and pens, and the missiles were words and arguments. Arius, Pelagius, and other persons of curious and questioning disposition kept

great idea of the Crusades (q.v.) finally faded out of men's minds, and ceased to be a factor in European politics.

For five hundred years Palestine has been so far happy that she has contributed little to the history of the world. The Turk succeeded the Saracen; there has been no progress till the present generation; the ruins have become more ruinous; pashas come and go; the people are oppressed with taxes; the young men are taken for soldiers, and they never come back; but the country has been for the most part in peace.

II. *Physical Description of the Holy Land.*—

Palestine proper contains an area of about 6000 sq. m. It is bounded on the N. by the river Kasimtyeh (the 'divider'), which is never mentioned at all in the Bible; on the E. by the Jordan, and on the W. by the sea. At first sight the map shows ridge upon ridge of hills running east and west, sloping gradually to the west, and descending steeply to the east. On the west is a long strip of low seaboard varying in breadth, vanishing altogether at the foot of Carmel, and broadening southward into the Plain of Philistia. The Bible speaks of the country as consisting of desert, mountain, plain, low hills (Shephelah), and valley. In North Galilee the watershed runs at an average height of 2800 feet above the sea, while the highest peak rises to a height of 3934 feet. In Samaria the hills are lower, not rising above 3000 feet, while south of Jerusalem the hills again rise to over 3300 feet. The north country contains the Plains of Buttauf and the rich plain of Esdraelon, 20 miles long and 9 miles broad, elevated, at its highest point, 250 feet above the sea. The principal elevations in the country are Jebel Jermuk, 3934 feet; Carmel, 1740 feet high and 12 miles long; Mount Ebal, 3084 feet, and Mount Gerizim, 2849 feet; Tell Asûr, 3318 feet; and Râs esh Sherifeh, 3258 feet, the only known spot whence the Dead Sea and Mediterranean Sea are visible. The Maritime Plain, formed partly by the denudation of the mountains and partly by accumulation of sand, possesses a fertile soil; deep gullies run across it, with, in some cases, perennial streams. The Jordan Valley begins with the rise of the stream 1000 feet above the Mediterranean, and in 100 miles has fallen to 1292 feet below the Mediterranean. This is a drop of nearly 2300 feet, or 23 feet in a mile. The valley itself varies in width from 5 miles, where it begins, to 13 miles in the Plain of Jericho. The country terminates southward with the Jeshimon, the 'Solitude' of the Old Testament or the 'Wilderness of Judæa' of the New, a plateau of white chalk rising in cliffs 2000 feet high above the Dead Sea.

Palestine is poorly supplied with rivers. The following, large and small, flow into the Mediterranean: The Nahr Mefshukh, Nahr Namein (the Belus), Nahr el Mukatta (the Kishon), Nahr el Zerka, Nahr el Mefjir, Nahr Iskanderûneh, Nahr el Falik, Nahr el Aujeh, Nahr Rubin, Nahr Sukereir. The following are the sources of the Jordan: Nahr Bareighit, Nahr el Hâsbany, Nahr el Leddân, Nahr Banias. On the eastern side, not counting a few winter rills which run into the Sea of Galilee, there are the Nahr Yarmuk, Nahr Rukkad, Nahr Zerka (the Jabok), Nahr Zerka Ma'ain, and Nahr Mojib (the Arnon). Those which flow into the Jordan on the west side are Nahr Jalid and Nahr Far'ah. The country is not, therefore, plentifully supplied with streams. On the other hand, it is a country abounding in springs. The three lakes of Huleh, Galilee, and the Dead Sea are its only lakes.

The climate of Palestine is extremely hot in summer, when the temperature reaches 100° F., and in winter it is wet and cold, though frost does not occur on the plains. There are heavy dews.

The 'former rain' and the 'latter rain' are those which occur at autumnal and vernal equinoxes.

The fauna and flora of Palestine have been treated exhaustively by Canon Tristram. The distinctive trees of the country are the terebinth, the olive, the cedar, and the sycamore. The shittim-wood is supposed to have been the acacia. The vine of Sodom is the osler, which has a fruit like a lemon, containing pith. The rose of Sharon is a white narcissus; and the lily of the valley is the blue iris.

Many of the names of creatures mentioned in the Bible have been so translated in the old version as to convey quite a false impression. Thus, the 'unicorn'—*rim*—was a species of wild-ox now extinct. This is shown by the Assyrian bas-reliefs. The 'hart' is the fallow-deer; the 'coney' is not the rabbit, but the Syrian hyrax; the 'leopard' is the cheetah; the 'fox' is the jackal; the 'mouse' is the jerboa; the 'weasel' is the mole-rat; the 'badger' is the porpoise. The leviathan is probably the crocodile, still found in one or two of the rivers. The wild-goat—*ibex*—is still found in large herds in the southern wilderness; the lion is extinct; the bear lingers in the mountains; the hyæna is common; the wolf is rare; the dog is an unclean creature living in the outskirts of towns, and feeding on garbage. Of birds, many mentioned in the Bible cannot be identified. All those which can be identified are still to be found. Of insects, the locust still devastates the crops; the grasshopper still serves for food; the hornet and the wasp are still regarded with terror; and the worship of the 'lord of flies' is still explained by the multitudes of those insects in the lowlands.

Geology.—In no other country are the physical features more indicative of the geological structure than in Palestine; and every student of the history of this remarkable country will recognise the important bearing which these features have had on the political and religious history of its inhabitants. The region is physically divisible into four parts: (1) The maritime district, extending along the shore of the Mediterranean, and including Philistia; (2) the central tableland or 'hill-country' of Judæa, culminating in the Lebanon towards the north and spreading out into the great plain of the Badiet-et-Tih in an opposite direction; (3) the depression of the Jordan Valley and Dead Sea, separating Eastern from Western Palestine; and (4) the tableland of Edom, Moab, and the region of Trachonitis to the east of the Jordan Valley, bounded by an abrupt and lofty escarpment, and stretching away towards the east into the Desert of Arabia. Taking these divisions in the order here stated, their geological structure may be briefly described as follows:

(1) The maritime district, having an average elevation of about 200 feet above the sea, is formed of marls, sand, and gravel, with shells belonging to species now living in the adjoining seas. These deposits are, in fact, the upraised sea-beaches belonging to geologically recent times, and indicate considerable physical changes at a period partially prehistoric. These littoral deposits rest upon calcareous sandstones of perhaps Miocene age, which terminate inland along the borders of the central tableland. (2) This latter is composed of lime-stones and marls, of Cretaceous and Eocene age, with bands of marl and layers or nodules of chert; the whole having a thickness of about 3500 feet. The beds rise from beneath the calcareous sandstone of Philistia, and form a vast crenelated arch, the central axis of which passes in a meridional direction under the summit of the tableland, where the strata are nearly horizontal; and upon which are the sites of Nablûs, Jerusalem, Bethlehem, and Hebron. Fossils in these strata

are only locally abundant, but are quite sufficient to enable us to refer the beds either to the Cretaceous or Eocene periods. (3) The great depression of the Jordan Valley and Dead Sea, known as the Ghôr, lies along the line of a great fault, or dislocation of the strata, owing to which the strata do not correspond to each other on opposite sides of the valley, but are vertically displaced; being let down on the west and elevated along the east. The fault has been traced southwards along the eastern margin of the Wâdy-el-'Arabah, and in Palestine its position is marked by the abrupt uprising of the tableland along the eastern side of the Jordan Valley and the Ghôr. The valley itself on either side is often diversified by terraces of marl, sand, and gravel, with lacustrine or fluviatile shells, and of rock-salt along the western margin of the Dead Sea. These terraces are at various levels above the present waters of the valley, and reach to a height of about 1200 feet above the Dead Sea surface in the 'Arabah Valley. As they are clearly lake-deposits they indicate that the waters of the Dead Sea once rose to a level of 1200 feet higher than at present, thus forming a lake which must have had a length of 120 miles from north to south, embracing the Sea of Galilee and the Jordan as far as the lake of Huleh. The remarkable promontory called El Lissan (or 'The Tongue'), which juts out into the Dead Sea from the base of the Moabite escarpment, as well as the corresponding terrace of rock-salt capped by gypseous marl on the west side of the Dead Sea, are portions of a once continuous bed of this more ancient and vastly more extensive inland lake. (4) Along the east of the Jordan Valley and Dead Sea the base of the Cretaceous limestone is seen reposing upon variegated sandstone, known as the 'Nubian Sandstone' of Lower Cretaceous age; and this again on various crystalline rocks, such as granite, gneiss, porphyry, and schist, of great geological antiquity. Of these rocks the flanks of the Edomite Mountains are composed, as well as those forming the Sinaitic peninsula. In the valley of the Nile the same series reaches the surface at the First Cataract, and is seen to pass below the Nubian sandstone. Everywhere these crystalline rocks are the foundation of all the geological formations of this region, and have been referred to the Archæan or Laurentian period. The Cretaceous and Eocene limestones form the surface of the tableland of Edom and Moab, and extend eastwards under the great elevated plain of the Arabian Desert, a counterpart of the Libyan Desert west of the Nile. From the neighbourhood of Kerak northwards these limestone strata are intersected or overlaid by dykes and sheets of basalt, which form the region of Trachonitis east of the Sea of Galilee, and which have been poured forth from volcanic vents and fissures in the region of the Haurân. Some of the volcanic cones and vents are remarkably perfect and fresh—resembling those of the Auvergne region in central France, both having been developed in Post-Tertiary times; and it is not improbable that some of the hot springs which issue forth along the line of the Jordan owe their high temperature to the proximity of the underground waters to the still heated masses of lava beneath the surface.

In the Lebanon and Hermon the Cretaceous and Tertiary limestones are thrown into numerous flexures, and are repeated by successive faults, amongst which the most important is the prolongation of the Jordan Valley fault, which, judging from indications which have been observed, appears to be continued along the valley of the Orontes.

III. *The Exploration of the Country.*—The stream of pilgrims to the Holy Land began in the 2d century, and has never since then ceased. This stream rose to its highest flood in the century

before the Crusaders, when the Mediterranean was covered with ships conveying the pilgrims to the shores of the Holy Land, and the roads were black with the troops of those who walked or rode through Europe and across Asia Minor. Those of them who returned in safety told what they had seen. Some of them wrote descriptions of the Holy Land. Thus, in the 4th century, a pilgrim from Bordeaux, who visited the country when Constantine's basilica was being built, wrote an account of his journey. In the same century Eusebius produced an *Onomasticon* or gazetteer of the Holy Land. Later on Jerome, Eucherius, Theodorus, Antoninus Martyr, Procopius, before the Mohammedan conquest, wrote accounts of the country and of Jerusalem. After the conquest the pilgrims were allowed to come and go unmolested. Arculphus, Willibald, Bernard, and others have left descriptions which belong to the 7th, 8th, and 9th centuries. Moreover, the Moslems themselves began to write. About 985 El Mukaddasi, 'the man of Jerusalem,' described the whole of Syria. A few years later Nâzir-i-Khusrau wrote an account of his journey from Balkh, through Armenia and Palestine to Cairo, thence to Mecca, through Persia, and so back to his native town. The Crusaders have left copious accounts of their wars, their occupations, and their customs, while the descriptions and narrations of pilgrims who wrote in Latin, French, Russian, Greek, Hebrew, Persian, and Arabic throw floods of light on the country of this time. Maps began to be made; they lack the accuracy of later geographers, but they convey instruction as regards the land and its physical features, which is correct so far as it goes. Thus, the map of Marino Sanuto indicates the hill-country, the mountains of Libanus, the River Jordan, the Dead Sea, and the Sea of Galilee, and places the towns with a reasonable degree of accuracy. Palestine, therefore, though never explored, was tolerably well known to the world, as well known as Italy was formerly to the French or the Low Countries to the English. Modern exploration, with fuller knowledge of what was wanting, began in the 19th century with Seetzen, Burckhardt, Buckingham, Irby and Mangles, Tobler, De Saulcy, Van de Velde, and Williams.

The researches of Robinson and the immense additions made by him in the field of Biblical geography in the years 1838-52 forced upon the world the necessity for an exhaustive survey of the country. Robinson demonstrated the existence everywhere of ruined towns and hill-forts in which were preserved the long-lost names of Bible places. It became certain that a triangulation of the country, such as that of the Ordnance Survey of Great Britain and Ireland, which should leave not a corner of country, not a single hillock, unexplored, would be fruitful in results, and would furnish a map of such accuracy as to require no more books of travel for the elucidation of geographical points. Thus, the physical features of the country were already known in general terms, but the details were mostly unknown; while even the curious foot-steps of Robinson had left whole tracts of country totally unexplored. The foundation of the Palestine Exploration Fund (1865) was the first step taken in this new direction; but it shows how little the necessity for such a survey was impressed upon the minds even of its founders that they began, after a preliminary journey under Captain (Colonel Sir Charles) Wilson, by excavations in Jerusalem under Lieutenant (Colonel Sir Charles) Warren. It seemed at the moment more important to settle, if possible, the site of the temple than to make clear and intelligible the whole of the Bible narrative. For this and nothing short of this has been the result of the survey. This survey

has now been executed, chiefly by Major Conder, R.E., whose name will be indelibly associated with a work which has done so much for the right understanding of the Bible in the version into English. The whole of Western Palestine is now mapped on a scale which includes every ruin as well as every spring, every watercourse, every wood, and every hillock. At least 150 lost biblical sites have been recovered; by means of these the boundaries of the tribes can now be laid down; one-fourth only of the Bible names remain to be identified. The topography of Josephus, of the Talmud, of the pilgrims, and of the chroniclers has also been illustrated and recovered. All important heights have been ascertained; the levels of the Dead Sea and the Sea of Galilee are laid down; all the remaining ruins have been planned and drawn; the various forms of rock sepulture have been examined and classified; the rude stone monuments have been marked and planned; for the first time the route of invading armies can be followed, and the strategic art of the captains can be understood; native customs have been gathered; the seasons, the climate, the fauna and flora, the monuments, the inscriptions, the ethnology of the country and its people have all been collected. These things bring floods of light to bear upon the understanding of the Scriptures. Formerly the study of the Bible was confined to the books themselves and to the literature of exegesis which had gathered round these books. To this method we owe the immense mass of writings on the Bible, books which fill the greater part of our libraries, books of profound erudition from which scarcely anything can be gleaned for the instruction of the people. Now, however, there are new methods. We approach the Bible armed with coins, with inscriptions in cuneiform, in hieroglyphics, in Hebrew, Arabic, and in Greek; we have inscribed monuments, such as the Moabite Stone, the Siloam inscription, the stone of the temple; we have a map of the country accurate and exhaustive, a possession for all time, which will never need to be done again; we have measurements and plans of all the ruins; we have traditions, legends, languages, customs; we have, besides, for those who come after us, a great collection of inscriptions in unknown characters containing one knows not what ancient history. Lastly, which must not be omitted, everything which has been found, or which has been achieved, in the direction of scientific exploration goes to prove the literal exactness of the historical portions of the Old and New Testament.

The present condition of the country shows the beginning of rapid changes in every direction. The Survey of Palestine was undertaken not a day too soon. In a very few years the ruins which have been figured by the surveyors, and so, in a sense, preserved for ever, will have vanished under the destructive hands of Change. The thousands of visitors who every year pour into the country contribute in no small degree to alter the character, the habits, and the ideas of the people; roads are being everywhere constructed in a country where up till a few years ago there were no roads. The traveller can now drive from Jaffa to Jerusalem, from Jerusalem to Jericho, from Jerusalem to Hebron, and from Haifa to Tiberias. A railway is in construction between Jaffa and Jerusalem; plans and surveys of another from Haifa to Damascus, by way of Nazareth, are also ready; and there is now a hotel at Jericho. As regards Jerusalem, a new town has sprung up outside the walls; the Russians have buildings there which, on occasions, would serve for fortresses; the Jews are flocking into the city—it is rumoured that there are now close upon 50,000 Jews in and about the Holy City;

the Mount of Olives is being covered with buildings. There are Jewish colonies between Ramlah, Lydda, and Jaffa; there are German colonies in the same region; Circassians occupy Ammán, and are settling in the Haurán; the people from the Lebanon are coming down from their hills and covering the country east of the Jordan. In fact, those who wish to see Palestine as it has been for a thousand years and more must go at once or they will never have the chance.

BIBLIOGRAPHY.—The books published on Palestine are far too numerous to be set down. But the Survey has rendered most of them practically useless. All the books of travel of modern times may now be neglected; their results are embodied in the Survey. The *Survey of Western Palestine* consists of eight volumes—viz. vols. i. to iii. Memoirs, by Captain Conder and Captain Kitchener, with plans and drawings of most of the ruins; Jerusalem, by Sir Charles Warren and Captain Conder, with a portfolio of sixty sheets illustrating the excavations; the Fauna and Flora, by Canon Tristram; a volume of special papers on various subjects connected with the Survey; the Name-lists, containing all the names in Arabic with the English transliteration and the translation; and the Geology of Western Palestine, by Professor Edward Hall, F.R.S.; to which is added an index in one volume. The *Survey of Eastern Palestine* has been advanced one volume only. These volumes contain the facts necessary for the student. Should he only want the popular results he may read the works of Major Conder, *Tent-work in Palestine, Heth and Moab, Syrian Stone-lore*, or that of Mr H. A. Harper, entitled *The Bible and Modern Discoveries*. An excellent résumé of the Survey and of recent research is also contained in Conder's *Palestine*. A collection of early pilgrims is in course of publication by the Palestine Pilgrims' Text Society. The publications of the Société de l'Orient Latin may also be consulted. *Palestine under the Moslems*, by Guy le Strange (Palestine Exploration Fund), gives the world for the first time an historical and geographical account of the country compiled exclusively from Moslem writers. See also Fritz Burckhardt, *Reisen in Syrien und Palestina*; Oscar Fraas, *Aus dem Orient*; E. Hull, *Physical Geology and Geography of Arabia Petrea, Palestine, &c.* (Mem. Palestine Exploration Soc. 1890); Louis Lartet, *Voyage d'Exploration à la Mer Morte*; Canon Tristram, *Land of Israel* (2d ed. 1872). See, too, the article JERUSALEM, and works cited there; also JEWS, TEMPLES.

Palestine, capital of Anderson county, Texas, 151 miles by rail N. of Houston. It manufactures brass and iron goods, and has a pop. (1890) of 5834.

Palestrina, the ancient *Præneste*, an Italian city, 22 miles E. by S. of Rome, on the slope of an offset of the Apennines, contains the chief castle of the Colonnas and the palace of the Barberini family, the owners after 1630. It is built almost entirely upon the gigantic substructions of the ancient Temple of Fortune, one of the greatest religious edifices in all Italy, celebrated not only for its splendour, but also for its oracle, which was consulted down to the time of Constantine. Portions of the ancient wall—Cyclopean blocks of limestone—still remain. Præneste was a member of the Latin League, until in 499 B.C. it joined the Romans. Yet it took a prominent part in the Latin war (340–338 B.C.) against Rome. Having given shelter to the younger Marius in 82 B.C., it was taken and sacked by Sulla. Its elevated and healthy situation, at no great distance from the capital, made it a favourite summer-resort of the Romans. Augustus and Tiberius frequented it; Horace found it a pleasant retreat; Hadrian built there an extensive villa; and Antoninus erected a palace. Numerous valuable works of art and other remains have been recovered, dating principally from the 8th, and from the 3d and 2d, centuries B.C., the former showing Phœnician influence, the latter being Roman. Pop. 5855.

Palestrina, GIOVANNI PIERLUIGI DA, the greatest of Italian musical composers, was born at

Palestrina in 1524. He studied music at Rome under Goudimel, and in 1551 was made *maestro di capella* of the Julian Chapel of St Peter's by Pope Julius III. In 1554 he published a collection of Masses, which the pope so highly approved of that he appointed their composer one of the singers of the Sistine Chapel. Being a married man, he lost that office on the accession to the pontificate of the severer Paul IV. But in 1555 he was made choir-master of the Lateran, and in 1561 was given the similar post in St Maria Maggiore, and held it till 1571, when he was restored to his office in the Julian Chapel. The Council of Trent, having undertaken to reform the music of the church, entrusted to Palestrina the task of remodelling this part of religious worship. He composed three masses as examples of what could be done; one of them, the Mass of Pope Marcellus (to whose memory it is dedicated), saved music to the church by establishing a type infinitely superior, in its blending of devotional with artistic feeling, to anything that had preceded it, a type which, amid all the changes that music has since gone through, continues to attract admiration. Palestrina must be considered the first musician who reconciled musical science with musical art, and his works form a most important epoch in the history of Music (q.v.). He died in the arms of St Philip Neri on 2d February 1594. His compositions, very numerous, are all sacred, except two volumes of Madrigals; they have been published at Leipzig (1868 *et seq.*). The authoritative Life was written by the Italian Baini (Rome, 1828).

Paley, FREDERICK APTHORP, classical scholar, grandson of the author of the *Evidences*, was born at Easingwold, near York, in 1816. He had his education under Dr S. Butler at Shrewsbury, and at St John's College, Cambridge, but, not obtaining mathematical honours, by the regulations of the time was shut out from the classical tripos, and likewise did not obtain a fellowship. He resided, however, at Cambridge till his conversion to the Roman Catholic faith in 1846, and later from 1860 till 1874, when he was appointed professor of Classical Literature at the abortive Roman Catholic college at Kensington. He next went to live at Bournemouth, was twice classical examiner to London University and for the classical tripos at Cambridge, and continued till the sudden close of his life (11th December 1888) his arduous labours in classical scholarship. In early life at Cambridge he helped to found the Camden Ecclesiological Society, and published books on Gothic architecture; but the important work of his life began in 1844 with the first part of his edition of *Æschylus* with Latin notes. He re-edited *Æschylus* for the 'Bibliotheca Classica', as well as Euripides, Hesiod, the *Iliad*, and completed the *Sophocles* of Mr Blaydes, all for the same series; and also prepared minor editions of similar works, or parts of these, for the 'Cambridge Texts' series. His *Propertius*, Ovid's *Fasti*, and *Martial* were less successful; but his three comedies of *Aristophanes*, *Theocritus*, and his *Select Private Orations of Demosthenes* (in conjunction with Dr Sandys) were recognised as works of the very highest value. He published prose translations of the *Philebus* and *Theætetus* of Plato, the 5th and 10th books of Aristotle's *Ethics*, the *Odes* of Pindar, and the *Tragedies* of *Æschylus*, and renderings in verse of the 5th book of *Propertius* and *Fragments of the Greek Comic Poets* (1888). Other works were a treatise on *Greek Particles* (1881), *Greek Wit* (1881), and an unsatisfactory edition of the *Gospel of St John* (1887). Paley received the degree of LL.D. from Aberdeen in 1883. A sagacious textual critic and sound exegete, he left behind him traditions of a high type of scholarship, of the age

when yet scientific philology was not, and German might be neglected. In his later years he adopted a late date for Homer.

Paley, WILLIAM, a celebrated English divine, was born at Peterborough, son of a minor canon of the cathedral, in 1743. His family belonged to the West Riding of Yorkshire, and not long after his birth his father returned to his native parish of Giggleswick to become master of the grammar-school there. In 1759 he entered Christ's College, Cambridge, as a sizar, and led for the first two years an idle and dissipated life, but thereafter became a severe student, and in 1763 came out senior wrangler. After three years as an assistant-master at Greenwich, he was elected in 1768 a fellow and tutor of Christ's College, and here he lectured on moral philosophy till his marriage in 1776 and presentation to the rectory of Musgrove in Westmorland and the vicarage of Dalston in Cumberland, which were soon exchanged for the more profitable living of Appleby. In 1780 he was collated to a prebendal stall in Carlisle Cathedral, in 1782 he became archdeacon, and in 1785 chancellor of the diocese. In the latter year he published his *Principles of Moral and Political Philosophy*, for which he received £1000. In this work he propounds his ethical theory—a form of what is usually known as utilitarianism. He begins by adducing a series of strong objections against the popular doctrine of the *moral sense*, next takes up the question of the source of obligation, and resolves it into the will of God, enforced by future punishment, it being admitted candidly that virtue is prudence directed to the next world. The will of God, in so far as it is not rendered explicit by revelation, is to be interpreted by the tendency of actions to promote human happiness, the benevolence of the Deity being assumed. Objection may fairly be taken to the principles on which Paley rests his system, but the lucidity and appositeness of his illustrations are beyond all praise; and if his treatise cannot be regarded as a profoundly philosophical work, it is at anyrate one of the clearest and most sensible ever written, even by an Englishman. In 1790 appeared his most original work, *Horæ Paulinæ*, the aim of which is to prove, by a great variety of 'undesigned coincidences,' the great improbability of the common hypothesis of the unbelief of that day, that the New Testament is a cunningly devised fable. It was followed in 1794 by his famous *View of the Evidences of Christianity*, in which dexterous use is made of Lardner's *Credibility* and Bishop Douglas' *Criterion of Miracles*. The treatment is on the historical method, flanked by *auxiliary* arguments drawn from the superior morality of the gospel, the originality of Christ's character, and the like. But the bases of controversy have now entirely shifted, and the work, able as it is, is no longer, even at Cambridge, regarded adequate as a defence. The champion of the faith was splendidly rewarded. The Bishop of London gave him a stall in St Paul's; shortly after he was made subdean of Lincoln, with £700 a year; Cambridge conferred on him the degree of D.D.; and the Bishop of Durham presented him to the rectory of Bishop Wearmouth, worth £1200 a year. Perhaps his latitudinarianism and essentially unspiritual temperament, as well as such homely sarcasms as comparing the 'divine right of kings' with the 'divine right of constables,' may have hindered him from yet higher preferment. After 1800 he became subject to a painful disease of the kidneys, yet in 1802 he published perhaps the most widely popular of all his works, *Natural Theology, or Evidences of the Existence and Attributes of the Deity*, largely based on the *Religious Philosopher* of Nieuwentyt, a Dutch disciple of Descartes. An excellent edition is that by Lord Brougham and

Sir Charles Bell (1836-39). Paley died May 25, 1805.

A complete edition of his works was published by one of his sons, the Rev. Edmund Paley (7 vols. 1825); later editions are those by Wayland (5 vols. 1837) and Paxton (5 vols. 1838). The best biography is that by G. W. Meadley (Sunderland, 1809); and see Leslie Stephen, *English Thought in the Eighteenth Century* (1876).

Palghat, a town of Malabar district, 68 miles SE. of Calicut by rail. Its old fort was of great strategic importance during the wars with Hyder Ali and Tippoo Saib. Pop. (1881) 36,339.

Palgrave, SIR FRANCIS, historian, was born in London in July 1788, the son of Meyer Cohen, a Jewish stockbroker. He was privately educated, and showed a quite remarkable precocity, having at eight translated into French a Latin version of the *Battle of the Frogs and Mice*, which his father printed in 1797. His father's fortunes failing in 1803, he was articled as a solicitor's clerk, and here he remained until 1822, when he took chambers in the Temple and was employed under the Record Commission. On his marriage (1823) he assumed his mother-in-law's maiden name of Palgrave. He was called to the bar in 1827, and soon acquired considerable practice in pedigree cases before the House of Lords. As early as 1818 he had edited a collection of Anglo-Norman *chansons*; in 1831 he contributed a *History of England* to the 'Family Library'; and in 1832 he published his *Rise and Progress of the English Commonwealth*, also *Observations on the Principles of New Municipal Corporations*. The same year he was knighted. From 1833 to 1835 he served on the Municipal Corporation Commission, and in 1838, on the reconstruction of the Record Service, he was appointed deputy-keeper of Her Majesty's Records, an office he held till his death at Hampstead, 6th July 1861.

Besides the works already mentioned, Palgrave edited for the government the following: *Calendars of the Treasury of the Exchequer* (3 vols. 1836), *Parliamentary Writs* (1830-34), *Rotuli Curie Regie* (1835), *Ancient Calendars and Inventories of the Treasury of Her Majesty's Exchequer* (1836), and *Documents and Records illustrating the History of Scotland* (1837). In his private capacity he produced the *Merchant and the Friar* [Maroo Polo and Friar Bacon], and a learned and still valuable *History of Normandy and of England* (4 vols. 1851-64).

Palgrave, FRANCIS TURNER, a gifted poet and critic, eldest son of the preceding, born in London, September 28, 1824. He was educated at Charterhouse School, became scholar of Balliol College, Oxford, and Fellow of Exeter, filled for five years the office of vice-principal of the Training College for Schoolmasters at Kneller Hall, and afterwards was private secretary to Earl Granville, and an official in the Educational Department of the Privy-council. He succeeded Shaip as professor of Poetry at Oxford in 1886, and is a contributor to the present work. His works are *Idylls and Songs* (1854), *Essays on Art* (1866), *Hymns* (1867), *The Five Days' Entertainments at Wentworth Grange* (1868), *Lyrical Poems* (1871), and the *Visions of England* (1881). He is best known, however, as the editor of the admirably selected *Golden Treasury of English Lyrics* (1861); *The Children's Treasury of Lyrical Poetry* (2 vols. 1875); *The Sonnets and Songs of Shakespeare* (1877); *Selected Lyrical Poems of Herrick* (1877), of *Keats* (1885); and *Treasury of Sacred Song* (1889).

WILLIAM GIFFORD PALGRAVE, another son of Sir Francis, born in Westminster, January 24, 1826, was educated at the Charterhouse School and Trinity College, Oxford, graduating with great distinction in 1846. Next year he obtained a commission in the Bombay Native Infantry, which, however, he soon resigned to become a

priest in the Society of Jesus. After a course of study at Laval in France and at Rome he was sent at his own request as a missionary to Syria, where he acquired a wonderfully intimate knowledge of Arabic. Summoned to France in 1860 by Napoleon III. to give an account of the Syrian massacres, he went disguised as a physician on a daring expedition at the emperor's expense through central Arabia, traversing the entire Wahabi kingdom, and returning to Europe through Bagdad and Aleppo (1862-63). With the consent of the emperor, he published his *Narrative of a Year's Journey through Central and Eastern Arabia* (2 vols. 1865), one of the best books of travel in the English language. Palgrave quitted the Society of Jesus in 1864, and was sent by the British government in 1865 to treat for the release of Consul Cameron and the other captives in Abyssinia. He was nominated consul at Sukhum-Kalé in 1866, at Trebizond in 1867, at the island of St Thomas in 1873, at Manila in 1876, and consul-general in the principality of Bulgaria in 1878, and in Siam in 1880. He was appointed British minister to Uruguay in 1884, and died at Monte Video, September 30, 1888. His other works are *Essays on Eastern Questions* (1872); *Hermanns Agha: an Eastern Narrative* (2 vols. 1872); *Dutch Guiana* (1876); and *Ulysses, or Scenes and Studies in Many Lands* (1887).

Páli, the sacred language of the Buddhists (see INDIA, Vol. VI. p. 102). Páli ceased to be a living language of India when Buddhism was rooted out of it; it was carried by the fugitive Buddhists to other countries, especially Ceylon, Burma, and Siam; but in these countries, too, it had to give way before the native tongues, in which the later Buddhist literature was composed. See the Páli grammars of Minayeff (St Petersburg, 1872; Eng. trans. Maulmain, 1882), Kuhn (1875), and Müller (1885); Childers's *Páli Dictionary* (1875), and Frankfurter's *Páli Handbook* (1882).

Páli, the commercial capital of Jodhpur (q.v.), 45 miles by rail SE. of Jodhpur city.

Palikao, a place on the canal between Peking and its port on the Peiho. Here in 1860 was fought an engagement between the Anglo-French troops and the Chinese, and hence the French general, Cousin-Montauban (1796-1878), who was minister of War in August and September 1870, received his title of Count Palikao.

Palikars, a name for the Armatoles (q.v.).

Palimpsest. See PALEOGRAPHY.

Palindrome (Gr. *palin*, 'backwards,' and *dromos*, 'a running'), the name given to a kind of verse very common in Latin, the peculiarity of which is that it may be read the same backwards as forwards. A few examples will suffice.

Si bene te tua laus taxat sua lautè tenebia.
Et necat eger amor non Roma rege tacente,
Roma reges una non anus eger amor.

A Greek palindrome, sometimes inscribed on English fonts (e.g. Hadleigh and Worlingworth, in Suffolk), runs: *Νίψον ἀνδρῆμα μὴ μύσαν σῆμα* ('Wash my sin, and not my face only'). A Roman lawyer gets the credit of *Si nummi immunia*, which Camden translates 'Give me my fee, and I warrant you free.' It is said that in the reign of Queen Elizabeth a certain lady of rank, having been compelled to retire from the court on account of some *fama*, the truth of which she denied, took for her motto: *Ablata at alba*, 'Retired but pure.' The English language has few palindromes, but one at least is inimitable. It represents our first parent politely introducing himself to Eve in these words: 'Madam, I'm Adam.' Compare Henry B. Wheatley's book

on *Anagrams* (1862); G. R. Clark, *Palindromes* (Glasgow, 1887).

Palinurus, the helmsman of Æneas, was lulled to sleep at his post, and fell into the sea. When Æneas visited the lower world he related to him that on the fourth day after his fall he made the coast of Italy, and was there barbarously murdered, and his body left unburied on the strand. The Sibyl prophesied that his death should be atoned for, a tomb erected to him, and a cave (Palinurus, the modern *Punta della Spartivento*) named after him.

Pallsander Wood, a name sometimes given to Rosewood (q.v.).

Palissy, BERNARD, the great French potter, was born about 1509 in the diocese of Agen, and, after wandering for ten or twelve years all over France as a glass- and portrait-painter, about 1538 married and settled at Saintes. There he employed himself also as a land-surveyor, when the chance sight of an enamelled cup made him resolve to discover how to make enamels. So, neglecting all else, he devoted himself to experiments for sixteen years, by which time he had exhausted all his resources, and, for want of money to buy fuel, was forced to burn the tables and the flooring of his house. His neighbours, even his wife, mocked at him; his children cried to him for food; but in spite of all these discouragements he persisted, and was at length rewarded with success (1557). His ware, bearing in high relief plants and animals, coloured to represent nature, soon made him famous; and, though as a Huguenot he was in 1562 imprisoned at Bordeaux, he was speedily released by royal edict, and appointed 'inventor of rustic figulines' to the king. Removing to Paris in 1564, he established his workshop at the Tuileries, and was specially exempted by Catharine de' Medici from the massacre of St Bartholomew (1572). During 1575-84 he delivered a course of lectures on natural history and physics, and was the first in France to substitute facts for fancies, as also to give right notions of the origin of springs, the formation of fossil shells, the fertilising properties of marl, and the best means of purifying water. In 1585 he was again arrested as a Huguenot, and thrown into the Bastille, where he died in 1589. Palissy's writings, published between 1557 and 1580, and edited by M. France (Paris, 1880), possess much interest; but the man himself is more interesting still, brave, ardent, sincere, a mixture of Columbus and John Bunyan.

See H. Morley's *Palissy the Potter* (2 vols. 1852), and the *Lives* in French by Audiat (1868) and Berty (1886).

Palurus, a genus of trees and shrubs of the natural order Rhamnaceæ, nearly allied to *Zizyphus* (see *JUJUBE*), but very different in the fruit, which is dry, orbicular, and girded with a broad membranous wing. *P. aculeatus* is often called Christ's Thorn, and by the Germans Jews' Thorn (*Juden-dorn*), from the fancy that it supplied the crown of thorns with which our Saviour was crowned. It is a deciduous shrub or low tree, with slender, pliant branches and ovate three-nerved leaves, each of which has two sharp spines at the base, one straight and the other re-curved. It is a native of the countries around the Mediterranean, of India, and many parts of Asia. It is often used for hedges in Italy and other countries, its sharp spines and pliant branches admirably adapting it for this purpose.

Palk Strait, the northern portion of the shallow passage between the south coast of India and the island of Ceylon (q.v.).

Palladio, ANDREA, Italian architect, was born at Vicenza, 30th November 1518. After studying

the writings of Vitruvius and the monuments of antiquity at Rome, he settled in his native city, and soon acquired a high reputation throughout the country from his designs for numerous buildings in Vicenza and the neighbourhood. He is the most conspicuous of the architects who, following Brunelleschi, led the way in establishing the modern Italian school of architecture, as distinguished from the earlier Italian Style (q.v.) of the Renaissance. His style, known as the Palladian, is modelled on the ancient Roman as apprehended by Vitruvius, reproducing its dignity and strict proportions, but often to the neglect of usefulness; and his buildings are constantly encumbered by a superfluity of pilasters and columns, broken entablatures, and inappropriate ornament, even where there is real beauty of detail. The palaces Barbarano, Della Ragione, Chierigati (now the Museo Civico), Tiene, and the Olympic theatre at Vicenza; the country mansions of Capra, Maser, and Rotunda in the vicinity; and the churches of San Giorgio Maggiore and Il Redentore, the façade of San Francesco della Vigna, and several palaces, in Venice, are his greatest achievements. He died at Vicenza, 19th August 1580. Palladio wrote a work on architecture (*I quattro Libri dell' Architettura*, 1570, and often reprinted) which had a great influence upon the styles of his successors, especially upon Inigo Jones, the 'English Palladio,' whose notes on the book are published in Leoni's Eng. trans. (1715). The term Palladian was, indeed, long practically synonymous with the beautiful and perfect in architecture. Recent *Lives* (in Italian) are those by Zanella (1880) and Barichella (1880).

Palladium, among the ancient Greeks and Romans, an image of Pallas, who was generally identified with Athena (q.v.), upon the careful keeping of which in a sanctuary the public welfare was believed to depend. The Palladium of Troy was especially famous, and was the gift of Zeus to the founder of Ilium. It has been supposed it may have been originally a meteorite (see *METEORS*). Ulysses and Diomedes stole the Palladium, and so helped to secure victory for the Greeks; and both Athens and Argos boasted to have afterwards secured the possession of the charm.

Palladium (sym. Pd, atom. wt. 106.2, sp. gr. 11.4) is one of the so-called noble metals, which in its colour and ductility closely resembles platinum. It is not fusible in an ordinary wind-furnace, but melts at a somewhat lower temperature than the last-named metal; and, when heated beyond its fusing-point, it volatilises in the form of a green vapour. It undergoes no change in the open air at ordinary temperatures; but at a low red heat it becomes covered with a purple film, owing to superficial oxidation. It is soluble in nitric and iodic acids, and in aqua regia. It combines readily with gold, which it has the property of rendering brittle and white. (When it forms 20 per cent. of the mass the alloy is perfectly white.) When alloyed with twice its weight of silver it forms a ductile compound, which has been employed for the construction of small weights; but for this purpose aluminium is superior. Professor Miller states that it 'has been applied in a few cases to the construction of graduated scales for astronomical instruments, for which, by its whiteness, hardness, and unalterability in the air, it is well adapted; its scarcity must, however, prevent its general use for this purpose.'

It was discovered in 1803 by Wollaston in the ore of platinum, of which it seldom forms so much as 1 per cent. Another source of this metal is the native alloy (termed *ouro poudre*) which it forms with gold in certain mines in Brazil; it is from this alloy that the metal is chiefly obtained.

Palladium forms with oxygen a protoxide, PdO , which is the base of the salts of the metal; a binoxide, PdO_2 ; and according to some chemists, a suboxide, Pd_2O . On exposure to sufficient heat these compounds give off their oxygen and yield the metal. The salts of the protoxide are of a brown or red colour.

Palladius, **RUTILIUS TAURUS ÆMILIANUS**, a Roman author of the 4th century A.D., who wrote a work, *De Re Rustica* (On Agriculture), in fourteen books, the last of which is a poem of eighty-five elegiac couplets.

Palladius, **St.** See **SCOTLAND (CHURCH OF)**.

Pallas. See **ATHENA, MINERVA**.

Pallas, **PETER SIMON**, traveller and naturalist, was born 22d September 1741, at Berlin, studied medicine and natural history at Berlin, Göttingen, and Leyden, and, already famous, was in 1768 invited to St Petersburg by the Empress Catharine. Appointed naturalist to a scientific expedition to observe the transit of Venus, he spent six years (1768-74) exploring the Urals, the Kirghiz Steppes, part of the Altai range, great part of Siberia, and the steppes of the Volga, returning with an extraordinary treasure of specimens in natural history. He wrote a series of works on the geography, ethnography, flora and fauna of the regions visited. He settled in the Crimea in 1796, and there he died, 8th September 1811.—The Sand-grouse (q.v.) is often called Pallas's Sand-grouse.

Pallavicino, **SPORZA**, an Italian historian, was born at Rome, 20th November 1607. Having taken priest's orders in 1630, he became in 1638 a member of the Jesuit Society, and was created a cardinal in 1659 by Pope Alexander VII. He died at Rome, 5th June 1667. The best known of his writings is *Istoria del Concilio di Trento* (Rome, 1656-57), intended as a reply to the equally celebrated and liberal work of Paul Sarpi, whose narrative is not altogether acceptable to Catholics.—**FERRANTE PALLAVICINO** (1618-44) wrote pasquinades which bitterly offended the papal curia and the Barberini family; and being betrayed into his enemies' hands near Avignon, he was tried, condemned by a foregone conclusion, and beheaded.

Pallice, **LA**, a new harbour opened (1889) to receive large transatlantic and other ocean-going vessels bound for La Rochelle in France, whence it is less than 3 miles distant. It consists of an inner basin 28½ acres in extent and an outer harbour protected by two moles, each 1380 feet long.

Palliser, **SIR WILLIAM, C.B.**, was born at Dublin on 18th June 1830, and entered the army as a cavalry officer. In 1863 he invented the chilled shot (see **SHELL**) that bears his name, and a system of strengthening cast-iron ordnance by the insertion of a steel tube. He retired in 1871, sat for Taunton as M.P., and died 4th February 1882.

Pallium, the name given in the Roman Catholic Church to one of the ecclesiastical ornaments worn by the pope, by patriarchs, and by archbishops. It is worn by the pope at all times, as a symbol of his reputed universal and abiding jurisdiction. By archbishops it cannot be worn until it has been solemnly asked for and granted by the pope, and even then only during the solemn service of the great church festivals, and on occasions of the ordination of bishops or of priests, and other similar acts of his episcopal office. The pallium is a narrow annular band of white woollen web, about 3 inches wide, upon which black crosses are embroidered, which encircle the neck of the archbishop, and from which two narrow bands of the same material depend, one falling over the breast, the other over the back of the wearer. It is made wholly or in part from the

wool of two lambs, which are blessed annually on the festival of St Agnes.

Palm (*Palma* or *Palmaceæ*), a natural order of endogenous plants, the products of which are of extreme importance and utility to man. They are arborescent, with erect stems, usually slender as compared with the extreme height to which some of the species attain, and simple or rarely branching; some are stemless, their leaves springing direct from the ground; others are sarmentose, twining about the stems and branches of neighbouring trees, by means of hooks or prickles, or trailing on the ground with stems of almost incredible length and extreme slenderness, as in the case of many of the Calami. Externally the stems are hard and horny, often coated with a siliceous deposit hard as flint, and finely polished; they frequently are armed with spines, and marked with the scars of dead leaves, or clothed in the upper part with the remains of the dead leaf-stalks enveloped in masses of fibre. The interior of the stem is generally soft and pithy, intermingled with bundles of fibre longitudinally. So soft and easily extracted is the internal substance of the stems of many palms that the outer hard case may readily be formed into a cylindrical tube. The leaves vary much in form superficially, but all the variations belong to two types—the fan-veined and the pinnate-veined. In the former the general outline is that of a fan, with veins arising from the top of the leaf-stalk and radiating like the ribs of a fan. In the other type the leaves are more or less elongated, with a distinct midrib extending to within a little of the extremity of the blade, which is always there cleft in two down to the point of the midrib, and with the veins springing from the sides of the midrib like the pinnules of a feather. Leaves of this type are sometimes entire, but more generally pinnate, and impart much elegance and grace to the figure of the particular species to which they belong. The size of palm-leaves varies extremely, some being only a few inches in length, as in some species of *Malortia*, while in *Mancaria saccifera* they attain the enormous proportions of 35 feet in length by 5 or 6 feet in breadth. The inflorescence is a simple or many-branched spadix enclosed in a spathe of one or several valves. The flowers are small individually, but numerous, usually of a yellow tint, and in some species powerfully odorous. They are unisexual, bisexual, or polygamous, the male and female flowers being borne in some species on different plants. The fruit when ripe is berry-like, drupaceous, plum-like, or, as in the cocoa-nut, nut-like.

Palms are natives chiefly of the tropical regions of the earth. A few are found in extra-tropical countries extending to 36° N. lat. in America, 34° N. lat. in Asia, and in Europe *Chamerops humilis*, which is the only indigenous species, extends to 44° N. lat.; no species are found beyond 38° S. lat. Linnæus, whose knowledge of palms was limited to the more arborescent species, very appropriately named them the 'Princes of the Vegetable Kingdom.' Their stately habit, the elegant proportions of the stems, and the grace and beauty of the leaves of the majority of the larger species, coupled with the great variety and utility of the products of all, mark them as a most distinguished and valuable group of plants, gratifying the eye by their adornment of the landscape, and ministering abundantly to the necessities and the pleasures of both savage and civilised man. Their stems when young and tender are delicious and nutritious food; when old and mature those of certain species yield valuable farinaceous substances; some are valuable as timber-trees, and the terminal bud of several consists of a mass of tender mucilaginous leaves, which are esteemed a delicate

and delicious vegetable. Many yield by incision or otherwise an abundance of sweet sap, from which sugar, refreshing drinks, wines, spirits, and vinegar are obtained. Their leaves are used for thatch, and for the making of mats, baskets, hats, umbrellas, thread, cord, and clothing. They yield excellent and inexhaustible materials, and they are in some cases a natural substitute for writing-paper, the records and writings of many eastern peoples being inscribed upon them.

The order comprises, according to Hooker and Bentham in *Genera Plantarum*, between 130 and 140 genera, and the number of species known is variously estimated by different authorities at from 600 to 1000.

The genus *Chamædorea* is composed of about sixty species, all of slender, graceful habit, their smooth stems often not exceeding an inch in diameter, though they may be twenty or more feet high. They are used in South America for making

Fig. 1.—*Chamædorea aurantiaca*.

bridges, as the bamboo is in China and India. The flowers of several of the species—including those of *C. aurantiaca* (fig. 1)—are highly esteemed as a culinary vegetable in some of the

countries of Central America, but for this purpose they must be extracted from the spathe before it bursts. The fruit of *Leopoldina major*, called by the natives of Brazil *Jard-assu*, is collected by them and burned, and the ash, after being washed, is used as a substitute for salt. It is described, however, as being bitter rather than saline. *Euterpe edulis*—also a native of Brazil—produces fruit in size, shape, and colour like that of the sloe. From the fruit of this species a beverage is made by infusion which is much relished. *E. oleracea* produces an edible and nutritious cabbage. The *Nibong* of the Malays of the Eastern Archipelago is *Oncosperma filamentosa*, the cabbage of which is more highly esteemed than that of any other palm indigenous to that region. From the fruit of *Enocarpus batava* a wholesome beverage called *Patava-yukissé* is made on the Rio Negro. The fruit of *Oreodoxa regia*, an extremely handsome palm, a native of Cuba, is too acrid for human food, but is used there for fattening hogs.

Areca catechu is the Betel-nut Palm (see ARECA). The fruit enters into the masticatory of that name so much used in India. It contains gallic acid, much tannin, a principle analogous to catechu gum, a volatile oil, a red insoluble matter, a fatty substance, and some salts. A spurious kind of catechu is obtained from the nuts in two colours—one dark or black, which is extremely astringent; the other yellowish brown, which is less astringent and more pure. Besides being used as a masticatory and in medicine in cases of dysentery, the substance is employed in tanning leather and in dyeing calico. The terminal shoot of this palm furnishes an excellent cabbage, as also do several other species of *Areca*. But the true Cabbage Palm is *A. oleracea*, a noble species indigenous to the West Indies, attaining the height of 170 to 200 feet, with a diameter of stem of about 7 feet. The leaves are pinnate, about 20 feet long, the pinnules in full-sized leaves being often 3 feet in length. The terminal bud or cabbage is enclosed among many thin snow-

white brittle flakes. It has the flavour of the almond, but with greater sweetness, and is boiled and eaten with meat. As its removal causes the death of the tree, it is regarded as an extravagant delicacy only rarely to be enjoyed, because of the great importance of the other products which the tree yields. The inflorescence is extracted from the spathes before they open, are pickled, and esteemed a delicate relish with meat. The nuts yield a useful oil by decoction. The shell or outer hard crust of the stem is employed in making gutters, and the pith yields a kind of sago if extracted immediately the tree is felled; but if allowed to lie and decay on the ground, it becomes the breeding ground of a peculiar grub, which is greatly esteemed as a delicate article of food in Martinique and St Domingo.

Ceroxylon (Iriartia) andicola, a native of Peru, growing at an elevation of 8000–10,000 feet above sea-level, is a handsome species rising to the height of 160 or more feet. The stem exudes from the annular cicatrices of the fallen leaves a resinous substance called by the inhabitants *cera de palma*. It is composed of about two parts of a yellow resin and one part of wax, the texture of which is more brittle than beeswax. A sub-resinous matter is also extracted from it named *ceroxylon*, which assumes the form of silky crystals, is soluble in alcohol, and phosphorescent by friction. The exudation, mixed with certain proportions of wax or tallow, is employed in candle-making. Besides the resinous exudation the trunk yields a valuable and durable timber, the leaves are excellent and durable material for thatch, and they supply a strong, useful fibre for the manufacture of ropes and cordage. The Kiziuba Palm (*C. ezorrhiza*) is a native of Central and South America, and is a singular and

Fig. 2.—*Arenga saccharifera*.

interesting tree on account of its peculiar habit of growth. The roots all spring from the stem above ground, every new root emerging from a point somewhat higher on the stem than the one which preceded it. And as the old roots decay as the new are produced and penetrate the ground, a tree of some age presents the curious spectacle of being supported on three or four legs long enough and wide enough apart to enable a man to pass between them erect. The timber is used in flooring and for making umbrella-sticks, musical instruments, &c. Blowpipes (q.v.) for poisoned arrows are made from the stems of *C. setigera*.

The Sugar Palm (*Arenga saccharifera*, see fig. 2) is a native of the Moluccas, Cochinchina, and the Indian Archipelago, and is of immense value to the

natives of these countries on account of its various products. It yields an abundant sweet sap, from which a chocolate-coloured sugar named *jaggery* is made. The sap fermented makes an intoxicating drink variously named by the inhabitants of the different countries *neroo* or *brum*. From the pith of the stem sago is obtained in great quantity, a single stem yielding as much as from 150 to 200 lb. The leaves supply *Gomuto fibre*, which is celebrated for its great strength and durability when formed into cordage and ropes, and at the base of the leaves a fine woolly material, named *baru*, is developed in mature trees, which is employed in caulking ships, stuffing cushions, and making tinder.

Caryota urens (see fig. 3), one of the noblest palms of India, yields some remarkable products. The flesh of the fruit, which resembles a plum in size and structure, is very acrid, and corrodes and burns the lips and mouth. From the terminal bud a sweet watery liquor is obtained, which, when boiled, yields *jaggery*. The terminal bud is also

Fig. 3.—*Caryota urens*.

eaten as a cabbage. From the pith of the stem sago is obtained, which is made into bread, and prepared in various other ways, and is a valuable article of food to the natives. The tree is named *Evim-pannah* in Malabar and *Kittul* in Singhalese, and the fibre called *Kittul* is obtained from its leaves.

The genus *Calamus* and its immediate allies are regarded as forming a connecting link between the palms and the grasses, having the inflorescence and fruit of the former and in some cases the habit of the latter. Certain species—viz. *C. Roxburghii*, *C. Royleanus*, both of which are included in *C. rotang* by some authors, and *C. viminalis* and others—furnish the rattan-canes employed in making ropes and cables, chair bottoms, couches, baskets, mats, &c. The walking-sticks known as Malacca canes are made from the stems of *C. scipionum*, a species which grows not in Malacca, but in Sumatra, and the canes are chiefly exported from Siak in that island. The stems of the Great Rattan (*C. rudentium*) and others are of prodigious length, extending to hundreds of feet, clinging by hooks attached to their leaves to the trunks and boughs of neighbouring trees, or trailing on the ground. They are extremely hard externally, and usually smooth, with a dense siliceous crust on the surface. *C. draco* furnishes the finest quality of the resinous substance known as *Dragon's Blood* (q.v.), although a similar substance is obtained from various other plants. In this case it is exuded from the surface of the fruit, and is separated from it by rubbing or shaking the fruit together in a bag. An inferior quality of the same substance is also obtained from the tree by incision

of the stem, and by steaming the fruit after the natural exudation has been collected. The species are very numerous, about 200 having been described, but few are more singular than *C. adspersus* (see fig. 4), which resembles a creeping or twining grass rather than a palm, the stems rarely exceeding in thickness stout wheat straw.—*Zalacca edulis* is regularly cultivated by the Burmese for the sake of its pleasantly acidulous fruit, which grows to the size of a walnut.

The succulent scaly pulp which encloses the seed is the edible part. — *Raphia vinifera*, a native of Guinea, yields a rather abundant sap, from which a strongly spirituous wine is obtained. One of the most beautiful and singular of palms is *R. taedigera*, an inhabitant of the banks of the Amazon. The trunk of the tree is short, from 6 to 10 feet high, but from the summit the leaves rise al-

Fig. 4.—*Calamus adspersus*.

most perpendicularly to the height of 40 feet or more, arching gracefully outward towards the apex. The footstalk of these enormous leaves alone are often 12 or 15 feet long by 4 or 5 inches in diameter. The integument of these footstalks is thin, extremely hard and elastic, and light as a quill, and, being easily split into straight strips, is made into window-blinds, baskets, &c. by the Indians.

The true *sago* of commerce (see SAGO) is derived from various species of the genus *Sagus*, although other species of palms, as has already been stated, and also plants widely different botanically, such as *Cycas revoluta*, also yield a kind of sago. *S. Rumphii*, *S. laevis*, and *S. farinifera* are the species from which the largest quantity of true sago is obtained. *S. Rumphii* is a native of the Indian Archipelago, Malacca, Borneo, Sumatra, Celebes, and the Moluccas being the principal places in which it is cultivated. The tree is small, rarely exceeding 30 feet in height of stem, which consists of a hard shell about 2 inches thick enclosing a mass of spongy pith—the sago. This pith is gradually absorbed after the tree reaches maturity, leaving the stem quite hollow. The proper time to fell the trees, before the pith begins to diminish in bulk or quality by absorption, is indicated by the upper leaves becoming covered with a sort of farina or white dust. When felled the stem is cut into lengths of 6 or 7 feet, which are split, the better to remove the pith. There are various modes of extracting the fecula from the insoluble substances with which it is combined in the stem, but washing and straining are the principal features of every process. A single tree, it is said, will yield from 500 to 600 lb. of sago.—The Bache (*Mauritia flexuosa*), a native of Guiana, supplies the chief wants of the people wherever it grows; the stems furnish timber for building their dwellings, the leaves thatch for the same, and material for mats, couches, hammocks, &c.; the pith yields sago; the juice by fermentation gives an excellent beverage; the kernels of the

fruit are ground into meal and made into bread; and the fibre is converted into cordage and clothing.—The Palmyra Palm (*Borassus flabelliformis*) is one of the most common of its tribe in India. In some parts of the country it grows spontaneously, and it is found as far north as 30°; in others it is the subject of careful cultivation. It furnishes the greater part of the palm-wine of India, which by the natives and Famula is called *Callu* and *Noongpoo*, and by Europeans *Toddy*. The fruit is about the size of a child's head, somewhat triangular, and within a thick, fibrous rind contains three seeds about the size of a goose's egg. The seeds when young are eaten by the natives, being jelly-like and palatable. The toddy is obtained by wounding the spathe before the inflorescence expands. After a few days a clear, sweet liquor exudes from the wound, and is carefully collected in pots suspended under the wounded spathe. A tree yields about three quarts daily. The liquor is drunk fresh, and will only keep sweet for about three days, when it undergoes fermentation and becomes sour, and is distilled into *arrack*. *Jaggery* is also made from the juice. The young plants when a few inches high are cooked and eaten as a vegetable. The leaves, which are fan-shaped and large, are turned to the various uses alluded to in connection with species already described, and in India they are almost universally used for writing upon with an iron stylus.

The Double Cocoa-nut, or Sea Cocoa-nut as it has been called, is *Lodoicea seychellarum*. The nuts of this tree are seen occasionally in museums and in the cabinets of collectors of curios, often beautifully polished and carved by native workmen, and formed into caskets and other ornaments. For long their origin was shrouded in mystery. They were frequently found floating about in the ocean before the discovery of the tree, and an absurd belief was entertained by Malay and Chinese sailors that they were the fruit of some marine tree. The tree, a native of the Seychelle Islands, is very elegant, attaining a height of from 50 to 80 feet, with leaves 20 feet long supported on stalks of equal length. The fruit is one of the largest produced by any of the palms, being a foot or a foot and half in length. The kernel near the base is divided into two parts—hence the name Double Cocoa-nut—and while young part of the fleshy substance in which it is enclosed is edible. The chief products of the tree are timber and fibre for cordage, and a downy kind of fibre which envelops the young leaves is used for filling mattresses and pillows.

The Talipot Palm of Ceylon (*Corypha umbraculifera*) is notable only for the variety of uses to which its leaves are put in Ceylon and other parts of India to which it is indigenous. The leaves are of immense size, and, being palmate with the leaf-stalk attached near the middle, they are readily formed into umbrellas and tents; the cane-like ribs being removed and the blades neatly stitched together, they may be folded up with great facility. They are also very much used for the books or *colahs* of the inhabitants. Many of these alleged to be made of Egyptian papyrus are formed of the leaves of this palm. The tree grows to the height of 100 feet, and has a very grand and imposing appearance.—A closely allied species (*C. taliera*) is the Talipot Palm of the Indian peninsula. It grows to about the same height as the preceding species, with leaves of a more durable kind for the purposes of thatch, but not so adaptable to more delicate and artistic uses.—*Licuala peltata* is the Chittah-pat of Assam, the leaves of which are extensively used for making umbrellas, punkahs, and hats. The stems of *L. acutifolia* are made into walking-sticks, named by Europeans *Penang Lawyers*.—*Copernicia cerifera*, a native of northern

Brazil, produces an edible fruit; and from the leaves, after they have been removed from the trees and dried, is obtained an inferior kind of vegetable wax, which is used in candle-making and to adulterate beeswax.

Of the American Palmetto Palm, a native of the Carolinas and Florida, the most important species is the Cabbage Palmetto (*Sabal palmetto*), which sometimes grows to 50 feet in height and 15 inches in diameter, with leaves 5 feet long and broad. It is found also in the Bermudas. Its products are timber and the leaves, the former being exceedingly durable, very porous (see MOULTRIE), and especially valuable for wharf-building, as it resists water and is not attacked by the teredo. The fruit is not edible.—The Palmetto of Europe is *Chamaerops humilis*, which inhabits the countries on both shores of the Mediterranean, occupying great tracts. It rarely reaches 10 feet in height, and usually is much less, its growth being exceedingly slow. The leaves are fan-shaped and abound in excellent fibre, with which the Arabs, combining it with camels' hair, make tent-covers; in Spain it is made into ropes and sailcloth, and in France into carpets, named *African haircloth*. The French in Algeria make paper and pasteboard of it, and so well adapted is it to this purpose that its use might be more extended in other countries. The fruit is edible, and is eaten by the Arabs and the inhabitants of Sicily and Southern Italy. The plant endures the climate of London, but scarcely grows. *C. Ritchiana*, a native of Sind and Afghanistan, and *C. excelsa*, a native of China and Japan, both produce excellent fibre. The leaves of *Thrinax argentea* supply the material called *chip*, of which ladies' hats and bonnets of that name are made. The trunks of *T. parviflora*, a native of Jamaica, though of slender diameter, are said to be very suitable for

Fig. 5.—*Sabal (Trithrinax) mauritiformis*.

piles and marine buildings subject to immersion, as they are impervious to the influence of water, and are not attacked by borers or worms. *Sabal (Trithrinax) mauritiformis*, a native of New Granada (fig. 5), is a low-growing but very handsome palm, not remarkable for any products of special utility.

The *Piritu* of Venezuela, the *Paripou* of Guiana, and the *Papúmba* of the Amazon are the local names of one species of palm—*Gulielma speciosa*. It produces fruits somewhat triangular in shape, about the size of an apricot, and bright reddish yellow in colour. They have a peculiar oily flavour, and are eaten boiled or roasted, when they resemble chestnuts. They are also ground into meal, which

is baked in cakes.—The Great Macaw tree of the West Indies (*Acrocomia sclerocarpa*) is a native of Jamaica, Trinidad, and the adjacent islands and continent. In Brazil it is called *Macahuba*, and in Guiana *Macoya*. The tree grows from 20 to 30 feet high, with a crown of leaves, each of which measures from 10 to 15 feet in length. The fruit yields an oil of yellow colour, sweetish taste, and having the odour of violets, which is employed by the natives as an emollient for painful affections of the joints; and in Europe it is used in the manufacture of toilet soaps. The nuts are capable of receiving a high polish, and are converted by the natives and the negroes into ornaments.—The Tucum Palm (*Astrocaryum tucuma*), a native of the Rio Negro and the Upper Amazon, yields a very superior fibre, the cordage from which is knitted into hammocks, which are in great demand with the Brazilians. The fleshy outer covering of the fruit is eaten by the natives.—The Murumuru Palm (*A. murumuru*) produces a very agreeable fruit with the fragrance of musk. Cattle eat the fruit with avidity, but evacuate the hard stony seeds undigested. In times of scarcity these seeds are carefully collected and used to feed pigs, which are very fond of them, and find no difficulty with their powerful teeth and jaws in masticating them.—*Attalea funifera* furnishes the whalebone-like fibre now so much used in Britain for making brooms and brushes. The tree attains the height of 20 or 30 feet. At the base of the leaves, which are used for thatching, the fibre known in commerce as *Piassava fibre*, *Para Grass*, and *Monkey Grass* is produced. It is employed in the countries in which it grows to make coarse but strong and durable cables, but is unfit for any finer purpose. The fruit is the well-known *Coquilla nut*, much used in turnery for the making of knobs to walking-sticks and umbrellas, handles to bell-pulls, &c. The nuts are extremely hard and susceptible of a fine polish, and exhibit a beautifully mottled surface of light and dark brown.—The fruit of *A. cohune* yields from its kernel a valuable oil called *Cohune Oil*, which is said to be superior in quality and to burn twice as long as the best cocoa-nut oil. It is a native of Honduras and the Isthmus of Panama. The trunk, which attains the height of about 40 feet and is crowned with leaves some 30 feet long, yields by tapping a kind of palm-wine.—The *Palm-oil* of Africa is the product of the fruit of *Elæis guineensis*. The tree is cultivated now in the West Indies and tropical South America for the sake of the oil. It attains a height of 60 to 80 feet, with a spreading crown of pinnate leaves, each about 15 feet long, the footstalks of which are armed with stout hooked spines. The flowers have a strong peculiar smell, like anise and chervil in combination. The fruit forms a large head, consisting of a great number of bright orange-coloured drupes; when ripe each drupe has an oily pulp with a stone or kernel in the centre, and it is from this pulp that the oil is obtained. To extract the oil the pulp is first bruised to a paste in wooden mortars, and is then boiled in water. The oil which rises to the surface of the water is reddish or orange in colour, and has an agreeable odour of violets; it is allowed to cool, and is then skimmed off. In warm countries it retains its oily consistence, but in cooler climates it acquires the solidity of butter. It is used by the natives universally as butter is in Europe. The quantity of palm-oil now imported to Great Britain is enormous. It is employed in the manufacture of candles, toilet and common soaps, and as a lubricant of railway-carriage wheels, &c. It is composed of about thirty-one parts of stearin and sixty-nine of olein. The tree yields from its trunk abundance of palm-

wine.—The *Coquito* of Chili is *Jubæa spectabilis*, a tree of about 50 feet in height, with a spreading crown of leaves. From its trunk a syrup is extracted, called *miel de palma*, which is much esteemed by the Chilians and Europeans in cookery in various ways. It is obtained by cutting down the tree and lopping off its crown of leaves, when the sap flows from the wound, and is carefully collected. By cutting off a fresh slice from the wound daily, or when the flow of sap becomes weak, it may be kept flowing for several months; a good tree is said to yield as much as ninety gallons of sap, which on being boiled down assumes the consistence of treacle.

Much information on palms and their products will be found in the *Historia Palmarum*, by Martius; in the *Flora Brasiliensis*, by Drude; and *A Popular History of Palms*, by Seeman. See ARECA, COCOA-NUT, CHAMEROPS, DATE PALM, DOOM PALM, FIBROUS SUBSTANCES, &c.

Palm, a measure of length, originally taken from the width of the hand, measured across the joints of the four fingers. In Britain a palm is, somewhat loosely, understood to be the fourth part of an English foot, or 3 inches.

Palm, JOHANN PHILIPP, a bookseller of Nuremberg, who has acquired historic celebrity as a victim of Napoleonic tyranny in Germany, was born at Schorndorf in 1768. In the spring of 1806 a pamphlet entitled *Deutschland in seiner tiefsten Erniedrigung* (Germany in its Deepest Humiliation), which contained some bitter truths concerning Napoleon and the conduct of the French troops in Bavaria, was sent by his firm to a bookseller in Augsburg in the ordinary course of trade. The book fell into the hands of Napoleon's officers; they made the emperor acquainted with it. He ordered Palm, as the publisher, to be arrested, tried him by court-martial, and shot him at Braunau, 26th August 1806. This murder greatly incensed the German people against the French.

Palma, (1) the capital of the island of Majorca (q.v.) and of the Balearic Islands, stands on the Bay of Palma, on the south coast. The cathedral, a Gothic edifice (1232-1601), contains the tomb of King Jayme II. of Aragon and a valuable collection of church ornaments. The tomb of Raymond Lully (q.v.) is in the church of St Francis. There are, further, a beautiful exchange (1426-46), an old Moorish palace, and a 16th-century town-hall, with pictures. Palma is one of the most aristocratic cities in Europe. Pop. (1887) 60,514. They weave silks and woollens, make jewellery, and various articles of common use. The port is protected by a mole, and the town by a wall and batteries. The commerce reaches a total value of about £1,600,000 per annum.—(2) A town of Sicily, 14 miles SE. of Girgenti. Pop. 11,702.—(3) The name of one of the larger of the Canary Islands (q.v.).

Palma, JACOPO, commonly called PALMA VECCHIO (i.e. Old Palma), painter of the Venetian school, was born about 1480 at Serinalta, near Bergamo, and died at Venice just about the middle of the year 1528. At first working under the influence of the Bellinis, he subsequently painted in the spirit and style of Giorgione and Titian, and may be placed at the head of the second class of great Venetian artists. His pictures are either sacred subjects or portrait groups. Of the former the best are a series of six figures of saints, St Barbara and others, in the church of St Maria Formosa at Venice. The best portrait group is three sisters, generally called the 'Three Graces.'—His brother's grandson, likewise called JACOPO (1544-1628), and nicknamed IL GIOVANE (the Younger), painted religious pictures of greatly

inferior merit, though he modelled his style on that of Titian, Palma Vecchio, and Tintoretto. Except for eight years in Rome, he spent all his life at Venice.

Palma Christi. See CASTOR-OIL PLANT.

Palmblad, VILHELM FREDRIK, a Swedish historian, was born 16th December 1788, at Liljested, in East Gothland, where his father held a post under the government, studied at Upsala, and became professor of Greek in the same university in 1835. He died 2d September 1852. Amongst his works (which deal with geography, history, and classical philology) are the *Biografisk Lexikon* (23 vols. 1835-59) and the historical novel *Aurora Koningsmark* (1847).

Palmellaceæ. See ALGÆ.

Palmer (Lat. *palmifer*, 'a palm-bearer'), properly so called, was a pilgrim who had performed the pilgrimage to the Holy Sepulchre, and had returned, or was returning home after the fulfilment of his vow. The Palmers were so called from their carrying branches of the oriental palm, in token of their accomplished expedition. On arriving at their home they repaired to the church to return thanks to God, and offered the palm to the priest, to be placed upon the altar.

Palmer, EDWARD HENRY, the 'Sheikh Abdullah,' was born 7th August 1840, at Cambridge, and while a schoolboy there picked up Romany (the Gypsies' tongue), while a clerk in the City Italian and French. In 1859 he all but died of consumption; in 1860 at Cambridge began to devote himself to oriental studies—Arabic, Persian, and Hindústani; in 1863 obtained a sizarship at St John's; and in 1867, graduating with a third-class in classics, was yet elected a Fellow of his college. During 1868-70 he was engaged for the Palestine Exploration Fund in the survey of Sinai, and, with Charles Tyrwhitt Drake, of the Desert of the Wanderings, acquiring meanwhile a marvellous knowledge of the wild Arab tribes. In 1871 he was appointed Lord Almoner's professor of Arabic at Cambridge (his stipend £40, 10s., augmented next year by £250); and in 1874 he was also called to the bar. So ten years went by of work and play—he was a wonderful conjurer—of sorrow, too, and trouble, for he lost his first wife and got involved in money difficulties, till in 1881 he turned London journalist, writing principally for the *Standard*. Finally, in June 1882, on the eve of Arabi's Egyptian rebellion, he was pitched on by government for the perilous mission of winning over the Sinai tribes to Britain and hindering the destruction of the Suez Canal. He made two expeditions—the first his great ride from Gaza to Suez (July 15-31), and the second when, starting from Suez with Captain Gill, R.E., and Lieutenant Charrington, R.N., he and they on August 11 were betrayed and murdered in the ravine of Wady Sudr. Eight months later the three were buried in St Paul's.

Of a score of works by Professor Palmer may be mentioned his *Desert of the Exodus* (1871), *Arabic Grammar* (1874), *Song of the Reed* (1876), *Poems of Behâ ed Din Zoheir* (1876-77), *Persian-English and English-Persian Dictionary* (1876-83), *Haroun Alraschid* (1880), and a translation of the *Koran* (1880). See his *Life* by W. Besant (1883).

Palmer, ROUNDELL. See SELBORNE (LORD).

Palmer, SAMUEL. See ENGRAVING, Vol. IV. p. 380.

Palmerston, HENRY JOHN TEMPLE, VISCOUNT, was born at the family mansion, Broadlands, near Romsey, Hants, 20th October 1784, and belonged to the Irish branch of the ancient English family of Temple, taking name from Temple in Leicestershire. Sir W. Temple, the diplomatist and patron of Swift, was a member of this family,

which removed to Ireland about 1601, and which was ennobled in 1722, when Henry Temple was created a peer of Ireland with the dignities of Baron Temple and Viscount Palmerston. His grandson, Henry, second Viscount (1739-1802), was father of the great minister, and superintended his education at Broadlands, until he sent him to Harrow. Young Temple in 1800 went to the university of Edinburgh, where he attended the lectures of Dugald Stewart and other professors. In 1802 he succeeded his father as third Viscount, and in 1803 he matriculated at St John's College, Cambridge. His eminent abilities were early recognised, for he was scarcely of age when the Tory party in the university selected him (1806) as their candidate to succeed Mr Pitt in the representation. Unsuccessful at Cambridge then and again in 1807, he entered parliament in the latter year for Newport, in the Isle of Wight, his colleague being Arthur Wellesley, then Chief-secretary for Ireland. In 1811 he exchanged Newport for the university of Cambridge, enjoyed the distinction of representing his *alma mater* for twenty years, and only lost his seat when he became a member of the Grey administration and supported the Reform Bill. For the last two years of the unreformed parliament he sat for the now extinct borough of Bletchingly. At the first election after the Reform Act he was returned for South Hampshire, but lost his seat at the general election of 1835. He immediately afterwards found a seat for the borough of Tiverton.

Having traced his representative, we now turn to his official career. Palmerston entered life as a member of the Tory party, and accepted the office of Junior Lord of the Admiralty and Secretary at War (without a seat in the cabinet) in 1809. This office he held during the successive governments of Mr Perceval, the Earl of Liverpool, Mr Canning, Lord Goderich, and the Duke of Wellington—a period extending from 1809 to 1828. There was ample scope at the War Office for Palmerston's administrative talents and activity. The military system swarmed with abuses, and the labour thrown upon the Secretary at War during the Peninsular campaigns was prodigious. In 1816 an attempt was made to assassinate Palmerston by an insane army-lieutenant, named Davis, who fired a pistol at him as he was entering the Horse Guards; the bullet, however, only inflicted a slight wound. Palmerston early attached himself to the Canning section of the Liverpool administration, and he accepted a seat in the cabinet of Mr Canning. His official connection with the Tory party ceased in 1828, when the 'Great Duke' insisted on accepting Mr Huskisson's resignation, which was followed by Palmerston's retirement. The Duke's government was swept away in the reform flood of 1830; and Earl Grey, who became prime-minister, offered the seals of the Foreign Office to Palmerston. The European horizon was so disturbed at this crisis that a great political authority declared that if an angel from heaven were in the Foreign Office he could not preserve peace for three months. Palmerston falsified the prediction. Louis-Philippe then filled the throne of France; and for the first time on record England and France acted in concert, and without jealousy, under Palmerston's foreign ministry. He took a leading part in securing the independence of Belgium, in establishing the thrones of Queen Isabella of Spain and Queen Maria of Portugal on a constitutional basis, in endeavouring, in alliance with Austria and Turkey, to check Russian influence in the East, and in the war with Mehemet Ali. In 1841 Palmerston went out of office with the Whigs on the question of free trade in corn; but on their return in 1846

he resumed the seals of the Foreign Office. His second foreign administration furnished various subjects of hostile party criticism, among which may be mentioned the civil war in Switzerland, the Spanish marriages (see GUIZOT), the European revolutions in 1848, the rupture of diplomatic relations between Spain and Great Britain, and finally, the affair of Don Pacifico (a Gibraltar Jew living in Athens, who claimed the privileges of a British subject), and the consequent quarrel with Greece. His strenuous self-asserting character, his brusque speech, his frequently hasty interferences in foreign affairs, were little calculated to conciliate opponents at home, and secured him many enemies abroad—the name 'Firebrand Palmerston' still clinging to him on the Continent. A vote of censure on the foreign policy of the government was in 1850 carried in the House of Lords on the motion of Lord Stanley (afterwards Earl of Derby). A counter-resolution, approving the foreign policy of the government, was thereupon moved by Mr Roebuck in the Lower House. The debate lasted four nights. In a speech of five hours' duration—'that speech,' said Sir Robert Peel, 'which made us all so proud of him'—Palmerston entered upon a manly and dignified vindication of his foreign policy; and Mr Roebuck's motion was carried by a majority of forty-six.

In December 1851 the public were startled at the news that Palmerston was no longer a member of the Russell cabinet. He had expressed to the French ambassador in London his approbation of the *coup d'état* of Louis Napoleon, without consulting either the premier or the Queen; and, as explanations were refused, Lord John Russell advised his resignation. Palmerston, in the general opinion, was 'smashed'; but he soon got his 'tit for tat'; for in the following February, soon after the meeting of parliament, he avenged himself by shattering the Russell administration to pieces on a comparatively trifling question—a Militia Bill. He refused an offer from the Earl of Derby to join the government which he was commissioned to form, but accepted the post of Home Secretary in the coalition administration of the Earl of Aberdeen in 1852. The fall of this coalition government in the winter of 1854-55, on Mr Roebuck's motion for a Sebastopol committee, placed Palmerston in his seventy-first year in the position of prime-minister, to which he was unanimously called by the voice of the nation; in his own phrase he was 'the inevitable.' He vigorously prosecuted the Russian war until Sebastopol was taken, and peace was made. His government was defeated in March 1857 on Mr Cobden's motion condemnatory of the Chinese war. Palmerston appealed to the country, and met the House of Commons with a largely increased majority. But his administration fell in February 1858, over the Conspiracy Bill, intended to protect the French emperor against the machinations of plotting refugees. A short Conservative administration followed; but in June 1859 Palmerston was again called to the post of First Lord of the Treasury, which he continued to fill up to his death, the chief events of this premiership being the American civil war (with its *Trent* and *Alabama* incidents), Napoleon's war with Austria, and the Austro-Prussian war with Denmark. His last great speech was his defence of the policy of his government, delivered in July 1864, in reply to the attack of Mr Disraeli. He died at his country seat, Brockett Hall, 18th October 1865, and was buried in Westminster Abbey. Both his titles became extinct with him.

It was his ambition to be considered the minister of a nation rather than the minister of a political party; and his opponents have been constrained to

admit that he held office with more general acceptance than any English minister since the time of the great Lord Chatham. As an orator he was usually homely and unpretending, but always sensible and practical. He was a dexterous tactician, of irrepressible spirit, and a ready, witty, and often brilliant debater. He was popular as a minister, because he was thoroughly English in his ends and aims. Even his robust health, off-hand manner, manly and usual jaunty bearing, and physical vigour were elements of his popularity, because they were regarded as a glorification of the English sports, which he was never ashamed to patronise. He desired nothing so ardently as to promote the prosperity, influence, and grandeur of Great Britain, and his national character and national spirit were thoroughly appreciated by his countrymen.

See *Life of Palmerston*, by Lord Dalling (3 vols. 1870), continued by Evelyn Ashley (2 vols. 1879); and smaller works by Anthony Trollope (1882), Lloyd Sanders (1888), and the Marquis of Lorne (1891).

Palmerston. See PORT DARWIN.

Palmer-worm, a name given to many large kinds of grub, the larvæ of coleopterous insects, destructive to various vegetable substances.

Palmetto-leaves, the leaves of the Palmyra palm (see PALM, p. 723), imported into Europe for the manufacture of hats and mats. For the palm known as Palmetto, see PALM, p. 720.

Palmeri, LUIGI, meteorologist, born 22d April 1807, taught mathematics in several lyceums, became in 1847 professor at Naples, and in 1854 director of the observatory on Vesuvius. He has invented many meteorological instruments, and written several works on volcanoes and seismology.

Palmipedes, also called NATATOIRES, or SWIMMERS, the web-footed birds, in some classifications an order of Birds (q.v.).

Palmistry, or CHIROMANCY (Gr. *cheir*, 'the hand, and *mantikē*, 'divination'), is the art of 'reading the palm'—the art which professes to discover the temperament and character of any one, as well as the past and future events of his life, from an examination of the *palm* of his hand, and of the lines traced upon it. As a considerable body of very complicated rules and directions have been laid down by authorities, ancient and modern, to enable the student to read the palm, palmistry claims to be regarded as a 'science,' or at least as a branch of an interpretative science of the hand in general, to which the name *Chiroscopy* has been given. The other branch of this general science has been called *Chirognomy*, and is concerned with the interpretation of the form and character of the hand and fingers, while Chiromancy treats of the palm only (see DIVINATION).

As an art palmistry appears to be of great antiquity. Mr Nesfield, in his Report on the caste system in the North-west Provinces and Oudh (1885), tells us that there is a caste of Brahmans, called Joshi, who profess the art of fortune-telling by means of marks on the palms of the hands, the face, and the body generally; and who seem to have practised it from remote times. Palmistry has an ancient literature of its own in India; the ancient Samudriki appears to have had some acquaintance with letters, but the Joshi, his modern representative, is quite illiterate, though he generally carries about with him a manual of palmistry, of whose contents he knows nothing. There are also a number of wandering outcasts in India who tell fortunes by palmistry.

That palmistry was to some extent at least known to the ancient Greeks we have evidence in the writings of the Stagirite himself. In his

Hist. Animalium Aristotle observes (i. 15) that long-lived persons have one or two lines which extend through the whole hand; short-lived persons have two lines not extending through the whole hand. Other references to this subject occur in the doubtful works, the *Problemata* and the *Physiognomika*, attributed to him. Pliny, too, in his *Natural History* (xi. 114) directly asserts that Aristotle regarded numerous broken lines in the palm of the hand as a prognostic of short life.

Of the cultivation of palmistry among the Romans there is little evidence; but Juvenal, in showing up the curiosity of women and their love of prying into forbidden mysteries, describes the woman of fashion as consulting eagerly Chaldean astrologers and other diviners, while the middle-class woman 'frontemque manumque præbebit vati' (*Sat.* vi. 581). In the 2d century Artemidorus of Ephesus, the author of a work on the interpretation of dreams, is said to have devoted a whole treatise to the subject, which, however, is not extant.

In writers of the middle ages there is much reference to the subject, and the names of Paracelsus, Albertus Magnus, and Cardanus have been associated with it. But the most important work on chiromancy belonging to this period seems to be *Die Kunst Chiromantia*, of Johann Hartlieb, which was printed at Augsburg in 1475. In the 16th century we find several treatises on the subject, of which the most important seem to be those of Johann. Indagine, and of Barthelemy Cocles 'de Bouloigne,' doctor of natural philosophy and of medicine. The former has been Englished by Fabian Wither (London, 1651). In the end of the 18th century palmistry found an important exponent in the celebrated Marie Anne Lenormand (1772-1843), who in her *Souvenirs Prophétiques d'une Sibylle* (1814) foretold the downfall of Napoleon. The chief authorities on palmistry in recent times are two Frenchmen—M. le Capitaine D'Arpentigny, and M. Adrien Desbarrolles; and it is on their works that modern English books on the subject are chiefly founded. D'Arpentigny has expounded principally chiromnomy, or that branch of the interpretative science of the hand which treats of the general form of the hand and fingers. The observation of the fingers and joints of the hand is quite as important to the chiromant as that of the palm itself; but we must refer for D'Arpentigny's system to the works cited below. The thumb is generally regarded as chiromnologically the most important part of the hand. The first, or upper phalange of the thumb, when well developed, shows the presence of will and decision of character; the second, according to its development, indicates more or less logical power (see A and B in diagram). What has to be considered by the chiromant proper is the 'mounts' of the hand, with the marks on them, and the lines in the palm. The 'mounts' are the elevations at the base of the fingers and thumb and in the 'percussion' of the hand—i.e. the side of the palm which extends from the root of the little finger to the wrist: it is so called because it is used in striking. They are seven in number, and are named from the planets, by the signs of which they are also known—viz. ♀ for Venus, ♃ for Jupiter, ♄ for Saturn, ☉ for Apollo, ☿ for Mercury, ♀ for Mars, ☾ for the Moon (see diagram). When well developed the mounts indicate the possession of the quality associated with the respective planets—e.g. Jupiter developed denotes pride and ambition; Saturn, fatality; Apollo, art or riches; Mercury, science or wit; Mars, courage or cruelty; Venus, love and melody; the Moon, folly or imagination. But the effect of a greatly developed mount may be modified by the lines in the palm or by other signs.

There are four principal lines—viz. the line of life, which surrounds the thumb, and which, if long,

indicates a long life; the line of head, the line of heart, and the rascette or the braceleta. These last (the braceleta), if well marked, strengthen the effect of the line of life, each bracelet indicating thirty years of life. The line of heart (the *linea mensalis* of ancient chiromancy), if long, clear cut, and well coloured, denotes an affectionate and devoted character; and the nearer the line stretches to Jupiter the better the character. If the line end in a fork, so much the better. In actors and mimics this line ascends the mount of Mercury.

A, will; B, logic; C, mount of Venus; D, mount of Jupiter; E, mount of Saturn; F, mount of Apollo; G, mount of Mercury; H, mount of Mars; I, mount of the Moon; K, the rascette; a, a, line of life; b, b, line of head; c, c, line of heart; d, d, line of Saturn or fate; e, e, line of liver or health; f, f, line of Apollo or fortune; g, g, the girdle of Venus; R, the quadrangle; m, m, m, braceleta of life.

A good line of head—i.e. a clear-cut, long, unbroken line—indicates the presence of superior intellectual qualities. If the line stretch to the mount of the Moon, it indicates imagination. A winding head-line shows folly and indecision of character; a linked line (like a chain) denotes want of concentration. The other lines (which are not present in all hands) are the line of Saturn or fate (*d, d*), the line of Apollo (*f, f*), the line of liver or health (*e, e*), and the line of Venus (*g, g*). A long, clear-cut line of Saturn (see diagram) foretells a happy and prosperous life, breaks or windings in the line foretell misfortunes or obstacles; a good line of Apollo shows that its owner will be successful in art; a good liver-line promises a long and healthy life; while the Venus line (*Cingulum Veneris*), when present, indicates a character very liable to be influenced by the passion of love. Marks on the mounts or lines, such as stars, crosses, &c., have their respective significations. A good open space between the lines of head and heart (the quadrangle) indicates a generous and noble disposition, while a very narrow space in the quadrangle is a sign of avarice and egotism.

The best handbooks are S. D'Arpentigny, *La Chiromnomy* (Paris, 1843); A. Desbarrolles, *Les Mystères de la Main* (1859), and his *Révélation Complète* (1874); Beamish, *The Psychonomy of the Hand* (1865); A. R. Craig, *The Book of the Hand* (1867); H. Frith and E. Heron Allen, *Chiromancy, or the Science of Palmistry* (1883); Heron

Allen, *Manual of Cheirosophy* (1885); L. Cotton, *Palmitry and its Practical Uses* (1890).

Palmitin. See FATS.

Palm-oil. See PALM, and OILS.

Palm Sunday (Lat. *Dominica Palmarum*, or *Dom. in or ad Palmas*), the Sunday before Easter, is so called from the custom of blessing branches of the palm-tree, or of other trees substituted in those countries in which palm cannot be procured, and of carrying the blessed branches in procession, in commemoration of the triumphal entry of our Lord into Jerusalem. The date of the origin of this custom is uncertain; the procession cannot be traced back beyond the 8th century, though the name Palm Sunday is found two or three centuries earlier. The Greeks appear to have adopted the festival long before the Latins; their procession is at matins. In the Roman Catholic Church the celebrant blesses the branches before the mass, and they are then distributed to the people; the clergy in procession pass out of the church, the doors are closed, and the ancient hymn known in English as 'All glory, laud, and honour' is sung by the choir within and those without, until, on the sub-deacon's knocking at the door, it is again thrown open, and the procession re-enters. During the singing of the Passion in the solemn mass which ensues, the congregation hold the palm-branch in their hands, and at the conclusion of the service it is carried home to their respective houses, where it is preserved during the year. Afterwards it is burned, and the ashes employed, as a rule, for Ash-Wednesday. At Rome the pope himself distributes the palm branches to all the churches of the city. In Moscow until 1700, and in parts of Germany until the beginning of the 19th century, a wooden image of an ass was led about the streets, followed by the people bearing the consecrated branches.

Palm-tree. See PALM.

Palmyra, in ancient times, from about 100 A.D. to the 14th century, more especially in the 2d and 3d centuries, a wealthy and magnificent

Arabic settlement, planted at a spot that formed a convenient station on the great caravan route between the Persian Gulf and the Mediterranean. At all events, after the decline of Petra (q.v.; also NABATEANS) in 105 A.D., Palmyra took its place as the chief commercial centre in northern Arabia. Its merchant aristocracy reaped great advantage from the long-protracted wars between Rome and Parthia by acknowledging the supremacy of Rome. From both Hadrian and Septimius Severus it received special favours and privileges. One of its chiefs, Odænathus, husband of the more famous Zenobia (q.v.), extended his power over most of the adjoining countries, from Egypt to Asia Minor. Aurelian at length crushed in 272 the attempt of the Palmyrenes to found an independent empire. After the Roman empire became Christian Palmyra was made a bishopric. When the Moslems conquered Syria Palmyra also submitted to them. From the 15th century it began to sink into decay, along with the rest of the Orient. Magnificent remains of the ancient city still exist, chief among them being the great temple of the Sun (or Baal); the great colonnade, nearly a mile long, and consisting originally of some 1500 Corinthian columns; and sepulchral towers, overlooking the city. The ancient Palmyrenes, besides conducting and controlling the caravan trade across the desert, extracted salt, tanned leather, and worked in gold and silver.

See Wood, Bouverie, and Dawkins, *Ruins of Palmyra* (1753); Seiff, *Reisen in der Asiatischen Türkei* (1875); and the account of Prince Abamelek-Lasareff of his explorations (in Russian, 1885).

Palmyra Wood, properly the wood of the Palmyra palm (see PALM, p 723); but the name is generally used for all kinds of palm-tree wood imported into Britain; much of which is the wood of the cocoa-nut palm, *Cocos nucifera*, and the allied species *C. plumosa*.

Palni Hills, a range of Southern India, linking the southern extremities of the Eastern and Western Ghâts; average height of the higher ridge, 7000 feet. The climate of the Palni Hills is singularly pleasant and equable, many preferring the sanatorium of Kodaikanal to Ootacamund.

Palo Alto, 30 miles from San Francisco, the seat of a university founded at a cost of upwards of \$15,000,000 by Senator Leland Stanford. The institution is to provide, entirely gratis, education from the Kindergarten stage to the most advanced instruction that human teachers can supply; and all the pupils are to board on the premises, at the smallest possible charge.

Palolo (*Palolo viridis*), an edible annelid, allied to the Lug-worm, extremely abundant at certain seasons in the sea above and near the coral-reefs which surround many of the Polynesian Islands. The body is cylindrical, slightly tapering at both ends, divided into nearly equal joints, each joint with a small tuft of gills on each side. In thickness the palolo resembles a very fine straw; in length it varies from 9 to 18 inches. These annelids make their appearance in great multitudes, apparently rising out of the coral-reefs, and with a periodical regularity which is very remarkable. They are eagerly sought after by the islanders, who are on the watch for their appearance, and go out in canoes before sunrise to take them by means of nets; but they often occur in such

Portico of the Great Colonnade.

city of northern Syria, situated in an oasis on the northern edge of the Arabian desert, about 150 miles NE. of Damascus and nearly midway between that city and the Euphrates. The Semitic name was Tadmor, Palmyra (= 'city of palms') being the Greek and Latin equivalent. According to the old tradition, it was founded by Solomon. There is stronger probability that it was an

numbers that the water seems to be full of them, and they may be grasped by handfuls. After sunrise the creatures break

into pieces and the shoals are not seen till the next period, which seems to have a definite relation to the lunar time; the two stated periods being in October and again in November.

Palos, a small Spanish port at the mouth of the Rio Tinto, and 5 miles SE. of Huelva. Once an important place, from whence Columbus started on his great voyage, it has now sunk to a village of 1200 inhabitants.

Palpitation is the term used of the condition in which a person becomes painfully aware of the beating of his own heart. This occasionally happens even when the heart's action is appar-

a, *Palolo viridis*, half natural size; b, c, anterior and posterior extremities (mag.).

ently quite natural; but much more generally the pulsations are found to be greatly increased in force, and in most cases in frequency as well. It may be either functional or a symptom of organic disease of the heart. Here we shall merely consider it as a functional disorder. Although it may be persistent, it far more frequently comes on in paroxysms, which usually terminate within half an hour, recurring afterwards quite irregularly, sometimes daily or several times a day, and sometimes not till after a long interval. The attack often comes on under some mental or physical excitement, but sometimes when the patient is quite composed, or even asleep. If the paroxysm is a severe one the heart feels as if bounding upwards into the throat; and there is a sensation of oppression over the cardiac region, with hurried or difficult respiration. Excluding organic diseases, the causes of this affection are either (1) an abnormally excitable condition of the nerves of the heart, or (2) an unhealthy condition of the blood.

(1) Amongst the causes of disturbed innervation may be especially noticed the abuse of tea (especially green tea), coffee, spirits, and tobacco. Any irritation of the stomach and intestinal canal may be reflected to the heart; and hence palpitation may frequently be traced to flatulence, undue acidity, and intestinal worms, especially tapeworms. Everything that causes pressure on the heart, such as tight-lacing, abdominal dropsy, or an enlarged uterus, is also liable to occasion this affection.

(2) If the blood is abnormally rich and stimulating it may give rise to palpitation, as in Plethora (q.v.); but the opposite condition, known as Anæmia (q.v.), is a much more common cause of this affection. In anæmia the blood is watery and deficient in fibrine, and (far more) in red colouring matter; and, being thus in an unnatural state, it acts as an unnatural stimulant, and induces frequent and abnormally strong pulsations.

The age at which palpitation most usually comes on is from fifteen to twenty-five; and the affection—especially if it arise from anæmia—is very much more common in the female than in the male sex.

The treatment of palpitation must entirely depend upon its cause. The use of all nervous stimulants (tea, coffee, alcohol, and tobacco) should be suspended or abandoned. If the patient is clearly

plethoric, with a full strong pulse, he should take saline cathartics, and live upon comparatively low diet (including little animal food) until this condition is removed. When, on the other hand, the palpitation is due to an anæmic condition, the remedies are preparations of iron, aloetic purgatives, an abundance of animal food, bitter ale, the cold shower-bath, and moderate exercise.

Palsy. See PARALYSIS.

Paltock, ROBERT, born in London apparently in 1699, and educated at St Paul's School, was bred to the law, and while in Clement's Inn secured his title to remembrance by writing the wondrous tale of *Peter Wilkins, a Cornish Man*, published anonymously in 1750, and often reprinted. The authorship, known to some in 1802, remained generally a mystery till 1835, and first appeared on the title-page in 1839. Paltock died 20th March 1767. See the preface to A. H. Bullen's edition of *Peter Wilkins* (2 vols. 1884), and *Athenæum*, August 1884 to February 1885.

Paludan-Müller, FREDERIK, Danish poet, born at Kjerteminde in Fünen, on 7th February 1809, led a quiet, uneventful life, and died at Copenhagen on 29th December 1876. Whilst still a student at the university in that city he gained the ear of the public with a play, *Love at Court* (1832); a poem, *The Dancer* (1833); and a lyric drama, *Amor and Psyche* (1834; 8th ed. 1883)—all three decidedly romantic in temper, the second especially showing Byronic influence. But his fame rests on *Adam Homo* (3 vols. 1841-49; 7th ed. 1885), a humorous, didactic poem, full of deep and suggestive thought, with no small share of satiric wit and irony, and strong realistic touches, and of the most finished literary workmanship; on *Kalanus* (1854), a contrast between Alexander the Great and the Indian sage Kalanus, as representatives of Greek culture and Hindu religion, a work written in the loftiest spirit of idealism; and on *Adonis* (1874), an exquisitely finished little mythological poem. Along with *Kalanus* he published the poems *Paradise*, *Abel's Death*, *Cain*, *Ahasuerus*, and *Benedict of Nursia*; and he wrote also two prose romances, *The Source of Youth* (1865) and *Ivar Lykke's History* (3 vols. 1866-73). His poetical works were published in 8 vols. in 1878-79. See Georg Brandes, *Danske Digtere* (1877).

Pamir ('roof of the world'), the nucleus of the central Asian highland system, is a lofty plateau-region, with a mean elevation of 13,000 feet, uniting the western terminations of the Himalaya and the Tian-Shan Mountains, and both with the Hindu-Kush. It is traversed by mountain-ridges that rise from 4000 to 5000 feet above the plateaus, and the culminating points attain in some cases 25,500 feet above sea-level. Between these ridges are a series of broad valleys, to which the generic name 'pamir' is given. On the west side this plateau-region sinks rapidly in terraces to the deserts of Turkestan. These lofty plateaus are exposed to great extremes of heat and cold, and are visited by terrible snow and sand storms. Nevertheless the Kirghiz drive up their flocks and herds for summer pasture, and from time immemorial traders have crossed them along celebrated routes. It was crossed by the famous Marco Polo on his journey to the court of Kublai Khan. Animal and bird life is plentiful, the moufflon having its home there. There are numerous rivers and lakes, some of the latter of great size, as Karakul, 120 sq. m., and Shivakul, 100 sq. m. See Geiger, *Die Pamirgebiete* (1887).

Pamllico Sound, a shallow body of water, some 75 by 10 to 25 miles, on the coast of North Carolina, separated from the ocean by long, narrow islands of sand, with narrow passages.

Pampas (*Quichua*, 'plains') is a term properly confined to the immense treeless plains of the Argentine Republic, which rise, almost imperceptibly, in a series of terraces from the coast to the base of the Cordilleras. Extending some 2000 by 500 miles, they differ greatly in various districts. The north-eastern portion, in the Paraná basin, is one of the most fertile regions in the republic; and stretching from this through Buenos Ayres and the south of Cordova and Santa Fé is the rich grassy pampa-land proper, supporting great herds of cattle, horses, and sheep. The rest is for the most part waterless and sterile. The soil, which is a diluvium composed of sandy clay, and abounds in the bones of extinct mammals, is more or less impregnated with salt, especially in the west, where strips of desert, known as *travesias*, are numerous. Within recent years great tracts of pasture have been converted into farm-land, but stock-raising is still the most important industry. The half-white herdsmen are called *Gauchos* (q.v.).—The name Pampas is also given to the level districts of Peru, where those of the Sacramento occupy an area estimated at 180,000 sq. m., covered with primeval forest.

Pampas Grass (*Gynerium argenteum*), a grass which covers the pampas of South America. A noble grass now well known in British gardens as an ornamental plant, it is quite hardy, and its tufts have a splendid appearance. The leaves are 6 or 8 feet long, the ends arching gracefully over; the

Pampas Grass (*Gynerium argenteum*).

flowering stems 10 to 14 feet high; the panicles of flowers silvery white, and from 18 inches to 2 feet long. The male and female flowers are on separate plants; the spikelets two-flowered, one floret stalked, and the other sessile; the palea of the female florets elongated, awn-shaped, and woolly. The herbage is too coarse to be of value. The plant is now cultivated at Goleta, California, for the sake of its plumes, which are vended by florists for room decoration. Their culture and preparation for market form a considerable industry.—Another species of the same genus, *G. saccharoides*, a Brazilian grass, yields a considerable quantity of sugar.—A decoction of the root of *G. parviflorum* is used in Brazil to strengthen the hair.

Pampas Hare. See VISCACHA.

Pampeluna, or PAMPLONA, a fortified city of northern Spain, stands on a tributary of the Ebro, 111 miles by rail NW. of Zaragoza (Saragossa) and 50 S. by W. of Bayonne in France. It has a citadel (a copy of that of Antwerp), a Gothic cath-

edral (1397), a viceregal palace, a fine aqueduct, a natural history collection, a college of surgery, and a bull-ring, manufactures of pottery, leather, cloth, hardware, &c., and a trade in wine. It was called by the ancients *Pompeopolis*, because built by Pompey in 68 B.C. It was taken by the Goths in 466, by the Franks in 542, and by Charlemagne in 778. From 907 it was the capital of Navarre. It was during the siege by the French in 1521 that Loyola (q.v.) received his wound. The town was seized by the French in 1808, and held by them till 1813, when it was captured by Wellington. It again capitulated to the French in 1823. In the Carlist wars it was held by Queen Christina's adherents from 1836 to 1840, and in 1873-76 it was vainly attacked several times by the Carlists. Pop. 25,630.

Pamphlet. The word is used by Hocleve in 1411, who applies the name 'pamflet' to his rather long poem *De Regimine Principum*, and by Caxton, who spells it 'paunflett.' Beyond this we know nothing for certain—the ultimate origin may be *Pamphila*, the name of a first-century writer of epitomes. In the 15th century the word was applied chiefly to short poems, and the modern meaning was only gradually assumed. Davies (1715) in his *Icon libellorum, or Critical History of Pamphlets*, defines it as 'any little book or small volume whatever, whether stitched or bound, whether good or bad, whether serious or ludicrous, whether esteemed or slighted.' It is evident, however, that some literary characteristics must be added in order to exclude sermons, academic dissertations, chap-books, broadsides, &c. The pamphlet has a distinct aim, it relates to some matter of current interest, religious, political, or literary, and, whether didactic, religious, or controversial, is the spontaneous expression of one who seeks to excite or change some popular feeling or opinion. In England the history of pamphlets would be the history of the thought of the people. From the tracts of Wyclif and his followers in the 14th century to the *Tracts for the Times* in the 19th, from the heights of noble enthusiasm in Milton's *Areopagitica* and *Tract on Education* to the most scurrilous of party pamphlets, all reflect, or appeal to, some phase of popular feeling. One of the earliest and most effective of such appeals to the public precipitated the course of ecclesiastical events in the 16th century—i.e. the *Supplication for the Beggars*, in which Simon Fish (1523) sharply satirised the 'bishops, abbots, priors, monks, and generality of the clergy.' A copy of this was sent to Anne Boleyn, and 'divers copies scattered in the streets of London.' To this Sir Thomas More replied with his *Supplication of Soules*. Then followed an unceasing flow of Puritan pamphlets, and in 1587 the famous Martin Marprelate series commenced, and in 1657 the *Killing no Murder* attracted more attention than any other political writing of the time. The enormous collection of publications, chiefly pamphlets, made by Thomason the bookseller, now in the British Museum, ranging merely from 1640 to 1662, yet filling 2000 volumes, tells the history of the Civil War from day to day. The *Pamphleteer*, 1813-28, in twenty-nine volumes, contains the best pamphlets of that period, and is full of material for history. In our day the multitude of quarterly reviews, monthly magazines, and weekly papers gives to authors a more certain and a more extensive circulation; yet the pamphlet reappears whenever popular feeling is really aroused, or in the propaganda of such causes as anti-vivisection, anti-vaccination, and the like. Some prolific topics have been the Bullion Question (1810), the Poor Laws (1828-34), Tracts for the Times (1833-45), the Canadian Revolt (1837-38), the Corn Laws (1841-48), the Crimean War and the Indian

Mutiny (1854-59), Ireland (1868), the Franco-German War (1870-71), the Vatican Decrees (1874-75), the Eastern Question (1877-80), the Irish Land Laws (1880-82).

Pamphylia, anciently a country on the south coast of Asia Minor, with Cilicia on the east and Lycia on the west. It was originally bounded on the inland or northern side by Mount Taurus, but afterwards enlarged, so as to reach the confines of Phrygia. Pamphylia is mountainous, was formerly well wooded, and had numerous maritime cities. The inhabitants—a mixed race of aborigines, Cilicians, and Greek colonists—spoke a language the basis of which probably was Greek, but which was disfigured and corrupted by the infusion of barbaric elements. See Dr Lanckorowski, *Die Städte Pamphyliens und Pisidiens* (1890 et seq.).

Pan, among the Greeks, a divinity of pastures, forests, and flocks, usually described as a son of Hermes. His worship originated in Arcadia, but spread gradually over the rest of Greece, although it did not reach Athens until after Marathon. Pan is represented as having horns, a goat's beard, a crooked nose, pointed ears, a tail, and goat's feet. Sometimes he appeared to travellers, startling them with sudden fear, whence a sudden fright was called a *panic* fear. During the heat of the day he used to sleep in the shady woods, and was exceedingly wroth if his slumber was disturbed by the halloo of the hunters. He was the patron of all persons occupied in the care of cattle and of bees, in hunting and in fishing. He is also represented as fond of music, and of dancing with the forest nymphs, and as the inventor of the syrinx or Pan-dean pipes. Cows, goats, lambs, milk, honey, and new wine were offered to him. The fir-tree was sacred to him, and he had sanctuaries and temples in various parts of Arcadia, at Trœzene, at Sicyon, at Athens, &c. The Romans identified the Greek Pan with their own god Faunus. Plutarch (*De Orac. Defectu*) is the first to tell the story that in the reign of Tiberius one Thanus a pilot, when steering near the islands of Paxæ, was commanded by a loud voice to proclaim that 'the great Pan is dead.' As soon as he had reached Palodes he cried the news aloud from the poop of his ship, whereupon was heard a great noise of lamentation, as of nature itself expressing its grief. The coincidence of this story with the birth or the crucifixion of Christ gave occasion to an explanation that it marked the end of the old world and the beginning of the new when the old oracles became dumb. Rabelais has the story, there is a well-known allusion to it in Milton's *Ode on the Nativity*, and it has been finely treated by Schiller and Mrs Browning. The Devil of popular Christian superstition owes some of his attributes to Pan.

Panamá, ISTHMUS OF, formerly called the Isthmus of Darien (q.v.), embraces the narrowest part (35 miles) of Central America, connecting Costa Rica on the W. with Colombia on the E. It now forms a department of Colombia, has an area of 31,880 sq. m., and a pop. of 285,000, with 8000 uncivilised Indians, and is traversed by a low chain of mountains, forming the barrier between the Atlantic and Pacific Oceans. Numerous streams, the largest of which is the Tuira (160 miles long, and navigable for more than 100 miles), fall into both oceans. Off the Pacific shore are numerous beautiful islands, among which Las Perlas, so called from their pearl-fisheries (now almost discontinued), Naos, and Taboga are the chief. There are no good natural harbours. The chief trading ports are Panamá (see below) and Colon (Aspinwall). The exports embrace hides, tallow, caoutchouc, indigo, vanilla, coffee, gold dust, cocoa-nuts, tortoiseshell, &c. Commerce is entirely

in the hands of foreigners, and is valued at less than £1,400,000 annually. Gold, once abundant, is still worked, and copper, iron, coal, &c., exist. 'Panamá hats' are made in Ecuador and Peru.

PANAMÁ, the capital of the department, stands on a projecting volcanic rock on the Pacific side of the Isthmus; the massive walls the Spaniards built to protect their treasure city still stand in places. *Old Panamá*, founded in 1518, was captured and destroyed by the buccaneers under Morgan (1671). *Modern Panamá* was built two years later, 4½ miles distant from the old city. In May 1880 it had a population estimated at 15,000, the majority of Indian and negro descent, and half-breeds. During the zenith of canal work (see below) the population was estimated at 25,000 to 30,000. Fires have destroyed Panamá repeatedly, as well as its sister city Colon. The principal buildings are the cathedral (1760), a Spanish structure, built of yellow stone; the town-hall, in which the Colombians signed the declaration of their independence; and the bishop's palace (1880). Panamá is connected with Colon on the Atlantic by the Panamá Railway (48 miles long), built by Americans in 1850-55.

PANAMÁ CANAL.—The idea of connecting the Atlantic and Pacific Oceans by way of the central American isthmuses is by no means new. That for uniting them by the Isthmus of Panamá is almost coincident with Balboa's discovery of the Pacific (1513). In King's *Wonders of the World* we read: 'In the town library of Nuremberg is preserved a globe, made by John Schöner in 1520. It is remarkable that the passage through the Isthmus of Darien, so much sought after in later times, is on this globe carefully traced.' Gomera (1510-60), the historian, was the first to advocate a union of the oceans by means of a canal. Philip II. of Spain proved an implacable enemy to all such schemes. The Tehuantepec, Nicaragua, and Darien routes were discussed in the 16th century; and the Dutch, it is alleged, made complete plans for a canal over two centuries ago. But no steps were taken to carry out any plan until Ferdinand de Lesseps, of Suez fame, convened in Paris in May 1879 an international congress to discuss the plan of cutting through the Isthmus of Panamá. A plan previously prepared by De Lesseps was adopted, and a concession from the United States of Colombia to Lieutenant Lucien Napoleon Bonaparte Wyse of the French navy, who had made a hasty and partial survey, was sold to the prospective Panamá Canal Company. On February 28, 1881, the first detachment of canal employés arrived at Colon; surveys were at once made, and the building of camps, hospitals, &c. followed. In 1882 the Canal Company purchased the Panamá Railway. De Lesseps' Engineering Commission to Panamá in 1880 estimated that a canal could be made for 843,000,000 francs. De Lesseps reduced their figures to 600,000,000 francs, or £24,000,000, and announced that a *canal à niveau*, or tide-level canal, could be completed for that sum. Later he invited delegates to meet him at Panamá in 1888 for its opening. Loans followed year after year. Meantime interest charges accumulated and became burdensome, while little real progress was made. In the autumn of 1888 further borrowing became impossible. The company was forced into liquidation, January 1, 1889; its bond and share indebtedness was roughly estimated at £70,000,000, interest charges over £4,000,000, with perhaps a fifth of the real work done. There are over 800,000 holders of shares in France. Shortly after the crash, a liquidator was named by the Court of the Seine. In 1890 a commission of French and other engineers was sent to the Isthmus by him. Their report was very discouraging. Valuable

plant estimated at about £6,000,000 was rusting away, much already useless. The tide-level cut at Colon was rapidly filling in, and the fine harbour shallowing, owing to the cut. In 1891 the government of Colombia granted to the Panamá Canal Company an extension of ten years from 1893 in which to finish their contract, provided operations should be resumed before February 1893. De Lesseps seems to have entered upon the plan without sufficient knowledge. It is also alleged that much money was squandered through extravagance and incapacity. Moreover, many hundreds of the workmen were swept away by tropical diseases, yellow and pernicious fevers, dysentery, &c., the climate of the Isthmus being pestilential and death-dealing. Indeed the Isthmus and its towns are hotbeds of malignant disease, which is distributed thence by passing merchandise to all quarters.

Great and apparently insurmountable obstacles to a tide-level canal are the marshes and quicksands on the Atlantic coast. The unruly Chagres periodically overflows, and fills the valley of the Isthmus. In 1879 a flood lasting four days swept all before it, and covered the railway with 12 feet of water. Then there are serious natural obstacles in the line of the canal, as the swamps and volcanic ledges on the Panamá side. Earthquakes, too, occur; in September 1892 much damage was done to both Isthmian cities and the Panamá Railway by a severe earthquake, whilst a tidal wave swept the islands and coast of the Gulf of Darien on the Atlantic side, causing great destruction of life and property. To natural obstacles must be added the great cost of labour and living. The long wet season of nearly eight months causes delays and damages to cuttings. See Dr W. Nelson, *Five Years at Panamá* (New York, 1889; Lond. 1891).

Panama Crimson. See DYEING.

Panathenæa, the most famous festival of Attica, celebrated at Athens in honour of Athena, patron goddess of the city. All writers who mention it speak of a Lesser and Greater Panathenæa, the former held annually, the latter every fourth year. The procession of the festival was sculptured by Phidias and his disciples on the frieze of the Parthenon.

Panax. See GINSENG.

Panchatantra, the oldest extant collection of apologues and stories in Sanskrit literature. This work is a compilation due to a Brahman named Vishnuserman, who is represented as at once the narrator of the stories and author of the book. Composed of narratives, some of which are found in different literary monuments, and of passages borrowed from legislators, moralists, and poets, the Panchatantra has been subjected to many modifications. Wilson, who first gave a detailed analysis of the work (*Trans. Roy. Asiat. Soc. of Great Britain*, i., Lond. 1827), had three widely varying MSS. before him. Kosegarten, the first editor of the Sanskrit text, found the same variety in the eleven MSS. he used. In these he recognised two distinct redactions, one simple and without ornament, the other more extended and elaborated. Neither of these is, however, the first form of the work. Benfey held that there existed a still more ancient text, from which the lost Pehlevi translation was made, and that the Panchatantra was composed subsequent to that translation. This Pehlevi version was the parent of the Arabic *Kalilah wa Dimnah*, as also of the old Syriac version of Bickell and Benfey (1876). The book of *Kalilah wa Dimnah* differs considerably from the Panchatantra. It is divided into eighteen chapters, of which only five (5, 7, 8, 9, 10) correspond to the five parts of our collection. The

literary history of this work and its extraordinary diffusion among the languages of western Europe are sketched in the article BIDPAI.

Some of the fables contained in the Panchatantra are found in the Mahābhārata, others have their source in Buddhist books, and there exist in Sanskrit several abridgments or imitations. Of these the most ancient forms part of the Kathāsarit-sāgara ('Ocean of the Streams of Story'), composed by Somadēva about the beginning of the 12th century. The text of this work was edited by H. Brockhaus (Leip. 1839-62-66); a German translation by the same scholar was published in 1839 (Leip. 2 vols.), and one in English by Professor C. H. Tawney in 1880 (Calcutta, 2 vols.). It contains, of the Panchatantra, the first three books, three fables of the fourth, and one of the fifth. Another abridgment, in which most of the poetical quotations are omitted, is entitled *Kathamritanidhi* ('Treasure of the Ambrosia of Stories'). But the most celebrated of its imitations is the *Hitopadēsa* ('Useful Instruction'), of comparatively modern date. Like Somadēva, its author, Sri Nārāyana, has taken only the first three books of the Indian original; he has drawn from the last two four fables only, and inserted them in his third and fourth books.

The Panchatantra belongs to the class of works designated in India as *Nitisāstras* (*sāstra*, 'book of knowledge,' and *niti*, 'conduct'), composed for the instruction of princes and all those called to take a share in the direction of public affairs. The five books of which it is composed form as many distinct parts, related to each other by an introduction in which a king, after having taken the advice of his councillors, entrusts to a Brahman the education of his three sons. The latter composes the Panchatantra for the instruction of the young princes, and by the reading of that work he succeeds in overcoming their indolence and in developing their faculties.

The first book is the longest, and has for special title *Mitrabheda* ('The Disunion of Friends'). Its object is to acquaint kings how dangerous it is to lend an ear to the perfidious insinuations of those who seek to sow divisions between a prince and his faithful friends. The second book, entitled *Mitrā-prāpti* ('The Acquisition of Friends'), has for its aim to show how advantageous it is to form unions and help each other. The third book, *Kakolūkīya* ('The War of the Crows and the Owls'), shows the danger of trusting to men unknown or to enemies. The fourth, *Labdhapranasana* ('The Loss of Acquired Good'), proves that we often lose by imprudence what we had gained with difficulty. The fifth and last book, *Aparikshitakāritva* ('Inconsiderate Conduct'), shows the danger of being too precipitate in action. A principal apologue forms the subject, or, more correctly, the framework, of each of the five books. Fables contained in that apologue, and often involved the one with the other, are related by the personages introduced. The narrative is intermingled with a multitude of sentences, maxims, remarkable thoughts, extracts from codes of legislators, heroic and other poems, and dramas.

The text of the Panchatantra has been edited by Kosegarten (2 vols. Bonn and Greifswald, 1848-59), and G. Bühler and F. Kielhorn in the 'Bombay Sanskrit' series (1868-69). There is an admirable German translation by Benfey (2 vols. Leip. 1859), a French translation, with useful notes on the sources and imitations of the stories, by Édouard Lancreau (1871). Vol. i. of Benfey's work is entirely taken up by a masterly and exhaustive introduction, the best work that has yet appeared on the sources and the diffusion of Indian fables.

Pancras, ST, the son of a heathen noble of Synnada in Phrygia, lost both parents whilst a

boy, and was taken to Rome by an uncle, and there baptised, but immediately afterwards was slain (304) in the Diocletian persecution, being only fourteen years old. The first church that St Augustine consecrated in England was dedicated to St Pancras; it stood at Canterbury.—The London terminus of the Midland Railway, St Pancras Station, is situated in the parish of St Pancras. See G. Clinch, *Marylebone and St Pancras* (1891).

Pancreas (from the Gr. *pan*, 'all,' and *kreas*, 'flesh') is a conglomerate gland, lying transversely across the posterior wall of the abdomen, varying in length from 6 to 8 inches, having a breadth of about an inch and a half, and a thickness of from half an inch to an inch. Its usual weight is about three ounces. The head of the pancreas lies in the concavity of the duodenum. For the action of the pancreatic juice, and an illustration of the pancreas, see DIGESTION.

The diseases of the pancreas are few, and do not signify their existence by any very marked symptoms. The most common form of disease is cancerous deposit in the head of the gland, which frequently induces jaundice by obstructing the common biliary duct near its opening. An accurate diagnosis of disease of this organ is extremely difficult, and cannot lead to efficient treatment; all that can be done in these cases being to palliate the most distressing symptoms. The pancreas of ruminating animals is a favourite article of food under the name of sweetbread.

Pancsova, a town in the south of Hungary, inhabited by (1880) 17,127 Servians and Germans, stands 9 miles NE. of Belgrade, on the Temes, not far from its junction with the Danube. The people breed silkworms, brew beer, distil brandy, make starch, grind flour, &c. The Austrians took the place from the Turks in 1716, routed them there in 1739, burned the town in 1788, and in 1849 defeated the Hungarians under Kiss.

Panda (*Ailurus fulgens*), a rare and remarkable animal in the bear section of Carnivores. It lives among rocks and trees by the sides of streams at great altitudes in the south-east Himalayas, and

Panda (*Ailurus fulgens*).

in eastern Tibet. Like a large cat in size, it has long, thick, brilliant reddish-brown fur, black beneath, high pointed ears, stout plantigrade limbs, with large, very slightly retractile claws, and woolly soles. The bushy tail is almost as long as the body, and has beautiful rings of red and yellow. The molar teeth are very broad, with numerous cusps; the diet consists of fruits, roots, and other parts of plants. A captive panda in the Zoo in London sucked water like a bear, and ran like a weasel in a jumping gallop. In its native haunts it climbs trees dexterously. The call varies from

a curious bird-like chirp to a loud squeal. By the large bear-like *Ailuropus melanoleucus*, with snow-white fur and black legs, the panda is linked to the bears, but in several features it is nearer the raccoons of the New World.

Pandanaceæ, a natural order of endogenous plants, wholly natives of the tropics. They are trees or bushes, often sending down adventitious roots, sometimes weak and decumbent, or climbing. The leaves are imbricated linear-lanceolate and spiny, or pinnate and palmate without spines. The flowers are unisexual, naked, polygamous, or arranged on a spadix, and wholly covering it. The stamens are numerous; the ovaries usually clustered, one-celled, each crowned with a stigma; the fruit consists of fibrous, one-seeded drupes, collected or almost combined, or of berries with many seeds. There are not quite 100 known species. Some are valuable for the fibre of their leaves, some for their edible fruit, &c. See SCREW PINE. The unexpanded leaves of *Carludovica palmata* furnish the material of which *Panama hats* are made. The tree which yields Vegetable Ivory (q.v.) is *Phyllephas macrocarpa* belonging to this order. The flowers of *Pandanus odoratissimus* are very fragrant; in India they are boiled with meat, and are regarded as aphrodisiac. It is cultivated in some parts of Japan for the sake of the perfume of the flowers, and the adventitious roots are used as substitutes for corks.

Pandavas. See MAHÁBHARATA.

Pandean Pipes, a series, fastened side by side, of short reeds or pipes, graduated in length so as to give out different notes when blown across their mouths. See PAN.

Pandects (Gr. *pandectai*, 'all-containing'), or the DIGEST, one of the celebrated legislative works of the Emperor Justinian (q.v.).

Pandharpur, a town of British India, 112 miles SE. of Poona, on a branch of the Kistna. It is highly revered by the Hindus on account of a temple dedicated to an incarnation of Vishnu. Pop. 16,910.

Pandit. See PUNDIT.

Pandora (i.e. the 'all-endowed'), according to Greek myth, was the first woman on the earth. When Prometheus had stolen fire from heaven Zeus instigated Hephæstus to make woman out of earth to bring vexation upon man by her graces. The gods endowed her with every gift necessary for this purpose, beauty, boldness, cunning, &c.; and Zeus sent her to Epimetheus, the brother of Prometheus, who forgot his brother's warning against accepting any gift from Zeus. A later form of the myth represents Pandora as possessing a vessel or box filled with every form of human ills, on opening which they all spread over the earth, Hope alone remaining. A still later version makes the box filled with winged blessings, which mankind would have continued to enjoy if curiosity had not prompted Pandora to open it, when all the blessings flew out, except Hope.

Pandours, a people of Servian origin who lived scattered among the mountains of Hungary, near the village of Pandour in the county of Solih. The name used to be applied to that portion of the light-armed infantry in the Austrian service raised in the Slavonian districts on the Turkish frontier. They originally fought after the fashion of the 'free-lances,' and were a terror to the enemy whom they annoyed incessantly. Their appearance was exceedingly picturesque, being somewhat oriental in character, and their arms consisted of a musket, pistols, a Hungarian sabre, and two Turkish poniards. Their habits of brigandage and cruelty rendered them, however, as much a terror

to the people they defended as to the enemy, and about 1750 they were put under stricter discipline, and gradually incorporated with the regular army. The name is now obsolete.

Pandulf, CARDINAL, the commissioner sent by Innocent III. to King John in 1213, who returned to England as legate (1218-21), and in 1218 was made Bishop of Norwich. Langton strongly opposed his pretensions as legate, and got his commission cancelled.

Pange Lingua (Lat., 'Now, my Tongue, the mystery telling'), one of the most remarkable of the hymns of the Roman Breviary, and like its kindred hymn, *Lauda Sion*, a most characteristic example of mediæval Latin versification. The Pange Lingua is a hymn in honour of the eucharist, and belongs to the service of the Festival of Corpus Christi. It was written by the great Angelic Doctor, Thomas Aquinas, and consists of six strophes of verses in alternate rhyme. Besides its place in the office of the Breviary, the 'Tantum ergo,' a portion of this hymn, forms part of the service called Benediction with the Blessed Sacrament, and is sung on all occasions of the exposition, procession, and other public acts of eucharistic worship.

Pangeneses. See HEREDITY.

Pangolin, or SCALY ANT-EATER, a name given to the various species of the genus *Manis* belonging to the mammalian order Edentata, and confined to the Oriental and Ethiopian regions. The most

Pangolin (*Manis pentadactyla*).

marked peculiarity of these animals is their covering of scale-like structures, which are really formed of numerous hairs closely fused. The pangolin is most nearly allied to the Aardvark (q.v.) of South Africa, and like it is edentate and feeds upon ants. When threatened with danger these animals roll themselves into a ball like the hedgehog.

Panicle. See GRASSES.

Panicum. See MILLET.

Pāṇini, the greatest known grammarian of ancient India, whose work has up to the present day remained the standard of Sanskrit grammar. Of his life little is known save that he was born near Attock. His date even has not been ascertained. Goldstücker placed him in the 7th century B.C.; Weber and Böhtlingk give about 350 B.C. The precision of statement and analytical skill of his work are equally admirable. See SANSKRIT.

Panipat, a town of the Punjab, is situated 53 miles N. of Delhi, near the old bank of the Jumna, and on the great military road of northern India between Afghanistan and the Punjab. Hence it has been at various times the scene of strife between the people of India and her invaders. The first great battle of Panipat was fought in 1526, when Baber, at the head of 12,000 Mongols, defeated the army, 100,000 strong, of the emperor of Delhi. The second great battle was fought in 1556 by the Mongols under Akbar, grandson of Baber, and third of the Mogul emperors, against Hemu, an Indian general of the Afghan Sher Shah, the latter being

defeated. The third battle was fought on 7th January 1761 between Ahmed, ruler of Afghanistan, and the till then invincible Mahrattas, who on this occasion suffered a total defeat and great slaughter. The existing town is enclosed by an old wall, and manufactures copper utensils, cloth, blankets, hardware, silver and glass ornaments. Pop. 25,022.

Panizzi, SIR ANTHONY, principal librarian of the British Museum from 1856 to 1866, was born 16th September 1797, at Brescello, in the duchy of Modena. He studied at Padua, and became an advocate, but, sharing in the revolution of 1821, had to flee. Condemned to death in absence, he settled in Liverpool, where the friendliness of Roscoe procured him employment as a teacher of Italian. Through Brougham's help he was in 1828 made professor of Italian in University College, London, and in 1831 assistant-librarian in the British Museum. As keeper of the printed books (1837) he undertook the new catalogue, and it was he who designed the new reading-room (see BRITISH MUSEUM). He was long a fast friend and correspondent of Prosper Mérimée, and died April 8, 1879, having been made K.C.B. in 1869. He retained to the end a lively interest in the cause of Italian freedom. See his *Life* by Fagan (1880).

Panjab. See PUNJAB.

Panjim. See GOA.

Panna, capital of a small native state in Bundelkhand, 173 miles SW. of Allahabad. Pop. of town, 14,676; of state (1881) 227,306.

Pannonia, a province of the ancient Roman empire, bounded on the N. and E. by the Danube, on the W. by the mountains of Noricum, and on the S. reaching a little way across the Save; it thus included part of modern Hungary, Slavonia, parts of Bosnia, of Croatia, and of Carniola, Styria, and Lower Austria. It received its name from the Pannonians, a race of doubtful origin, but who at first dwelt in the country between the Dalmatian Mountains and the Save, in modern Bosnia, and afterwards more to the south-east in Moesia. The Roman arms were first turned against them and their neighbours, the Iapydes, by Augustus in 35 B.C. After repeated defeats the Pannonians settled about 8 A.D. in the more northern countries, which received their name, and of which the former inhabitants, the Celtic Boii, had been in great part destroyed in Caesar's time. The country was now formed into a Roman province. Great numbers of the Pannonian youth were drafted into the Roman legions. In the 5th century it was transferred from the Western to the Eastern Empire, and afterwards given up to the Huns. After Attila's death, in 453, the Ostrogoths obtained possession of it. The Longobards under Alboin made themselves masters of it in 527, and relinquished it to the Avari upon commencing their expedition to Italy. Slavonian tribes also settled in the south. Charlemagne brought it under his sceptre. In the reigns of his successors the Slavonians spread northward, and the country became a part of the great Moravian kingdom, till the Magyars or Hungarians took it in the end of the 9th century.

Panorama (Gr. *pan*, 'all,' and *horama*, 'a view'), a word coined by or for Barker in 1788 to mean 'a view all round.' The word is used loosely for all that the eye can see at once, or by a person's simply turning round, from an eminence; also for a series of pictures, such for example as what is called a 'panorama of the Rhine,' folded up in a kind of portfolio. The name is also given to a continuous series of painted pictures exhibited at one end of a room, and moved so as successively to pass into and out of the field of view by some mechanical arrangement. This when seen from a distance

through an opening, and under a combination of direct and reflected light (as invented by Daguerre and Bouton), is called a *diorama*. But the word panorama properly belongs to what is now called, by way of distinction, *cyclorama*—a continuous painting on the interior of a cylindrical surface, the spectator standing in the centre. It is claimed that Breising of Danzig proposed such a plan. But Robert Barker (1739–1806), an Irish painter resident in Edinburgh, is entitled to the credit of having not merely conceived the method, but of having successfully carried it out on a large scale; his first 'panorama' being a view of Edinburgh, painted in water-colour on paper pasted on a cylinder of canvas 25 feet in diameter, and exhibited in Edinburgh in 1788. This he took to London in 1789; and in 1798 he erected a special building, one of the rooms of which admitted a circular picture 90 feet in diameter. Robert Fulton is said to have painted and exhibited shortly after this the first panorama seen in Paris. But on the Continent the panorama in this sense first became very popular after the Franco-German war of 1870–71. In various towns of Germany and in Paris panoramas of the war were exhibited in buildings specially built for the purpose; the Parisian one of the siege of Paris being enormously successful. In the United States also large panoramas have been exhibited, the subjects being battle-scenes from the civil war. A large panorama of the battle of Bannockburn, painted by Fleischer of Munich, was shown in a specially erected building in Glasgow in 1888; and one of the battle of Trafalgar, by the same artist, was a feature of the Edinburgh Exhibition of 1890. In the same year Niagara was brought on canvas to London, and in 1891 this was succeeded by a view of Jerusalem on the day of the Crucifixion. *Georama* is the name given to a delineation of the earth's surface on the interior of a hollow sphere, the spectator being in the centre of the whole (see GLOBES).

Panormus. See PALERMO.

Panslavism, a movement with the aim of drawing closer together all the various races of Slavonic stock, and combining their influence in political and other directions. Some extreme Slavophiles have even proposed an actual amalgamation in nationality, language, literature, and religion. The first literary representative was the Slovak poet Kollar (q.v.), and the movement showed first in Bohemia (q.v.), where the philological and historical work of Schafarik and Palácky contributed to give it impetus. The Poles of Prussia resisted Germanisation; Serbs, Slovaks, and Croats asserted their rights against their Magyar masters; and the still less fortunate Slavs of Turkey gladly swelled the chorus. But at the first great Panslavic congress at Prague in 1848 the most convenient medium of intercourse proved to be the tongue of the alien Germans! Russia, after being called to suppress the Hungarian revolution, came to be regarded as the protector of all Slavs; and the papers and periodicals of Russian Slavophiles, such as Aksakoff and Katkoff, heartily promoted this growing feeling. The growing dominance of Russia caused the Poles to withdraw their hearty support, and even the Czechs began to fear that Panslavism, under Russian guidance, looked like Panrussism. There were no Poles at the second congress at Moscow in 1867; but Russia found a most receptive field for her propaganda in Bulgaria, Serbia, and Macedonia. And in the recurrent crises of the Eastern Question (q.v.) Russia became more pronouncedly the protector of all Eastern Christians. The Austrian Slavs felt themselves put into the background by the re-constitu-

tion of the Austro-Hungarian monarchy in 1867, which gave so much more power to the Magyars. The war in the Balkan Peninsula in 1875–78 was doubtless largely due to Panslavist intrigue as well as to Christian grievances; but the rearrangements that have taken effect since the Berlin treaty, especially the resolute self-assertion of the Bulgarians, have somewhat disillusioned Russian Panslavists. See SLAVS, RUSSIA; and Häusler, *Der Panslawismus* (Berlin, 1886 et seq.).

Pansy. See VIOLET.

Pantagraph, or PANTOGRAPH (Gr. *panta*, 'all'; *graphein*, 'to delineate'), an instrument invented for the purpose of making copies, reduced or enlarged, of drawings or plans. It is made in various forms, one of which is shown in the figure. Four rods are so hinged to one another that AE is equal to DF, and AD to EF; hence ADFE is always a parallelogram. If from a given point C on AE any straight line BH (or *a*, *b*) be drawn, cutting the other arms,

the triangle ABC will always, no matter how the arms of the instrument be moved, be equal to the triangle DBH. It follows that, if the instrument be pivoted on a point at B (usually by a weight), a pencil-point inserted at H and a tracing-point at C, and the latter traced over the lines of a drawing, the pencil-point at H will trace a reduced copy of the drawing. The proportion of the reduction will be as BH is to BC. B and H are made to slide on their respective rods, so that any proportion of reduction can be made. By changing the places of the pencil and tracing-point, an enlarged copy may be made. The instrument is fitted with little castors to facilitate its free motion. The pantagraph was invented by the Jesuit Christoph Scheiner prior to 1631, and improved by Professor W. Wallace of Edinburgh prior to 1831.

Enlargements or reductions can now be done so much more accurately by means of photography that the pantagraph is nearly obsolete. See COPYING.

Pantellaria, a volcanic island in the Mediterranean, 36 miles in circumference, and lying 60 miles SW. of the Sicilian coast. The chief products are wine, oil, cotton, and fruit.

Panthalops. See CHIRU.

Panthays, a Mohammedan community occupying the province of Yun-nan in the south-west of China, who asserted their independence in 1855. In 1859 they captured Talifoo, the second city of the province, and in 1858 the capital. Their leader Wen-soai (King Suleiman) established his authority over about 4,000,000 of people, of whom not above a tenth were Mohammedans. In 1866 the Chinese government recognised the independence of the Panthays, and in 1872 their king sent his son Hassan on a mission to Europe. Meanwhile the Chinese again attacked the Panthays, defeated them utterly, and finally suppressed their empire. Panthays is

an anglicised form of *Pan-ai*, the name by which the Mohammedans called themselves.

Pantheism (Gr. *pan*, 'all,' and *theos*, 'God'), the name given to that system of speculation which, in its spiritual form, identifies the universe with God (*akosmism*), and, in its more material form, God with the universe. It is only the latter kind of pantheism that is logically open to the accusation of atheism; the former has often been the expression of a profound religiosity. The word Pantheist is comparatively modern, and seems to have been coined by the Deist John Toland in 1705, and is used shortly after that date by his opponents and orthodox writers like Waterland. Earlier pantheistic systems, such as Spinoza's, were regularly assailed under the name of atheism. But the antiquity of this mode of belief is undoubtedly great; it is prevalent in one of the oldest known civilisations in the world—the Hindu. Though it may dimly underlie various polytheistic systems, it is obviously in any definite shape a later development of thought than polytheism, and most probably originated in the attempt to divest the popular system of its grosser features, and to give it a form that would satisfy the requirements of philosophical speculation. Hindu pantheism as *akosmism* is taught especially by the Upanishads, the Vedānta and Yoga philosophies, and by those poetical works which embody the doctrines of these systems; for instance, the Bhagavad Gītā, which follows the Yoga doctrine. It is poetical and religious, rather than scientific, at least in its phraseology; but it is substantially similar to the more logical forms developed in Europe. The Hindu thinker regards man as born into a world of illusions and entanglements, from which his great aim should be to deliver himself. Neither sense nor reason, however, is capable of helping him; only through long-continued, rigorous, and holy contemplation of the supreme unity (Brahma) can he become emancipated from the deceptive influence of phenomena, and fit to apprehend that he and they are alike but evanescent modes of existence assumed by that infinite, eternal, and unchangeable Spirit who is all in all. Hindu pantheism is thus spiritual in its character; matter and (finite) mind are both alike absorbed in the fathomless abyss of illimitable and absolute being. Buddhism (q.v.) denies or ignores the existence of God, but in many modes of regarding the universe is rather akin to pantheism than to absolute atheism. Sufism is a pantheist outgrowth of Islam.

Greek pantheism, though it doubtless originated in the same way as that of India, is at once more varied in its form, and more ratiocinative in its method of exposition. The philosophy of Anaximander may be described as a system of atheistic physics or of materialistic pantheism. Xenophanes, the founder of the Eleatic School (q.v.), has been held to be the first classical thinker who promulgated the higher or idealistic form of pantheism. Alexandrian Neoplatonism is substantially pantheistic; the universal reason and the world-soul of mediæval thinkers have the same tendency.

The Mosaic account of the Creation (q.v.) of all things out of nothing by God expressly excludes any pantheistic cosmogony; and Christian controversialists strenuously assert against every form of pantheism that it involves an antichristian theory of the origin of Evil (q.v.), subverts the personality of God and man, renders free-will impossible (see WILL), and destroys all real moral responsibility. Many heresiarchs have been pantheists. Gnosticism is based on an essentially pantheistic doctrine of emanation. Dionysius (q.v.) the Areopagite and Scotus Erigena (q.v.) were pantheists within the Christian fold; and the later Christian Mysticism (q.v.) has a highly pantheistic flavour

(see ECKHART, BOEHME). Bruno, Vanini, and Paracelsus were outspoken pantheists; and there were various minor pantheistic sects in the middle ages. Spinoza is perhaps the greatest, certainly the most rigorous and precise of the whole class that either the ancient or the modern world has seen. Schelling's Nature-Philosophy proposed to limit the meaning of the term pantheism to the doctrine of the immanence of all things in God, but leaving doubtful the precise scope of what was meant by immanence; and some forms of Hegelianism are directly pantheistic in character. Neither England, France, nor America has produced a single great pantheistic philosopher; but there is an immense amount of pantheistic sentiment floating about in the poetry, criticism, theology, and even in the speculative thinking of these and all European countries in the present age.

See the articles on the thinkers mentioned, and those on PHILOSOPHY, RELIGION, and THEISM; the works on Pantheism by Jäsche (1826-32), Böhmer (1851), Weissenborn (1859), and Driessenberg (1880); Saisset, *Modern Pantheism* (Eng. trans. 1863); Fellens, *Le Panthéisme* (1873); Hunt, *Pantheism and Christianity* (1866; 2d ed. 1884); Flint, *Anti-Theistic Theories* (1877); Plumptre, *History of Pantheism* (2 vols. 1881).

Pantheon (Gr. *pan'theion*), a temple built in a modified Corinthian style with a great vaulted roof, dedicated to all the gods. The 'Pantheon'

Half-section of Pantheon (from Ferguson).

of Rome is the only ancient edifice in Rome that has been perfectly preserved, and is lighted through one aperture in the centre of its magnificent dome. It was erected by Agrippa, son-in-law of Augustus, 27 B.C. In 610 it was consecrated as a church, and is known as Santa Maria Rotonda. Under Pope Urban VIII. the architect Bernini erected on it two little Campaniles, called in derision his 'ass's ears.' Judicious restorations were made by Pius IX., and the ass's ears have been removed. The church is used as a place of sepulture for great Italians.—The Panthéon at Paris, built in 1764 as the church of St Geneviève, became famous as the mausoleum of famous men. From 1851 to 1885 it was again a church.

Panther. See LEOPARD, PUMA.

Pantograph. See PANTAGRAPH.

Pantomime, among the ancient Romans, denoted not a spectacle but a person. The pantomimes were a class of actors who acted wholly by mimicry in gesture, movements, and posturings, corresponding therefore pretty closely to the modern ballet-dancers. When they first made their appearance in Rome cannot be ascertained; probably the *histriones* (Etrusc. *hister*, 'a dancer') brought from Etruria to Rome 364 B.C. were pantomimes; but the name does not once occur during the republic, though it is common enough from the very dawn of the empire. Augustus showed great favour to this class of performers, and is consequently supposed by some writers to have been himself the inventor of the art of dumb acting. The most celebrated pantomimes of the Augustan age were Bathyllus (a freedman of Mæcenas), Pylades, and Hylas. The class soon spread over all Italy and the provinces, and became so popular with the Roman nobles and knights that Tiberius reckoned it necessary to administer a check to their vanity, by issuing a decree forbidding the aristocracy to frequent their houses, or to be seen walking with them in the streets. Under Caligula they were again received into the imperial favour; and Nero, who carried every unworthy weakness and vice to the extremity of caricature, himself acted as a pantomime. From this period they enjoyed uninterrupted popularity as long as paganism held sway in the empire.

As the pantomimes wore masks, no facial mimicry was possible; everything depended on the movements of the body. It was the hands and fingers chiefly that spoke; hence the expressions, *manus loquacissimæ, digiti clamosi*, &c. To such perfection was this art carried that it is said the pantomimes could give a finer and more precise expression to passion and action than the poets themselves. The subjects thus represented in dumb show were always mythological, and consequently pretty well known to the spectators. The dress of the actors was made to reveal, and not to conceal, the beauties of their person; and as, after the 2d century, women began to appear in public as pantomimes, the effect, as may easily be supposed, of their costume, or lack of costume, was prejudicial to morality. Hence pantomimic exhibitions were denounced by the early Christian writers, as they were even by pagan moralists like Juvenal.

The pastoral drama in mediæval Italy gave birth to the opera, and already in the 16th century we find on the Spanish stage ballets with allegorical figures. Into France also about the same time the ballet was introduced. But the improvised Italian comedy was already familiarly known far beyond Italy, with its conventional comic figures, Pantalone and Arlecchino. In England the mask and so-called opera of the 17th century supplied the place of the modern pantomime, which grew out of an attempt to reproduce a popular light dramatic entertainment, varied with song and dance, itself the parent of the modern French *vaudeville*. Colley Cibber mentions as the first example a piece on the *Loves of Mars and Venus*. Geneste gives the year 1723 as the commencement of pantomime in England, with *Harlequin Dr Faustus* by John Thurmond, presented at Drury Lane. John Rich (1681-1781) produced splendid pantomimes at Lincoln's Inn Fields and Covent Garden, and from that time this form of entertainment became a traditional institution.

In the older English pantomimes the harlequin played a serious as well as merely comic part; columbine (originally his daughter) was a village maiden whose lover was pursued by the constables—the prototypes of the modern policemen. The predominance of the clown seems to be a modern

development, mainly due to the exceptional ability of Joseph Grimaldi. Now the chief reliance of the manager is on scenic and spectacular effects, large sums of money being lavished on the *mise en scène*.

Pa'oli, PASQUALE DE, a famous Corsican patriot, was born in 1726 at Morosaglia in Corsica, son of that Giacinto Paoli who fought bravely, but without success, for independence against the Genoese and their French allies, and died at Naples in 1756. Thither he was carried in 1739 by his father, but returned to take part in the heroic struggle of his country, and in July 1755 was appointed to the chief command in a full assembly of the people. He struggled bravely against disaffection within and a powerful enemy without, governed the island with rare wisdom and moderation, and would have achieved the independence of Corsica had not the Genoese sold it in 1768 to France. For a year he held out against a French army, under the Comte de Vaux, of 22,000 men, but was at length overpowered and forced to make his escape to England, where he was warmly received and granted a pension by the crown. Boswell, who had visited him in Corsica, introduced him to Dr Johnson, who described him as having 'the loftiest port of any man he had ever seen.' The two became warm friends; at Paoli's house Johnson wrote to Mrs Thrale he loved to dine. Twenty years later the French Revolution recalled Paoli to Corsica, of which, as a free department of France, he consented to become lieutenant-general and governor; but the excesses of the Convention soon alienated his sympathies, and he organised a fresh insurrection. Despairing of maintaining unaided the independence of the island, he promoted its union with England, but failed to obtain the post of viceroy, and returned a disappointed man to England in 1796. He died near London, 5th February 1807; and in 1889 his remains were exhumed from Old St Pancras Churchyard, and reinterred in his native island.

See Boswell's *Account of Corsica* (1768), and the *Lives of Paoli* by Arrighi (Paris, 1843), Klose (Brunswick, 1853), Bartoli (Ajaccio, 1867), and Oria (Genoa, 1869).

Papa (Lat., 'father'), the Latin form of the title now, in the Western Church, given exclusively to the Bishop of Rome (see POPE). Originally, however, meaning simply 'father,' it was given indiscriminately to all bishops. In the Greek Church, whether in Greece Proper or in Russia, *papa* is the common appellation of the clergy.

Papacy. See POPE.

Papain is a nitrogenous body, isolated from the juice of the tropical Papaw (q.v.). The juice from which it is extracted is a milky, white, inodorous fluid, obtained by making incisions in the ripe fruit. From this papain is isolated by precipitation with alcohol after the fatty matters present have been removed. The juice has been for a long time used in the West Indies for making meat tender; but it has only recently been shown that papain possesses, like pepsin and trypsin, the power of digesting meat-fibre; and this digestion will go on in an alkaline, a neutral, or an acid solution. Hence it belongs to the group of digestive ferments, and like them is employed in some cases of dyspepsia, being either administered internally or employed for the pre-digestion of food. It has also been used for the removal of warts and for the solution of the 'false membrane' in cases of diphtheria.

Papal States. See CHURCH (STATES OF THE).

Papaveraceæ, a natural order of exogenous plants, herbaceous or half shrubby, usually with a milky or coloured juice. The leaves are alternate,

without stipules; the flowers on long, one-flowered stalks. The fruit is pod-shaped or capsular, the seeds numerous (see POPPY). The order is distinguished for narcotic properties. Opium (q.v.) is its most important product. The juice of Celandine (q.v.) is very acrid. The Blood-root or Sanguinaria (q.v.) is another representative of the order. A number of species are used in their native countries for medicinal purposes. The seeds yield fixed oil, which, with the exception of that obtained from *Argemone Mexicana*, is quite bland. The flowers of many species are large and showy, most frequently white or yellow, sometimes red. There are in all about 130 known species, natives of all quarters of the world, and of tropical and temperate climates, but they abound most of all in Europe.

Papaw (*Carica papaya*), a small South American tree of the natural order Passifloraceæ (formerly made the type of a small family, Papayaceæ), which has now been introduced into many tropical and subtropical countries. The fruit is eaten either raw or boiled. The seeds when chewed have in a high degree the pungency of cresses. The powdered seeds and the juice of the unripe fruit are most powerful anthelmintics. The juice of the fruit and the sap of the tree render tough meat tender (see PAPAÏN); even the exhalations from the tree have this property, and joints of meat, fowls, &c. are hung among its branches to prepare them for the table. It bears fruit all the year, and is exceedingly prolific. The *Chamburu* (*C. digitata*), another species of the same genus, a native of Brazil, is remarkable for the extremely acrid and poisonous character of its juice, and the disgusting stercoraceous odour of its flowers.—In the United States the name Papaw is given to the *Asimina triloba*, a small tree of the natural order Anonaceæ, the fruit of which, a large oval berry, 3 inches long, with soft, insipid pulp, is eaten by negroes, but not generally relished by others. All parts of the plant have a rank smell.

Papenburg, a small port in the north-west of the province of Hanover, 25 miles W. of Oldenburg by rail and near the Ems, with which it is connected by canals. Pop. 6916. In the neighbourhood are extensive moors.

Paper. The earliest paper was doubtless that made from Egyptian Papyrus (q.v.), whence all similar writing material is named. The papyrus paper used to be described as being made of the thin pellicles lying between the rind and the pith: now it is known to have been made of slices of the cellular pith laid lengthwise side by side, whereon other layers were laid crosswise, the whole moistened with Nile water, pressed and dried, and smoothed by being rubbed with ivory or a smooth shell. The papyrus paper was superseded in Europe by paper of other fibrous matter gradually between the 10th and 11th centuries (see PALÆOGRAPHY). At a remote antiquity the Chinese made paper of the bast of a special mulberry-tree, of sprouts of bamboo, and of Chinese grass (see BÈHMERIA). According to Fang Mi-Chih, author of the *Encyclopædia Tung-ya*, the Chinese at first wrote on bamboo-boards; but for 300 years before and after Christ the usual writing material was paper made of silk-waste, solidified in some way not described. The inventor of paper made of vegetable fibre was the statesman Ts'ai Lun, born in Kwei-yang, in the province of Hu-nan, who in 89 A.D. was in charge of the imperial arsenals. In 105 A.D. it is expressly testified that he had succeeded in making paper of bark, of hemp, of rags, and of old fishing-nets. The governor of Samarkand, returning from a victorious expedition into China in 751 A.D., brought back amongst his prisoners of war artisans who enabled him to estab-

lish a paper manufactory at Samarkand. Here Persians learned the mystery, and soon were making paper of old linen cloths. The demand rapidly increased, and new paper-works were at work in 795 at Bagdad, where the manufacture was carried on till the 15th century. Soon paper-making was practised in Damascus, Egypt, and along the north coast of Africa; and ere long this paper, to which the names of *papyrus* and *charta* were transferred, was imported into Europe, where it was generally known as *Charta Damascena*, *bombycina*, *cuttunea*, and *gossypina*. From the latter adjectives it has currently been held that the earliest paper was made of the pulp of crude cotton-wool, and that this was only gradually superseded by rag pulp. But the researches of Wiesner and Karabacek on 12,500 MSS. brought to Vienna from the Fayûm in 1884 by Archduke Rainer have proved that this is an error. There never was any paper made by Arabs from cotton-wool; the *charta cuttunea* was all made of rags, and called 'cottony,' probably only from its resemblance to fine cotton cloth. The first manufacture of rag paper in Europe was in Spain under the Moors; in 1154 there was a mill at Jativa. But soon after traces of paper-making are found in Italy, France, and Germany. In England there is said to have been a paper-mill at Stevenage in Hertford in 1460, but little is known of the history of paper-making in England till about 1558, when there was a well-known mill at Dartford. Rag paper had, however, been commonly in use since the 14th century.

The art of paper-making is one of the most useful that has been invented, and paper has acquired a degree of importance with which it would not have been credited in the 18th century. It has been well observed that paper has contributed more to the advancement of the human race than any other material employed in the arts, and its manufacture constitutes an industry depending more closely than any other on the march of civilisation. Its uses are now beyond number; the demand for it is so general that it has become an article of prime necessity, and one that is daily entering more and more largely into the ordinary wants and ordinary life of all classes. Large as the make of paper is in the United Kingdom, it is not applied to so many and general uses as paper and paper-pulp is in the United States, Japan, and some of the European countries. In the paper trade, as in other mechanical industries, there has been great progress made in the last half-century. Chemists and mechanics have each contributed their part. The former have furnished improved methods for washing, bleaching, and colouring the paper stock, which must yield a different product from what was made by the ancients; while the mechanical improvements also have been many, both for boiling, running out, drying, and finishing the pulp.

The vegetable substances from which paper can be made are innumerable, but the difficulties are to obtain them at a sufficiently low price to be used profitably and to secure a continuous supply. Many books and newspapers have been printed entirely of one material, such as bamboo, straw, jute, *Phormium tenax*, maize leaves, esparto, &c.: at the Paris Exhibition of 1889 a paper-maker showed more than sixty webs or rolls of paper, each made from a different vegetable fibre. Books, again, have been published which were composed of several hundred leaves, all of a different fibre. In Japan a species of mulberry osier is grown specially for its bark for paper-making. But the substances available in Europe are few that can be had in quantity at a low price.

The multitude of vegetable fibres that have been suggested for the use of the paper-maker is

bewildering, but of the number only two have come into use to any general extent; these are esparto and wood-pulp. The best sources of fibre for the paper-maker's use are linen and cotton rags for white paper, and hempen cordage for brown; but the modern uses of paper have become so numerous that rags are no longer available in sufficient quantities for paper-making. Having regard to the composition of paper, the supply would at first seem to be illimitable, inasmuch as woody fibre is amongst the most common of vegetable things. Practice, however, soon teaches the important lessons (1) that not all woody fibre is equally well adapted for the production of paper, and (2) that many vegetable growths are built up of admirable cellulose for the paper-maker's use, but yield it with such trouble and at such cost as to be wholly unremunerative. Much caustic soda or soda-ash is required in the preparation of many fibres.

Raw fibre may be divided into four classes: (1) that which is easily reduced and easily bleached; (2) that which is difficult to bleach; (3) that which is difficult to reduce, but easily bleached; and (4) that wherein perfect bleaching affects the integrity of the fibre. The longer the fibres and the more intricate the mixture of them when wet, the stronger will be the sheet of paper when dry. The shorter the fibres, the less pliable will they become with water, as in the case of ground wood, and the less will be the pressure which individual fibres exert on each other, and the more brittle will the paper sheet turn out.

Various early attempts to employ Esparto (q.v.) for paper-making are recorded. One patent dates back to 1839, and paper made of it was shown at the London Exhibition in 1851. But to the late Mr T. Routledge is mainly due its extensive employment by the trade. He commenced with a few tons at the Eynsham Mills in 1856, and the paper for the number of the Society of Arts weekly journal for November 28 of that year was made of it. For several years the makers looked very coldly on this new material, but gradually by the aid of Mr Pirie, Mr E. Lloyd, and others it became universally adopted. From an import of 891 tons in 1861 it has gradually increased as follows: in 1870, 89,156 tons; 1880, 191,229 tons; and 1890, 217,048 tons. The United Kingdom has hitherto monopolised the supply. Esparto is treated much like straw, but does not require as much soda-ash and chlorine to bleach it. The fibres are easily dissolved and bleached by chemicals. They felt readily and yield an excellent pulp, which is employed alone, or mixed with rags, wood-pulp, or straw. It furnishes a paper pliant, resistant, transparent, and of great purity, thicker than other papers of the same weight, and forming a good printing and writing substance.

The culms of various cereal grasses are employed where obtainable; rice-straw in Asia, wheat, oat, and other kinds of straw in Europe. Straw was used a century ago for paper-making, but its extensive use is of comparatively recent date. For low papers it commands a market, but as a mixer it is inferior to esparto, the internodes or knots being exceedingly troublesome and difficult to get rid of. The deficiency in the supply of rags and the absence of any cheap substance to supplement esparto have led to a great run upon wood-pulp in the last few years for the paper-mills in Great Britain and most other countries. Its manufacture and use dates practically back only to about 1870; indeed its general adoption may be referred to the ten years later. Although not all that could be wished for as an adjunct or filler, its introduction and employment have proved eminently useful. The conifers giving the strongest and toughest fibre seem to be best adapted for conversion into pulp,

although many other species are used. The production has centred chiefly in the two Scandinavian countries of Norway and Sweden. From these Britain yearly receives about 140,000 tons of wood-pulp, besides what they ship to other countries. They also make a large quantity of paper and pasteboard for export. The quantity and value of the paper materials received by Britain in 1889 were:

	Tons.	42,443 value	£226,323
Rags.....	217,256	"	1,090,266
Esparto, &c.....	132,179	"	690,692
Wood-pulp.....			
Total.....	381,878		£2,207,280

The idea of making a paper-pulp of wood was repeatedly mooted in the early part of the 19th century. A patent was granted to some paper-makers in Italy in 1828. Some years later the idea was revived in improvements in Great Britain by Desgrand, Johnson, Newton, and others. Mr Houghton took out a patent in 1857. But the mechanical process of Volter of Heidenheim was that which gave the principal impetus to the use of wood-pulp. At first the wood was simply rubbed down into pulp against the periphery of a wheel with a rough surface; but now by improved chemical appliances a better pulp is produced, and the manufacture has become generally adopted in Europe and America, adding largely to the value of their forests. Wood-pulp is admirably adapted as a principal ingredient in the manufacture of cheap paper. It is deficient in fibre, but a moderate admixture of rags, esparto, or other fibrous material strengthens it. It was about 1873 that wood-pulp began to be introduced in England as a paper material. At first only 12,000 tons could be got rid of yearly, but in 1890 as much as 137,837 tons was received, chiefly from Sweden and Norway. Much of the paper made is used up a second time. Koop's patent for reworking old waste-paper was carried on in the earlier years of the 19th century at the Neckinger Mills, Bermondsey. The process of manufacture then would seem to have been faulty, the paper made being found unfit for use, and the mill was sold. The process has, however, been brought extensively into use of late years, old newspapers and books forming much of the material for repulping. Cotton and linen rags are one of the mainstays of the paper-maker, and all countries are drawing largely on this waste substance. In Great Britain, unlike sunny climes, woollen clothing is more generally worn than cotton and linen, hence these used vegetable fibres are not so plentiful with us as in Asia and the states of southern Europe. British imports of foreign rags have been largely on the increase: they were 29,642 tons, valued at £451,762, in 1880, and 34,889 tons, valued at £354,306, in 1890; but these are principally reshipped. In 1889, 58,860 tons of British rags and materials for paper were exported, valued at £473,254, and 39,122 tons of foreign rags of the value of £345,212.

The prices of all paper-making materials have fallen greatly since 1875. Rags have dropped from £17, 6s. in 1875 to £11, 6s. per ton; esparto and other materials from £8 to £5, 9s. per ton. Even with this reduction in price, a great impetus has been given to the use of straw and wood-pulp. The demand for paper continues great. Some of the London daily journals consume 100 tons weekly; but as they sell at low prices the paper they use must be cheap. In order to reduce the price many makers introduce into their pulp sawdust and various mineral matters, such as kaolin or china clay. Very often 25 to 30 per cent. of such substances is introduced into these loaded papers, which do for cheap journals, the sheets of which have hence no solidity. But if such papers

are used for book-work they have no durability, and are also injurious to the type. Another cause which contributes quite as much to the bad quality of many modern papers is the too rapid desiccation which the sheets undergo in the preparation of machine-sized paper. Admitting that many of the papers now made are infinitely finer, more beautiful, and above all whiter than those made in former times, it is equally true that in general machine-made papers possess less strength than the old hand-made papers. Paper of pure and good quality ought not to leave after burning more than 2 per cent. of ash.

The question for consideration as to the future is whether raw material enough can be obtained in quantity to keep our mills going, since esparto must gradually fail, and wood-pulp and rags will alone remain to us, unless some new, cheap, and abundant vegetable fibre can be met with. About 90,000 tons of rags are collected in Britain, but they are chiefly of cotton fabrics, and even these are now much drawn upon for other purposes. How much longer will Belgium, France, and Germany be disposed to part with their rags? and without rags wood-pulp is useless, however plentiful it may be.

The varieties of paper made are chiefly the following four classes: (1) news and printing papers; (2) writing-papers of various kinds, blue, cream, and yellow laid, and wove and tinted, and for account-books, &c.; (3) wrapping or packing papers, brown and purple, heavy manilla for cartridge and bags; (4) miscellaneous, such as light copying, tissue, and pottery papers, blotting and filtering, cigarette, &c. Lastly, there are all kinds of cardboards and millboards made. The following enumeration shows the principal kinds of papers, &c. made in the British mills; but the list might be extended to one or two thousand names of various kinds and qualities. Account-book, backing, bag-papers, bank-note and bill, blottings, boards, bowl-papers, browns (heavy and cutting), butter, caps (brown for bags), cards for looms, carpet-felt, cartridge, casings, chart-papers, cheques, cigarette, collar, coloured, copyings, drawings, drying royals, duplex, enamelled, engine-boards (glazed and milled, paste and portmanteau), envelope-paper, filtering, fly-papers, foil or tin-foil, grocery, gun-wadding, hosiery, lithographic, loans, long elephants, manifold, manillas, marbled, middles (browns), mill wrappers, music, news or printings, parchment, pin and needle, plate, railway-ticket, royal hands (gray, brown, blue, and white), sampling, skips, small hands (browns), tea-paper, tissues, tobacco, tracings, tube-paper, waterproof, wrapping, writing. It is on record that in 1772 there were sixty varieties of paper made from as many different materials, and ten or twelve years later the number had been extended to 103. In those days all paper was manufactured by hand, each sheet separately. The rags were pulped in mortars by trip-hammers, and several days were required to turn out a sample of dry finished paper. The workman dipped a rectangular sieve or mould into the vat and deposited the sheet of fluid pulp on a piece of felt to dry.

This simple mode of manufacture, which is still largely practised in Holland and Italy, has been superseded very generally by continuous machines, and only a small quantity of paper for special books, *éditions-de-luxe*, and the like, besides a superior writing, bank-note, and drawing paper is now made by hand in England. Millboards (q.v.) and pasteboard or cardboard were formerly chiefly made for bookbinding; but now they are much in demand for box-making, machine, packing, and other purposes. Over 50,000 tons of straw and wood board are imported from Germany, Holland, Belgium, and other countries, besides what is made in Britain.

The various machines for making paper in continuous lengths are wonderful productions of mechanical skill, being almost automatic in their action, and they work with marvellous exactness. These machines consist of contrivances for causing an equal supply of pulp to flow upon an endless wire-gauze apron, which revolves and carries on the paper until it is received on an endless sheet of felt, passing around and between large couching-cylinders. These machines have now been brought to such perfection that paper can be made in one continuous roll or web of any length, and before leaving the machine is sized, dried, calendered, hot-pressed, and cut into sheets.

At the Edinburgh Exhibition in 1886 a web of paper was shown five miles long, and at the Pittsburgh Exhibition there was a roll 14 miles long, 18 inches wide, which weighed 2658 lb. Some of the machines are 75 to 100 feet long and 126 inches wide, requiring a building to themselves, and making a sheet of paper 7 feet in width.

Fig. 1 is a side-view of a continuous paper-making machine, and fig. 2 a vertical one. The principle of the machine is very simple: it contains a pulp-vat, A, with a hog or wheel inside to agitate the pulp, and an arrangement for pouring the pulp over the wire-gauze mould, B, B, B, B, which, instead of being in single squares, as in the hand-process, is an endless sheet moving round two rollers, *a*, *b*, which keep it stretched out and revolving when in operation. Under the part which receives the pulp there is a series of small brass rollers, *d* (fig. 1); these, being nearly close together, keep it perfectly level—a most necessary condition; besides which there is a shallow trough, *ee* (fig. 1), called the *save all*, which catches and retains the water that always escapes with some pulp in suspension; and an arrangement of suction boxes and tubes, *f*, *f*, *f* (fig. 1), worked by air-pumps, which draw much of the water out as the pulp passes over them. The pulp is kept from running over the sides by straps called *deckles*, which are also endless bands, usually of vulcanised india-rubber, carried round moving rollers so that they travel with the wire-gauze, and therefore offer no resistance to it. In addition to all this the framework on which the surface of the wire-gauze rests has a shogging motion, or side-shake, which has an important effect in working the fibres together before the pulp finally settles down. When it reaches the *couching-rolls*, which press out most of the remaining moisture, and carry it forward to the first and second series of press-rolls by means of an endless web of felt which passes round them, the speed of these rollers and the travelling sheet of felt, CC (figs 1 and 2), is nicely calculated, so as to prevent a strain upon the still very tender web of paper. Sometimes the upper rollers of these two series are filled with steam in order to commence drying the web. The paper is now trusted to itself, and passes on, as indicated by the arrows, from the second press-rolls to the first set of *drying cylinders*, DD (figs. 1 and 2), where it again meets with a felt sheet, which keeps it in close contact with the drying cylinders, which are of large size, and filled with steam. Around these it passes, drying as it goes, and is then received between the two *smoothing-rolls*, or damp calenders, which press both surfaces, and remove the marks of the wire and felt, which are until then visible on the paper. This necessarily is done before the drying is quite completed; and from the smoothing-rolls it passes to the second series of drying cylinders, E (figs. 1 and 2), where the drying is finished, and thence to the calenders, which are polished rollers of hard cast-iron, so adjusted as to give a considerable pressure to the paper, and

produce a glossiness of surface. For writing-papers the paper passes through a shallow trough of size after leaving the drying cylinders, and then passes over another series of skeleton cylinders, with fans moving inside, by which it is again dried without heat, and afterwards passes through the calenders. Printing and other papers are usually sized by mixing the size in the pulp, in which stage the colouring materials—such as ultramarine for the blue tint of foolscap—are also introduced. Still following the paper web in the drawing (fig. 1), it is seen to pass from the calenders to another machine, F; this slits the web into widths, which are again cross-cut into sheets, the size of which is regulated at will. In the United States, for fine book-work, the paper receives a white coating after it has been made; it is the finish thus given to the surface that renders the illustrations seen in the best American magazines possible. The water-mark is impressed on machine-made paper by means of a fine light-wire cylinder with a wire-woven pattern; this is placed over the wiregauze sheet upon which the pulp is spread, but near the other end of it, so that the light impression of the marker may act upon the paper just when it ceases to be pulp, and this remains all through its course. There are many other interesting points about the paper-machine, but their introduction here would rather tend to confuse the reader. Its productive power is very great; it moves at a rate of from 20 to 200 feet per minute, spreading pulp, couching, drying, and calendering as it goes, so that the stream of pulp flowing in at one end is in two minutes passing out finished paper at the

Fig. 1.

Fig. 2.

other. It has been computed that an ordinary machine, making webs of paper 54 inches wide, will turn out four miles a day.

Paper Production of the World.—The following is a tolerably accurate return of the paper-mills of Europe in 1890, and their annual production:

	Mills.	Tons.
United Kingdom.....	800	400,000
France.....	491	240,000
Germany.....	1083	180,000
Austro-Hungary.....	741	73,000
Italy.....	230	48,000
Spain.....	95	13,000
Sweden and Norway.....	131	14,000
Netherlands.....	65	7,200
Russia.....	46	33,500
Belgium.....	37	32,500
Switzerland.....	34	10,000
Portugal.....	16	6,000
Denmark.....	13	3,600
Roumania and Greece.....	4
Total.....	3296	1,049,800

Many of the mills may not be working, some produce pulp only, and the vat-made paper is included in the estimate of production. Assuming 1 million tons are made annually, this may be valued at £30,000,000, of which half is the prime cost of the raw material.

It is difficult to determine with any precision the quantity of paper now made in the United Kingdom, as the manufacture is free from tax; but we may form a fair estimate by looking at the progress under the duty rate, and judging of the advance since from the increased exports and the stimulus now given to production. The following are official figures of the quantity of paper charged with duty before the abolition of the tax, which brought in £1,500,000. In 1842, 43,166 tons; 1852, 100,000 tons; 1861, 102,456 tons. In 1851 Mr Poole, in his *Statistics of British Commerce*, stated that there were then 437 paper-mills at work in the United Kingdom; 349 in England, 48 in Scotland, and 40 in Ireland. The weight of paper made amounted to 62,000 tons; the estimated value of which was £3,000,000. The number of mills in 1860 was 397; in 1870, 369. Mr W. Arnot, in his course of lectures on the 'Technology of the Paper Trade' before the Society of Arts in 1877, stated the number of paper-mills working in the United Kingdom at 385; of which 300 were in England, 65 in Scotland, and 20 in Ireland. The number of machines employed he gave at about 526, producing 350,000 tons of paper, which, with 10,000 tons of hand-made, gave a total production of 360,000 tons. This quantity he estimated to be worth £16,000,000 sterling. This is, however, far too high an estimate, having regard to the depreciated prices resulting from the fall in value since 1860. The 400,000 tons made at the present time cannot be valued at more than £12,000,000. Assuming the annual production of paper in the United Kingdom at present to be 400,000 tons, the home consumption is evidently large and progressive, for we only export in books and paper about 57,000 tons, while we import of writing and printing papers 15,000 tons. Newspapers, books, and periodical literature use up fully one-half of our total make. Schools and public offices and correspondence consume much of the remainder, leaving but little for wrapping, packing, and other purposes. Judging from the data adduced, the British paper-manufacture has more than quadrupled since the abolition of the paper-duty.

The export trade of the United Kingdom in paper has been rapidly progressive, as the figures in the following table will show; the first of its two columns comprising writing-paper, printing-paper, and envelopes; and the second all other kinds of paper.

	Cwt.	Cwt.
1870.....	130,660	38,465
1880.....	336,118	124,450
1889.....	712,246	216,590

The average price of paper, which in 1874 was as high as £3, 2s. per cwt., has fallen as low as 30s. per cwt. The superiority of the British over the continental manufacture has obtained for Britain a steadily increasing business in the markets of Asia, South America, and her Colonies. In 1879 the value of the British paper of all kinds exported was £915,925; in 1889 it was £1,602,075, even at the much lower prices ruling. In 1889 was imported of paper and pasteboard of all kinds 2,110,000 cwt., an increase of 1 million cwt. over 1882.

In the United States equal progress has been made in the paper-manufacture as in Great Britain. The first mill was established in 1690, on ground now included within Philadelphia. In 1770 there were forty paper-mills in Pennsylvania, New Jersey, and Delaware, and only three or four in New England. In 1840 there were in the United States but 426 paper-mills; in 1850, 443; and in 1860, 500, producing 60,000 tons; in 1872 there were 812 mills, owned by 705 firms, making 200,000 tons. At present, with over 1000 paper-mills having 3000 machines, the quantity made greatly exceeds that of the United Kingdom; the amount in some of the last years of the decade 1880-90 amounting to over 1,200,000 tons. In the other parts of America there are 85 paper-mills. In Asia there are 19 paper-mills, besides numerous vats; in Africa, 4; and in Australasia, 7; making a total of nearly 4500 mills in the world. The production of hand-made papers in China and Japan it is impossible to estimate. China has made great strides in her exports of paper of all kinds. From about 75,000 cwt. a few years ago the export advanced to 200,000 cwt. in 1887, valued at £304,000. The greater part of the paper now made in the world—at least three-fourths—is believed to be used for printing on, since the correspondence carried on in many countries out of Europe is comparatively small.

There are works on paper and paper-making by Hoffmann (New York, 1873), Munsell (New York, 1876), Archer (1876), Dunbar (1881), Parkinson (1886), C. T. Davis (1886), and Cross and Bevan (1887). For old water-marks dating from 1473, see *Archæologia*, vol. xii. For ancient paper-making, see Hirth, *Chinesische Studien* (1890), and Karabosok, *Das Arabische Papier*. WALL-PAPER is the subject of a separate article.

Paphlagonia, anciently a province of Asia Minor, extending along the southern shores of the Black Sea, from the Halys on the east to the Parthenius on the west (which separates it from Bithynia), and inland on the south to Galatia. Its limits, however, were somewhat different at different times, and it successively belonged to Lydia, Persia, and Rome. Its capital was Sinope. The Paphlagonians are supposed to have been of Syrian or Semitic origin, like the Cappadocians.

Paphos, two ancient cities in Cyprus. Old Paphos (now *Kykia*) was situated in the western part of the island, about 1½ mile from the coast. It probably was founded by the Phœnicians, and was famous, even before Homer's time, for a temple of Venus, who was said to have here risen from the sea close by, whence her epithet *Aphrodite*, 'foam-sprung.' This was the home of the 'Paphian Venus,' and hither crowds of pilgrims used to come. The other Paphos (*Papho* or *Baffa*) was on the seacoast, about 8 miles west of the older city, and was the place in which the apostle Paul proclaimed the gospel before the proconsul Sergius.

Papias, Bishop at Hierapolis, in Phrygia, in the earlier half of the 2d century, is known to us only from references by Irenæus, Eusebius, and a

few others, and from fragments of his lost work preserved in their writings (see especially Eusebius, *Historia Eccl.* iii. 39). Irenæus speaks of him as a 'hearer of John'—evidently meaning the apostle. Eusebius aptly quotes Papias himself against Irenæus on the point; but, while the quotation justifies his criticism thus far, it does not fully bear out his own view that Papias claimed to have been a hearer of two other disciples of the Lord, Aristion and the elder (not the apostle) John. There is, then, no very reliable evidence of personal intercourse with any of the immediate followers of Jesus. On the other hand, some of the links between Papias and the apostles are definitely known; for two daughters of the apostle Philip, living in Hierapolis, related traditions to him, and he was a 'companion of Polycarp' (69-155 A.D.), Bishop at Smyrna, who in his youth had been a disciple of the apostle John. The statement, however, in the *Chronicon Paschale*, that Papias suffered at Pergamum in the year of this contemporary's martyrdom at Smyrna, rests on the compiler's misreading of Eusebius (*Hist. Eccl.* iv. 15).

The only work which he is known to have written is the *Logiōn kyriakōn ezeḡēsis* ('Exposition of Oracles of the Lord'), in five books, which on various grounds, including an expression in a fragment recently discovered, may be probably assigned to the period 140-150. It is now generally agreed that the signification of 'oracles' is not to be absolutely limited to 'discourses,' and that by 'Oracles of the Lord' we are to understand a record, or records, of the Lord's sayings, including at least a setting of narrative. Part of the author's design was to supplement his expositions with trustworthy oral traditions. But the scanty remains are enough to show that Papias was, as Eusebius says, 'of very small intellect,' credulous, and fond of recording the wonderful. His doctrinal characteristic is a quaint millenarianism, with traces of the *Apocalypse of Baruch*.

But it is in relation to the New Testament canon, and especially to what is known as the synoptic problem, that Papias is of real importance. The fragment bearing on Mark runs thus: 'This also the elder (John) said: "Mark, having become the interpreter (recorder) of Peter, wrote down accurately whatever he remembered, without, however, recording in order what was either said or done by Christ,"' &c. Many scholars maintain that the words suit the second gospel as we have it, while others who deny this accept them as an account of its groundwork. Still greater interest attaches to the short fragment on Matthew: 'Matthew, then, composed the oracles in the Hebrew (Aramaic) language, and each one interpreted them as he could.' This statement has often been called in question, but the best authorities now hold that Papias is correct as to the Aramaic original, and that the canonical gospel, while evidently not a translation, is a Greek edition, by either Matthew himself or some writer unknown. On the whole, the two-document hypothesis of the origin of the synoptics, which at present holds the field, coincides remarkably with the above two fragments (see GOSPELS). As to the rest of the canon, Papias quoted 1 John and 1 Peter, and was cited as an authority for the 'credibility' of the Apocalypse. There are also some indications that he knew the fourth gospel.

For Papias generally, see Lightfoot, *Essays on the Work entitled 'Supernatural Religion'* (1889); for the collected fragments, the *Patrum Apost. Opera* of Gebhardt, Harnack, and Zahn; for an English translation, the *Ante-Nicene Library*, vol. i.

Papier-mâché (Fr., 'mashed or pulp paper'). This name is applied to a material consisting either of paper-pulp or of sheets of paper pasted together,

which by a peculiar treatment resembles varnished or lacquered wood in one class of articles made of it, and in another class (chiefly architectural ornaments) somewhat resembles plaster. Other substances are, however, mixed with paper, especially for the latter class of objects. Among eastern nations, where varnished and decorated articles in papier-mâché have long been made, the finest work has been produced in Persia, and next to it in Cashmere. The articles chiefly made are cases for pens and other writing materials, as well as boxes and trays. In Japan various objects are manufactured by glueing together a number of sheets of the soft and flexible paper of that country upon moulds, when it is in a damp state. This kind of papier-mâché, which is light, strong, and elastic, was at one time used in that country for helmets and other parts of armour. No doubt it was from one or other of these eastern countries that the art of working in papier-mâché was acquired by Europeans.

Articles of papier-mâché were extensively made in France in the first half of the 18th century. Subsequently the manufacture was largely developed in Germany. The painted papier-mâché snuff-boxes and other articles termed Vernis Martin work, from the fact that they were made by a coach-painter named Martin, who had a peculiar way of varnishing them, were in the 18th century popular throughout Europe, and fine specimens are still sought after by collectors. Papier-mâché appears to have been introduced into England for the purpose of imitating Japanese trays of lacquered wood. In 1772 Henry Clay of Birmingham took out a patent for making papier-mâché of sheets of specially prepared paper pasted together upon a mould. In this way he produced panels for doors and walls, besides cabinets, screens, tables, tea-trays, &c., and these are still manufactured. The best papier-mâché is made by Clay's method; but it is also made from paper-pulp to which glue has been added, and this is pressed between dies to give it the required shape. There is a third kind made of coarse fibrous material, mixed with earthy matters and a binding size, certain chemicals being added to render it incombustible. Suppose that a tray-blank of pasted sheets has been formed upon a metal mould. It is then heated to 120° F., and afterwards dipped in a mixture of linseed-oil and spirits of tar (other mixtures are used) to harden it and make it resist moisture. It is again placed in a stove, and when taken out it is planed and filed to give it the required finish. The tray now gets several coats of tar varnish and lampblack, each of which is rubbed down with pumice, and stoved once more. It is then ready to be decorated, after which it receives a coat of transparent varnish, and is finally polished with the hand.

Carton-pierre, which has been extensively employed for the internal decoration of buildings (much in the same way as plaster), is formed of paper-pulp mixed with whiting and glue, and pressed into plaster moulds. It is next backed with paper, allowed to set, and dried in a hot room. *Ceramic Papier-mâché* (Martin's patent dated March 15, 1858) is a very plastic substance, which can be readily moulded or otherwise worked into any required form. It is composed of paper-pulp, resin, glue, drying oil, and sugar of lead, well kneaded together.

There are various ways of decorating papier-mâché. For tea-trays, caskets, panels, and other objects with a black varnished surface, what is called 'inlaying' with plates of mother-of-pearl shell, scarcely thicker than stout writing-paper, has been largely practised. The pieces of shell are stuck on with varnish, and the design painted on them with a protecting varnish. An application

of acid dissolves away the unprotected parts, and then the interspaces are filled up with varnish. When the surface is rubbed with pumice-stone the superfluous varnish is removed, and the shell ornaments displayed. In a similar way the surface can be 'inlaid' with cut-out metal devices. Flower and landscape painting has also been much employed in the way of decoration, as well as borders and other ornaments in leaf gold. Owing to the extensive importation in recent years of cheap Japanese lacquer wares (see LACQUER), the Birmingham manufacturers of papier-mâché have now largely resorted to an inexpensive decoration by transfer-printing, which can be done by boys and girls instead of highly-paid artists. A change has also taken place in the nature of the material itself, which has recently been chiefly made of wood-pulp from Sweden. A limited quantity of the old high-class papier-mâché is, however, still regularly manufactured. The variety of papier-mâché adopted for architectural ornaments, which are usually more or less in relief, can be readily painted, gilded, or bronzed. The application of papier-mâché to articles requiring great strength, such as wheels for railway carriages, has not proved so successful as was at one time anticipated.

Papilionaceæ (from Lat. *papilio*, 'butter-fly'), a sub-order of the natural order of plants generally called Leguminosæ (q.v.), the plants of which have flowers of the peculiar structure called *papilionaceous*, and of which the Pea and Bean afford familiar examples. Papilionaceous flowers have five petals, imbricated in estivation (bud), one of which, called the *vexillum*, or *standard*, is superior, turned next to the axis, and in estivation folded over the rest; two, called the *alæ*, or *wings*, are lateral; and two are inferior, which are often united by their lower margins, forming the *carina*, or *keel*. The number of the Papilionaceæ is very great—about 4800 species being known. They are found in all parts of the world, abounding in the tropics. Many have superb and beautiful flowers; many are plants of beautiful form and foliage, trees, shrubs, or herbaceous plants; many possess valuable medicinal properties; and many are of great importance as furnishing food for man and for domestic animals, others as furnishing dyes, fibre, timber, &c. See BROOM, LABURNUM, CLOVER, BEAN, PEA, LUCERNE, LIQUORICE, INDIGO, SANDALWOOD, &c.

Papillæ. See SKIN, TASTE.

Papin, DENIS, a French physicist, was born at Blois, 22d August 1647, and studied medicine in Angers, where he practised for some time as a physician. But, becoming acquainted with Huygens, he helped him in his experiments with the air-pump; then, crossing to England, he assisted Boyle in his physical experiments, invented the condensing pump and the steam digester (1681)—a sort of steam cooking apparatus, to which was applied for the first time a safety-valve—and was made a member of the Royal Society (1680). Shortly afterwards he proceeded to Venice for the purpose of helping to conduct a newly-founded academy of science, but was back in London in 1684. Three years later he was appointed professor of Mathematics at Marburg, but from 1696 to 1707 worked in Cassel. Then, returning to England, he died in obscurity, probably in 1712. To Papin belongs the honour of having first applied steam (1690) to produce motion by raising a piston, and with this he combined the simplest means of producing a vacuum beneath the raised piston—viz. by condensation of aqueous vapour. In virtue of this his biographer claims that he is really the inventor of the steam-engine. He is the inventor of the safety-valve, an essential part of his digester;

and he discovered the principle of action of the siphon.

His papers were mostly printed in the *Philosophical Transactions*, *Acta Eruditorum*, *Journal des Savans*, &c. He also wrote *Nouvelles Expériences du Vuide* (Paris, 1674). See Lives by Ernouf (Paris, 1874) and Gerland (Berlin, 1881). His correspondence with Huygens and Leibnitz was published by Gerland (Berlin, 1881). See *Nature*, vol. xxiv. (1881).

Papineau, LOUIS JOSEPH, Canadian statesman, was born at Montreal in October 1789. At twenty he was elected to the Legislative Assembly, and speedily worked his way to the head of the Radical or French-Canadian party, and in 1815 was chosen speaker of the House of Assembly for Lower Canada, a post that he held until 1837. He opposed the union of Upper and Lower Canada, formulated the grievances and demands of his party in the Ninety-two Resolutions, and agitated actively against the imperial government. When the province rose in rebellion in 1837, a warrant was issued against Papineau for high-treason, though he took no active part in the fighting. He escaped to Paris; but returned to Canada, pardoned, in 1847. He died at Montebello, in Quebec, on 23d September 1871.

Papinianus, ÆMILIUS, down to the time of Justinian the most celebrated of the Roman jurists, lived at Rome during the reign of Septimius Severus, whose second wife is said to have been his relative. Both he and Septimius were pupils of Scævola; Papinianus succeeded the prince as *advocatus fisci*, and afterwards held the office of *præfectus prætorio*. The son and successor of Severus, Caracalla, caused Papinianus to be put to death in 212. His works consist of 37 books of *Questiones*, 19 of *Responsa*, 2 of *Definitiones*, and *De Adulteris*; from these works 595 excerpts were incorporated in Justinian's *Pandects*.

Pappenheim, GOTTFRIED HEINRICH, COUNT VON, an imperial general of great note in the Thirty Years' War, was born at Pappenheim, in Middle Franconia, Bavaria, 29th May 1594, of a very ancient Swabian family, in which the dignity of Marshal of the Empire became hereditary about the 13th or 14th century, and many of whose members had greatly distinguished themselves in the wars of the middle ages. At twenty he went over to the Roman Catholic Church, and thenceforth signalised himself by his fiery zeal in its cause. After serving under the king of Poland in his wars with the Russians and Turks Pappenheim joined the army of the Catholic League, and in the battle of Prague (1620) stayed the flight of the Austrian cavalry, and by a well-timed and furious charge turned the tide of battle against the Bohemians. In 1623 he received from the emperor the command of a cavalry regiment of the famous 'Pappenheimer Dragoons.' In 1625 he became general of the Spanish horse in Lombardy; but in 1626 he re-entered the Austrian service, and after suppressing a dangerous revolt of the peasants of Upper Austria, in which 40,000 of the peasants perished, he joined the army which was opposed to the Protestant League, and, in association with Tilly, carried on many campaigns against the Danes, Swedes, and Saxons. It was Pappenheim who induced Tilly to attack Magdeburg (q.v.), and on his head rests in great measure the guilt of the ferocious massacre. His reckless bravery involved Tilly against his will in the disastrous battle of Breitenfeld; but to some extent he retrieved his character by his heroic efforts to remedy the loss and protect the retreat of the army. After Tilly's death he served under Wallenstein, who detached him with eight regiments to protect Cologne, but, on hearing of the advance of Gustavus, sent an urgent order for his

return. Pappenheim arrived at Lützen at the moment when Wallenstein's army was on the point of being completely routed, and at the head of his cuirassiers he charged the left wing of the Swedes with such fury as to throw it into confusion, and for a moment change the fortune of the battle. He was mortally wounded in the last charge, and died a few hours afterwards at Leipzig, November 7, 1632, with a smile on his countenance, after learning that Gustavus Adolphus was dead. 'God be praised!' he said: 'I can go in peace, now that that mortal enemy of the Catholic faith has had to die before me.'

Pappus. See COMPOSITÆ.

Pappus OF ALEXANDRIA flourished about the end of either the 3d or the 4th century A.D. Which of these dates is the more probable it is difficult to determine, owing to conflicting evidence, but recent opinion inclines to the former. Suidas states that Pappus was a contemporary of Theon, thus placing him towards the end of the 4th century, and ascribes several treatises to him. These treatises have not survived, and the only work by which Pappus is now known, his *Mathematical Collection*, receives no mention from Suidas. This work consisted of eight books, the first and the earlier part of the second of which are lost, and its interest is mainly, though not exclusively, historical. From what remains of the second book, it is conjectured that the first two books were arithmetical. The third book explains some of the methods for the duplication of the cube, treats of the progressions and the five regular polyhedra. The fourth book discusses the figure called the *arbelos* ('a shoemaker's knife'), the spiral of Archimedes, the conchoid of Nicomedes, and the quadratrix of Dinostratus. The fifth book contains some theorems regarding isoperimetrical figures plane and solid, and a short account of the semi-regular solids of Archimedes. The sixth book comments on some of the works of Theodosius, Aristarchus of Samos, and Euclid. From the seventh book, which is the longest and most valuable of the *Collection*, is derived a large part of our knowledge of Greek geometry. Many of the writings here analysed are no longer extant, and it is on the indications (in the notable instance of Euclid's *Porisms*, the very obscure indications) which Pappus gives of the object or the contents of them that the geometers of the 17th and 18th centuries relied for their restorations of these writings. The eighth book is devoted mainly to mechanics. The mathematical interest of the *Collection* does not equal the historical, but several of the books contain important theorems, the discovery of which is probably due to Pappus himself. One of these has been long associated with the name of Guldinus (1577-1643). Some others have received a brilliant development from the mathematicians of modern times. The last six books of the *Mathematical Collection* were translated into Latin by Commandinus, an Italian geometer, and were published in 1588; another edition appeared in 1660. Fragments of the Greek text have been printed at various times in England, France, and Germany, but the only complete edition is that of Fridericus Hultsch, *Pappi Alexandrini Collectionis quæ supersunt* (3 vols. Berlin, 1876-78).

Papua. See NEW GUINEA.

Papules, or PIMPLES, are 'solid small elevations of the skin,' and may be either pale in colour

or inflammatory and more or less red. Papules occur as an early stage in the development of the eruption in many skin diseases—e.g. in eczema, where they speedily become vesicles; or in acne, where they become pustules. The papular diseases proper, where the eruption in its fully developed form consists of papules, are lichen and prurigo.

Papyrus, a genus of plants of the natural order Cyperaceæ, of which there are several species, the most important being the Egyptian Papyrus or *Papyrus* of the ancients (*P. antiquorum*, *Cyperus papyrus* of Linnaeus)—a kind of sedge, 8 to 10 feet high, with a very strong, woody, aromatic, creeping root, long, sharp-keeled leaves, and naked, leafless, triangular, soft, and cellular stems, as thick as a man's arm at the lower part, and at their upper extremity bearing a compound umbel of extremely numerous drooping spikelets, with a general involucre of eight long filiform leaves, each spikelet containing six to thirteen florets. By the ancient Egyptians it was called *papu*, from which the Greek *papyrus* is derived, although it was also called by them *byblos* and *deltos*. The Hebrews called it *gomê*, a word resembling the

Papyrus.

Coptic *gom*, or 'volume'; its modern Arabic name is *berdi*. The plant is nearly extinct in Lower Egypt, but is found in Nubia (whence it was probably introduced into Egypt) and Abyssinia. It still grows in the Jordan Valley, in the neighbourhood of Jaffa, and also of Sidon, in parts of the Sinai Desert, and in Sicily. It is often a conspicuous feature in African vegetation. It is represented on the oldest Egyptian monuments, and as reaching the height of about ten feet. It was grown in pools of still water, growing ten feet above the water, and two beneath it, and restricted to the districts of Sais and Sebennytus. The papyrus (not merely *P. papyrus*, but *P. dives*, which is still found in Egypt) was used for many purposes, both ornamental and useful, such as wreaths for the head, sandals, boxes, boats, and cordage, but the *P. papyrus* was valued principally for a kind of paper called by its name. Its pith was boiled and eaten, and its root dried for fuel. The papyrus or Paper (q.v.) of the Egyptians, made of strips of its pith in layers, was of the greatest reputation in antiquity, and it appears on the earliest monuments in the shape of long rectangular sheets, which were rolled up at one

end, and on which the scribe wrote with a reed called *kash*, with red or black ink made of an animal carbon. When newly prepared it was white or brownish white and lissom; but in the process of time those papyri which have reached the present day have become of a light or dark brown colour, and exceedingly brittle, breaking at the touch. Papyrus was commonly used in Egypt for the purposes of writing, and was, in fact, the paper of the period; but, although mentioned by early Greek authors, it does not appear to have come into general use among the Greeks till after the time of Alexander the Great, when it was extensively exported from the Egyptian ports under the Ptolemies. It was, however, always an expensive article to the Greeks. Among the Romans it does not appear to have been in use at an early period, although the Sihylline books are said to have been written on it. It was cultivated in Calabria, Apulia, and the marshes of the Tiber, but the staple was no doubt imported from Alexandria. So extensive was the Alexandrian manufactory that Hadrian, in his visit to that city, was struck by its extent. It continued to be employed in the eastern and western empire till the 12th century, and was used amongst the Arabs in the 8th; but after that period it was quite superseded by parchment or by paper made of rags. During the later periods it was no longer employed in the shape of rolls, but cut up into square pages, and bound like modern books.

The discovery in Egypt of classical Greek authors written on papyrus began about the middle of the 19th century, and the results have been on the whole beyond expectation. The great orator Hyperides (q.v.), then only known by name, is now represented by four or five pretty complete orations; fragments of Euripides and Aleman have been added to what we possess of these authors, and early MSS. have been obtained of parts of Homer, Plato, Thucydides, Demosthenes, and Isocrates. In 1888-89 Mr Flinders Petrie found near Medinet el Fayûm papyri which were identified as fragments of Plato's *Phædo*, transcribed about 250 B.C., and a part of the lost *Antiope* of Euripides, besides quantities of letters and documents of the Ptolemaic period. In January 1891 more than 160 ancient mummies (dating from the 20th and 21st Dynasties) were found in a subterranean passage at Deir el Bahari, near Thebes; with these were many papyri, containing, as usual, many ritual passages and extracts from the Book of the Dead (q.v.); there were also 'boxes crammed with papyri.' And at the beginning of the same year the world was surprised by the announcement that papyrus rolls obtained from Egypt by the British Museum authorities had been found to contain almost the whole of a lost but famous work of Aristotle on the constitution of Athens. Of these rolls there were four, of which the longest measures seven feet, the shortest three feet. They have been written by four different copyists, are mainly in a small semi-cursive hand, and date from about the end of the 1st century A.D. There are thirty-six columns in all, of which the last six are badly mutilated. The text was edited and published in February 1891 by Mr F. G. Kenyon; a later edition was that of Mr J. E. Sandys.

See PAOLI, *Del Papiro* (1878); also the articles BOOK (and works there quoted), EGYPT, PALÆOGRAPHY, PAPER.

Par. See SALMON.

Pará, the name which the river Tocantins (q.v.) receives in its lower course, from Cameté downwards (138 miles). It is 20 miles broad opposite the city of Pará, and 40 miles broad at its mouth. The Paranan, an arm of the Amazon,

which cuts off Marajó Island from the mainland, pours into it part of the waters of the great river.

Pará (official name *Belém*), a thriving city and seaport of Brazil, capital of the state of the same name, stands on the east bank of the river Pará, 70 miles from its mouth, on a point of land formed by the entrance of the Guandú. The harbour is nearly landlocked by wooded islands, and admits vessels of large size. Pará, as a whole, is a plain-looking commercial town, compactly built, and without straggling suburbs, the dense tropical forest coming close up to the outskirts. The streets are narrow, but regular, well shaded with mangoes and palms, and partly paved; many of the houses, with their blue and white tiled roofs and whitewashed walls, are very pretty. Tram-cars and telephones are in general use, and there is a railway to Bragança (108 miles). The principal buildings are the theatre, the government building, custom-house, and cathedral (1720). The city contains a small fort and botanic gardens. The place is not unhealthy, though the wet season extends over nearly two-thirds of the year. Pará, the headquarters of the 'Amazonian Steamboat Company' and others, is the emporium of the Amazon river-trade, supplying the towns of the interior with foreign goods, and exporting india-rubber, cacao, Brazil nuts, the *pirarucá* fish, &c. The annual value of the exports exceeds £2,500,000. Pop. 40,000. See *Scribner's Monthly* (May 1879), and Vincent, *Around and About South America* (1890).—The state, bordering on Guiana and the Atlantic, and divided by the Amazon, has an area of 443,653 sq. m., and a pop. (1888) of 407,350. 'Para Grass' is a name given to piassava; see FIBROUS SUBSTANCES.

Pa'ra, a coin of copper, silver, or mixed metal, though most generally of copper, in use in Turkey and Egypt; it is the 40th part of a Piastre (q.v.), and varies much in value, owing to the debased condition of the Turkish coinage.

Parable (Gr. *parabolē*, 'a comparison') was originally the name given by the Greek rhetoricians to an illustration avowedly introduced as such. In Hellenistic and New Testament Greek it came to signify an independent fictitious narrative, employed for the illustration of a moral rule or principle. This kind of illustration is of eastern origin, and the greatest examples are to be found in the Old and New Testaments, particularly in the discourses of our Lord. The parable differs from the fable in the probability or verisimilitude of the story itself, and agrees with it in the essential requisites of simplicity and brevity. It is essentially a short allegory marked by probability of incident, and intended to convey one direct moral or spiritual truth. In the course of time the word parable came to lose its significance of figurative speech, and to mean speech generally.

There are works on the parables of our Lord by Archbishop Trench (1846), Calderwood (1890), A. B. Bruce (1882), Goebel (trans. 1883), and Dods (1883). See also the articles ALLEGORY, APOLOGUE, and FABLE.

Parabola, the section of a cone by a plane which is parallel to a generating line. As a particular case, when the plane passes through the vertex of the cone, the parabola closes up into a straight line. A property of the parabola is that the distance of any point on the curve from a certain fixed point is equal to its distance from a certain fixed straight line. The fixed point is called the *focus* of the parabola, and the fixed line is called its *directrix*. In the figure, PAP' represents a parabola of which S is the focus and BC is the directrix. The point A is called the *vertex* of the parabola. The line ASO is the *principal diameter* of the curve; and any line drawn through a point such as P parallel to AO is called a *diameter*.

From the above property it is easy to prove that $PN^2 = 4AS \cdot AN$, where N is the foot of the perpendicular from P upon OA. It is obvious that the parabola is not a closed curve. The centre (corresponding to the centre of the ellipse) is situated

all distances from the source, except in so far as it is affected by absorption, and the parabolic is therefore the most perfect form of reflector (see LIGHTHOUSE, REFLECTION). If the resistance of the air were negligible, the path of a projectile would approximately be a parabola with its axis, or principal diameter, vertical, and its vertex at the highest point of the path. Let $PN = y$, $AN = x$, $AS = a$. The equation of the parabola referred to its vertex as origin is $y^2 = 4ax$. All curves the equations of which are of the form $y^n = px^m$ are classed as parabolas. Thus, the curve represented by the equation $y^2 = px$ is called the *cubical parabola*; and that one whose equation is $y^3 = px^2$ is called the *semi-cubical parabola*.

Paraboloid is a solid figure traced out by a Parabola (q.v.) revolving round its principal axis.

Paracelsus, a name coined for himself by Theophrastus Bombastus von Hohenheim, was apparently meant to imply that he was greater than Celsus; there is no good authority for further adding the names Philippus Aureolus. Paracelsus was the son of Wilhelm Bombast von Hohenheim a physician at Einsiedeln, in the Swiss canton of Schwyz, and was born in 1490, 1491, or 1493 (it seems impossible to decide which). He owed his early education mainly to his father; went to Basel University at sixteen, but soon left to study alchemy and chemistry with Trithemius, Bishop of Würzburg; and next at the mines in Tyrol belonging to the Fugger family learned the physical properties of metals and minerals, and the disposition of rock strata, and began to realise that the observation of nature is of surpassingly greater value to the student than academic prelections or the lucubrations of the study. Here and in subsequent wanderings over great part of Europe he amassed a vast store of facts, learned the actual practice of medicine amongst various peoples, but lost all faith in scholastic disquisitions and disputations. He acquired no little fame as a medical practitioner, and on his return to Basel in 1526 received the appointment of town physician. He also lectured on medicine at the university, but defied academic tradition not merely by lecturing in German (not Latin), but by flouting at Galen and Avicenna—burning their books in public, it was affirmed—and denying all that was most firmly believed by the faculty.

Bitterness, backbiting, enmities soon rose and pursued him throughout the rest of his life,

aggravated and justified in some measure by his own vanity, arrogance, and aggressiveness, as also by his intemperate habits. A dispute with the magistrates in 1528 led to his leaving Basel in haste; he wandered for more than a dozen years, visiting Colmar, Nuremberg, Zurich, Augsburg, and many other towns, but seldom sojourning more than a few months, and at last settled in 1541 under the protection of the archbishop at Salzburg. But he died on the 24th September of the same year—murdered by his enemies, said his friends; in consequence of a drunken debauch, said his enemies.

He is said to have written some 364 works, of which only some 230 were printed; and of these the critics only admit from ten (Marx) to twenty-four (Häser) as genuine, the others being by his followers the 'Paracelsists.' They were mainly written in Swiss-German, the Latin versions being by other hands. About a dozen were translated into English. The earliest printed work was *Practica D. Theophrasti Paracelsi* (Augsburg, 1529). Collected German editions appeared at Basel in 1589-91 (11 vols. 4to) and again in 1603-5 (4 vols. folio; re-issued 1618), Latin editions in 1603-5 (11 vols. 4to) and 1658 (Geneva, 3 vols. folio).

His system was based on a cosmogonic view of the universe, the disturbances in the economy of the human microcosm corresponding to and being determined by the movements of the all-embracing macrocosm. Repudiating the current pseudo-Aristotelianism, Paracelsus turned sympathetically to Neoplatonism and the Cabbala; but it seems difficult not to admit in him an element of pure charlatanism, as well as of mysticism. Unquestionably, however, his method and his influence tended in the direction of the immediate observation of nature, the discarding of antiquated theories, the encouragement of independent research, experiment, and innovation. He is not to be blamed for clinging like his age to Alchemy (q.v.); he certainly made some new chemical compounds, and applied chemical knowledge to improve pharmacy and therapeutics, and, in an empirical fashion, to revolutionise hide-bound medical methods.

See monographs by M. B. Lessing (1839), Marx (1842), Mook (Würzburg, 1876); the article MEDICINE; and the *History of Medicine* by Häser. There is an English *Life of Paracelsus* by Fr. Hartmann (1886); Browning's famous poem on Paracelsus is well known.

Parachute (Fr. *chute*, 'a fall'), a machine for the purpose of retarding the velocity of descent of any body through the air, and employed by aeronauts as a means of descending from Balloons (q.v.). The original type was a gigantic umbrella, strongly made, and having the outer extremities of the rods, on which the canvas is stretched, firmly connected by ropes or stays to the lower part of the handle. It was recommended in 1783 at Lyons by Le Normand as a means of escape from a house on fire, but was first used in connection with ballooning by Blanchard in 1793. In 1887 Baldwin claimed to have descended from a height of one mile by means of a parachute in 3½ minutes.

Paraclete. See SPIRIT (HOLY), MONTANISM, ABELARD.

Paradise (Gr. *paradeisos*, 'a park,' 'a pleasure-ground;' originally an oriental, apparently Persian, word; cf. the Heb. *pardes*, and modern Persian, *firdaus*), the garden of Eden (q.v.), Heaven (q.v.).—See BIRD OF PARADISE for the bird so named.

Paradise-fish (*Macropodus viridi-auratus*), a Chinese species of Macropod often kept in aquaria for its beauty of form and colouring. In the male the colours increase in brilliancy at the pairing-season, and he swims around his wished-for mate, fluttering the long, delicate filaments of the ventral

fin, or erecting those of the tail fin like a peacock's train in miniature.

Paradox (Gr. *para*, 'beside' or 'beyond,' and *doxa*, 'an opinion'), a term applied to whatever is contrary to the received belief; not necessarily an opinion contrary to truth. There have been bold and happy paradoxes whose fortune it has been to overthrow accredited errors, and in the course of time to become universally accepted as truths. For paradoxists who square the circle, and invent perpetual motion, see *QUADRATURE OF THE CIRCLE*, *PERPETUAL MOTION*; and De Morgan's *Budget of Paradoxes* (1872).

Paradoxides Beds (*Paradoxidian*), a term sometimes applied to the Harlech or Longmynd and Menevian rocks of Britain, which are characterised by the presence of trilobites belonging to the genus *Paradoxides*. See *CAMBRIAN SYSTEM*.

Paraffin (so called as being *parum affinis*—i.e. having little affinity—for an alkali) is a name given by Baron Reichenbach (q.v.) to a white transparent crystalline substance first obtained by him in 1830 from wood-tar. The honour of this discovery must be shared with Christison of Edinburgh, who independently and almost simultaneously obtained the same body in making a chemical examination of Rangoon petroleum, and which he named *petroline*. Dumas, a French chemist, obtained it also from coal-tar in 1835. But for twenty years after its discovery paraffin-wax remained a chemical curiosity only. It was not till 1850 that it began to be produced, by Mr James Young, in quantity sufficient to occupy the attention of manufacturers. Since then it has become of great importance commercially, and has for years been the principal material employed in the manufacture of candles in Great Britain and Germany, having for that purpose, to a large extent, superseded the use of beeswax, spermaceti, stearic acid, and tallow, besides being used in many other branches of the arts and manufactures, and in surgery.

The word paraffin, at first applied by Reichenbach to the solid body, is now used by chemists as a generic term for the series of saturated Hydrocarbons (q.v.), the higher members of which are paraffin-wax, lower members are liquid, and the lowest are gases; marsh-gas or firelamp being lowest of all. Paraffin-oil was the term first employed by Mr Young to denominate the mineral burning oils produced by him, and this name still applies in Britain to all the oils associated with the manufacture of paraffin. In these oils, however, the olefine series of non-saturated hydrocarbons is largely represented along with liquid paraffins. But Petroleum (q.v.) is the term in general use to designate the natural oils of America, Russia, and other countries, which are for the most part mixtures of these same two series of hydrocarbons. As the production of paraffin-wax and paraffin-oils has now become an industry of great importance to the world, it will be convenient to make some reference here to the history of its development, particularly in Scotland, which is now the seat of the industry. To a comparatively limited extent coal and shale or schist are made use of in Germany, in France, in Italy, and in Australia for the production of hydrocarbon oils.

In December 1847 Mr James Young received a letter from Dr (Sir Lyon) Playfair, calling his attention to a dark oily liquid found in a coal-mine at Alfreton in Derbyshire. On examining this oil Mr Young recognised the commercial importance of the products that could be obtained from it. He erected a refinery, and produced a light oil for burning, a heavy oil for lubricating, and paraffin-wax. This petroleum spring, at first producing

about 300 gallons per day, had exhausted itself at the end of two years. Meanwhile, Mr Young, reflecting on the probable origin of the oil, and after a series of experiments, succeeded in distilling at a low heat an analogous oil from coal. This process became the subject of his celebrated patent obtained in 1850. Works were erected at Bathgate, in Scotland, in which neighbourhood a highly bituminous cannel coal was at that time being mined for gas-making. It was known as *Torbanehill Mineral* or *Boghead Coal* (q.v.). This mineral was employed by Mr Young, and it yielded under distillation about 120 gallons of crude oil per ton. In 1851, when the Bathgate oil-works were started, the price of this coal was 13s. 6d. per ton, and it gradually rose, till in 1862 it stood at 90s. per ton, when the supply ceased. Mr Young's patent, which covered the distillation of oil from coal at a low red heat, ran from 1850 to 1864. In 1859, however, Mr Robert Bell erected oil-works at Broxburn (q.v.), in which he distilled oil from shale. He was the first in Scotland to use this material, although Du Buisson had obtained a patent in France previous to 1850 for the distillation of schist or shale. Since 1862 this mineral has been, and now is, the only mineral employed in Scotland for oil-making. Soon after Mr Young obtained his patent in 1850 he granted licenses for its use in the United States of America, where oil for several years was distilled from cannel-coal; but public attention being thereby directed to the natural petroleum which have since been found in such abundance, the use of cannel-coal was discontinued. Mr Young was thus the pioneer not only of the paraffin-oil manufacture, but also of the petroleum industries of the world.

During the progress of the shale-oil industry in Scotland it has been frequently subject to serious vicissitudes of fortune, more than once being threatened with extinction. During one of those periods of depression about 1872 the Welsh coal-oil trade collapsed entirely. The Scotch industry was saved from a similar fate by the energy and inventive resource of some of the persons engaged in it. The history of the trade naturally falls into various periods, and during these periods articles of manufacture that were considered by-products, and regarded of little value, or for which there was no market, and products which for years were even unknown came to be of prime importance in the life of the trade. The first period was a brief one (1848-50), when Mr Young utilised the petroleum-spring at Alfreton for the production mainly of lubricating oil, used in mills as a substitute for sperm-oil. The second period extended over the duration of Young's patent (1850-64), when the burning oil had become of the greatest importance to the manufacturer. The third period (1864-72) witnessed the great development of the petroleum trade in America, during which the price of burning oil fell so low that about half of the works in Scotland were closed. The fourth period (1872-78) was a period of severe struggle for existence. The smaller and weaker works disappeared. The production became concentrated in fewer hands with larger outputs. Burning oil being now less remunerative, the utmost attention was paid to the recovery of all waste-products and to the development of the by-products; paraffin-wax and sulphate of ammonia then becoming of chief importance to the manufacturer. Fortunately also the inventive genius, principally of N. M. Henderson, of William Young, and George T. Beilby, and others stimulated by necessity, culminated in the production of new and economical processes whereby manufacturing costs were reduced, and the yield of the products that had now become of most value were much increased. The fifth period (1878-87) was

in consequence a time of much prosperity, ending, however, in a partial collapse by reason of over-production in Scotland combined with ever-increasing imports of wax from America. The sixth period began with 1887. It may be described shortly as the period of combination, the Scotch and American producers having combined to restrict the supplies of paraffin-wax within limits which the markets of the world can absorb.

Geologically, the position of the shale in the east of Scotland is in the Lower Carboniferous series, but in the west of Scotland it is found in the ordinary coal-measures. There are some seven or eight different seams of shale, all varying in position and quality from each other; but the same shale also varies from its normal character in different

districts, being thick and rich in one place, and thin and poor in another. The Broxburn seam of shale at its best is probably the richest and most profitable quality to work; but the Pumpherston seams of shale, though poor in oil, have now become of value, because they are rich in ammonia. The shale is procured in the same manner as in coal-mining.

The following summaries will indicate the material facts in the history of the trade in Scotland, and the direction and extent to which the improved processes have tended—viz. diminished yield of burning oils, increased yield of lubricating oils, paraffin-wax, and sulphate of ammonia, together with reduction of loss in process of manufacture.

SUMMARY NO. 1.

	End of 3d Period—1872.	End of 4th Period—1873.	1880.
Number of works and capital employed.....	51—£1,750,000	18—£1,400,000	18—£2,000,000
Output of shale	800,000	850,000	1,869,300 tons.
Crude oil produced	25,000,000	29,000,000	52,876,700 gallons.
Burning oils produced	11,250,000	11,400,000	21,680,000 "
Lubricating oils produced	2,500,000	5,000,000	9,000,000 "
Paraffin-wax produced	5,800	9,200	22,846 tons.
Sulphate of ammonia.....	2,350	4,750	18,483 "

SUMMARY NO. 2.

SHOWING PERCENTAGE OF PRODUCTS UNDER THE OLD AND NEW SYSTEMS OF WORKING.

	Naphtha.	Burning Oils.	Lubricating Oils.	Paraffin.	Loss in process.
Old System (1880) parts per 100.....	5	40	13	8	84
New System (1880) "	4	35	17	14	30

The first most notable improvement was the Henderson retort, patented by N. M. Henderson in 1873. With this retort the spent shale off which the oil had been distilled, and which still contained about 12 per cent. of carbon, was allowed to descend into the furnace beneath the retort to serve as fuel in the distillation of fresh charges of shale. This effected a great saving of coal and labour, and, on account of mild temperature produced with regularity, there was increased yield of products of better quality and more easily refined.

In 1882 Mr William Young and Mr George T. Beilby, combining the results of their experiments, patented a new retort. It is a combination of two retorts; in the upper one the ordinary oil-products are distilled off, after which the shale is allowed to fall into a firebrick retort below, where a higher heat is employed and in which it is exposed to a current of steam and air; this method gives a greatly increased yield of ammonia; and it is therefore a form of retort of the utmost value in the case of shales rich in nitrogenous and poor in bituminous products.

This was followed in 1883 by Mr Henderson's continuous distillation process, in which the crude oil passes by gravitation through three stills. During the progress of the oil through these stills the fractionation or separation of the crude oil into naphtha, burning oil, and heavy or lubricating oil containing paraffin takes place automatically. In addition to these three stills there are two or more coking stills into which alternately the residue of the crude oil flows and where the distillation is completed, the dry coke being removed from each at regular intervals. The advantages obtained from this process are saving in first cost of plant, saving of labour, time, and fuel; less cost of maintenance; the fractionation of the oil is more perfect and uniform, and the distillates purer, giving less loss in refining. Mr Henderson also, by a patented process, greatly simplified and cheapened the cost of the production of sulphate of ammonia. And his new methods of refrigeration and refinement of the crude paraffin scale increased the yield of wax and improved the quality of the lubricating oils.

In the distillation of bituminous minerals for the production of gas a bright-red heat is employed in order to obtain as much incondensable vapour or permanent gas as possible. The aim of the oil-manufacturer on the contrary is to minimise the production of incondensable gas, and to obtain the highest percentage possible of the liquid and solid hydrocarbons. He therefore reduces the distillation temperature to the lowest practicable point—viz. from 600° to 800° F.

Crude oil is composed of a very wide range of hydrocarbons, each varying in specific gravity and boiling-point and in the percentage of carbon present; but in the practical operations of the refiner the fractionation of the oil is confined within certain definite limits which have been found of most convenience commercially—viz. *Naphtha*, specific gravity, 680 to 750 (water = 1000); volatile at ordinary temperatures; the highest portions are used for carburetting air gas; the heavier portions are principally used as solvents. *Burning oils*—(a) for domestic use; specific gravity, 800 to 805; flash-point, Abel test, about 100° F. (b) Lighthouse oil, specific gravity, 810 to 815; flash-point, Abel test, about 150° F. (c) High Test oils, specific gravity, 830 to 840; flash-point, Abel test, about 240° F.; used in special lamps for lighting railway-carriages and in ships. *Lubricating oils*: These are made of various standard specific gravities—viz. 865, 875, 885, 890–5. They are used principally for mixing with animal and vegetable oils in the preparation of lubricants. *Paraffin-wax*, with melting-points varying from 80° to 130° F. The soft wax from 80° to 100° is employed instead of sulphur in the preparation of ordinary safety-matches, while the harder qualities are manufactured into candles.

The operations in the production and refinement of mineral-oil products stated briefly are: The shale when taken from the pits is broken into small pieces and put into the retorts. In the retort the first chemical process, destructive distillation, takes place. The various products of the oil-works do not exist as such in the shale; they are all created by its destructive distillation. The shale, according to quality, yields from 20 to 40

gallons of crude oil per ton, and over 60 gallons of ammonia water. This water, now such a valuable product to the oil-manufacturer, was allowed for years to go to waste; but in 1864 was for the first time utilised by Mr Bell, who recovered ammonia from it in the form of sulphate.

The operations of the oil-refinery are: (1) distillation, (2) treatment with chemicals, (3) cooling and pressing the heavy oil containing paraffin so as to separate the solid hydrocarbons from the liquid. The oils are distilled several times and are fractionated into the various qualities required; and between each distillation the oil is treated with oil of vitriol and with caustic soda. After the finishing treatment with acid and soda some of the soda compounds are retained in solution by the oil; these have to be carefully removed by washing with water. The absence of acid and alkaline compounds, and thorough fractionation of the oil, are the great secrets in the refining of burning oils; and at some of the works in Scotland the best burning oils that can be obtained are now produced, and the safety of the Scotch oils can be relied upon. In lubricating oils the essential features are high viscosity, high flash-point, and low setting-point. The first two depend on proper fractionation; and the third is secured by careful refrigeration, so that the lowest forms of solid paraffin may be crystallised and separated from the oil.

The crude paraffin scale or wax is refined either by chemicals, by sweating, or by treatment with naphtha. The chemical treatment is seldom used, the greater portion being purified under the sweating process, which is simple and effective. The temperature of the sweating-chamber is raised from 2° to 3° above the setting-point of the paraffin required; the oil then drains off, carrying most of the other impurities with it. But the best qualities of refined paraffin require a treatment or two with shale naphtha. The paraffin is melted, and about 30 per cent. of spirit run in, and after careful stirring together the mixture is allowed to cool down; it is then pressed, when the naphtha runs out, taking the colouring matter with it. This pressed paraffin is again melted and steam blown through it, which carries off the remainder of the naphtha, and finally the melted paraffin is stirred with animal charcoal, settled, and then filtered through cloth and filter-paper, and run into pans to solidify into cakes of convenient size for the candle-maker.

Paraguay, an important river of South America, an affluent of the Paraná (q.v.), rises in the Brazilian state of Matto Grosso. The sources of the river are a number of deep lakes, and 8 miles from its source the stream already has considerable volume. Pursuing a south-west course, and after flowing through a level country covered with thick forests, the Paraguay is joined from the west by the Jauru in 16° 30' S. lat. It then continues to flow south through the Marsh of Xarayes, which, during the season when the stream rises, is an expansive waste of waters, stretching far on each side of the stream, and extending from north to south over about 200 miles. The river still pursues a generally southward course, forming from 20° to 22° S. the boundary line between Brazil and Bolivia, thence flowing south-south-west through the territories of Paraguay to its junction with the Paraná, a few miles above Corrientes. Its chief affluents are the Cuyabá, Tacuary, Mondego, and Apa on the left, and the Jauru, Pilcomayo, and Vermejo on the right. Except in the marshy districts, the country on both banks of the river is rich and fertile, and abounds in excellent timber. The entire length of the river is estimated at 1800 miles; it is navigable for steamers to the mouth of

the Cuyabá. The waters of the Paraguay, which are quite free from obstructions, were declared open to all nations in 1852; and now Brazilian mail-steamers ply monthly between Rio de Janeiro and Cuyabá, on the river of the same name, and there are several lines of steamers between Buenos Ayres and Asuncion.

Paraguay, an inland republic of South America, divided into two distinct portions by the river so named. Eastern Paraguay, or Paraguay proper, is a well-defined territory, nearly in the shape of a parallelogram, extending from 22° to 27° 20' S. lat. and 54° to 58° 40' W. long., bounded on the N. by the rivers Apa and Estrella, on the E. by the mountain-chains of Amambay and Mbaracayú and by the river Paraná, and on the S. by this same river. It contains an area of about 99,000 sq. m., and is bordered by the Brazilian and Argentine republics. Western Paraguay, or the Chaco (see GRAN CHACO), is a quadrilateral, of which one side is formed by the river Paraguay between the mouth of the Pilcomayo and that of the Río Negro. On the west the only definition of a boundary is a line of separation between the Chaco and Bolivia, which has never yet been geographically determined, but which is supposed to pass along the meridian 64° 30' W. The total area of Paraguay is estimated at about 142,000 sq. m.—a territory considerably larger than Great Britain and Ireland. The population of Paraguay is composed of whites of Spanish descent, Indians, a few negroes, and a mixture of these several races, and in 1888 was estimated at 370,753, exclusive of the Indians in the Chaco. A mountain-chain called Sierra Amambay, running in the general direction of from north to south, and bifurcating to the east and west towards the southern extremity, under the name of Sierra Mbaracayú, divides the tributaries of the Paraná from those of the Paraguay, none of which are very considerable, although they are liable to frequent and destructive overflows. The northern portion of Paraguay is in general undulating, covered by low, gently-swelling ridges, separated by large grass plains, dotted with palms. There are mountains in the north-east and north-west corners. The southern portion is one of the most fertile districts of South America, consisting of hills and gentle slopes richly wooded, of wide savannahs, which afford excellent pasture-ground, and of rich alluvial plains, some of which, indeed, are marshy, or covered with shallow pools of water (only one lake, that of Ypoá, deserving special mention), but a large proportion are of extraordinary fertility and highly cultivated. The banks of the rivers Paraná and Paraguay are occasionally belted with forest; but in general the lowlands are destitute of trees. The climate, for the latitude, is temperate, the temperature occasionally rising to 100° in summer, but in winter being usually about 45°. In geological structure the southern part belongs generally to the Tertiary formation; but the north and east present greywacke rocks in some districts. The natural productions are very varied, although they do not include the precious metals or other minerals common in South America. Much valuable timber is found in the forests, and the wooded districts situated upon the rivers possess a ready means of transport. Among the trees are several species of dye-wood, several trees which yield valuable juices, as the india-rubber and its cognate trees, and an especially valuable shrub, the *Maté* (q.v.), or Paraguay Tea, which forms one of the chief articles of commerce, being in general use throughout great part of South America. The shrub or tree grows wild in the north-eastern districts, and the gathering of its leaves gives employment in the season to a large number of the

native population. Native orange woods are common, and more than fifty million oranges are exported annually. Many trees also yield valuable gums. Wax and honey are collected in abundance, as is also cochineal, and the medicinal plants are very numerous. The chief cultivated crops are maize, rice, coffee, cocoa, indigo, manioc, tobacco, and sugar-cane.

The animal world is largely represented in Paraguay, and game, both large and small, is very abundant. Tapirs, jaguars, pumas, ant-eaters, wild-boars, peccaries, and deer of many descriptions are inhabitants of the forests and plains; birds are innumerable, and for beauty and variety of plumage are perhaps unsurpassed by any in the world; the rivers teem with fish, and their banks are the resort of alligators and coypus. Snakes are numerous, but very few of them are venomous. Some of the boas are exceedingly large, and there is a remarkable water-serpent which is said to sometimes attain a length of eight yards.

The commerce of the country greatly increased during the decade 1880-90, and several banks and other mercantile institutions have been established. In 1880 the total value of exports was £252,000, that of imports somewhat less; in 1889-90 their respective values were £597,903 and £344,037. In this latter year the total revenue was £824,935, and the expenditure somewhat in excess. The chief exports are yerba-maté, tobacco, hides, oranges, timber, bark for tanning, and lace; the imports, cotton goods, hardware, wine, grain, rice, linen, silk, petroleum, &c. Trade in the towns is almost wholly in the hands of Italians, French, and Germans. The principal native industries are tanning and the manufacture of pottery and bricks, laces, ponchos, soap, food-pastes, brandy, &c.

Until the war of 1865-70 Paraguay had no national debt, but the utter ruin into which it had then fallen compelled it to have recourse to foreign aid. Two loans were contracted in London in 1871-72, the nominal amount of which was three millions sterling, but only about one-half was placed. The republic defaulted in 1874, but at the end of 1885 a settlement was made with the bondholders whereby the loans were reduced to the sum of £850,000 bearing 2 per cent. interest at the commencement, and gradually increasing to 4 per cent.; and furthermore, 500 square leagues of public lands were ceded by the republic in payment of arrear interest. The service of the new debt has been regularly maintained. There are also obligations or *polizas* assigned as an indemnity to Brazilian and Argentine subjects for losses sustained by them during the war. The total external indebtedness amounts to £4,704,308. There is no internal debt. The military force consists of 500 men. The established religion is the Roman Catholic, the ecclesiastical head of which is the Bishop of Asuncion. Education is free and compulsory; but of the adult Paraguayans only one in five can read and write.

The history of Paraguay is highly interesting. It was discovered by Juan Diaz de Solis in 1515, and further explored by Diego Garcia in 1525, and by Sebastian Cabot in 1526; but the first colony was settled in 1535 by Pedro de Mendoza, who founded the city of Asuncion, and established Paraguay as a province of the viceroyalty of Peru. The warlike native tribe of the Guaranis, however, a people who possessed a certain degree of civilisation, and professed a dualistic religion, long successfully resisted the Spanish arms, and refused to receive either the religion or the social usages of the invaders. In the later half of the 16th century the Jesuit missionaries were sent to the aid of the first preachers of Christianity in Paraguay; but for a long time they were

almost entirely unsuccessful, the effect of their preaching being in a great degree marred by the profligate and cruel conduct of the Spanish adventurers, who formed the staple of the early colonial population. In the 17th century the home government consented to place in the Jesuits' hands the entire administration, civil as well as religious, of the province, which, from its not possessing any of the precious metals, was of little value as a source of revenue; and, in order to guard the natives against the evil influences of the bad example of European Christians, gave to the Jesuits the right to exclude all other Europeans from the colony. From this time forward the progress of civilisation as well as of Christianity was rapid. On the expulsion of the Jesuits from Paraguay in 1768, the history of which is involved in much controversy, the province was again made subject to the Spanish viceroys. For a time the fruits of the older civilisation maintained themselves; but as the ancient organisation fell to the ground great part of the work of so many years was undone, and by degrees much of the old barbarism returned. In 1776 Paraguay was transferred to the newly-formed viceroyalty of Rio de La Plata; and in 1810 it joined with the other states in declaring its independence of the mother-kingdom of Spain, which, owing to its isolated position, it was the earliest of them all to establish completely. In 1814 Dr Francia (q.v.), originally a lawyer, and the secretary of the first revolutionary junta, was proclaimed dictator for three years; and in 1817 his term of the office was made perpetual. He continued to hold it till his death in 1840, when anarchy ensued for two years; but in 1842 a national congress elected Don Mariano R. Alonzo and Don Carlos Antonio Lopez, a nephew of the dictator, joint consuls of the republic. In 1844 a new constitution was proclaimed, and Don Carlos was elected sole president, with dictatorial power, which he exercised till his death in 1862, when he was succeeded by his son, Don Francisco Solano Lopez, whose name has become notorious in connection with the tragic struggle of 1865-70, in which the Paraguayans made a heroic but unavailing fight against the combined forces of Brazil, the Argentine Confederation, and Uruguay. The war was brought to a close by the defeat and death of Lopez at the battle of Aquidaban, March 1, 1870. The results of the war may be read in the returns of the population—(1857) 1,337,439; (1873) 221,079, including only 28,746 men and 108,254 women over fifteen years of age. The sexes are now, however, again nearly equally balanced. Paraguay has had its share of the general emigration of recent years from Europe to South America; and in every way the country has made considerable progress. In June 1870 a congress voted a new constitution, which was proclaimed on the 25th November. It is modelled on that of the Argentine Confederation, the legislative authority being vested in a congress of two houses, and the executive in a president, elected for four years.

Asuncion, the capital, has a population of 34,000, and is connected by a railway 92 miles in length with Villa Rica, the second important town of the republic. It is proposed to prolong this railway to Encarnacion on the river Paraná, a distance of 136 miles, at which point it will form a connection with the Argentine railway system.

Le Paraguay (Paris, 1889); Vincent, *Around and About South America* (1890).

Paraguay Tea. See MATÉ.

Parahyba, capital of the Brazilian state of Parahyba, on the river of the same name, 10 miles from the sea. Its chief buildings are the cathedral and the government palace (formerly the Jesuit college). A large sugar-mill was erected in 1889. At the mouth of the river is a bar; but a railway (12 miles) was built in 1889 to the port of Cabedello, there terminating in a pier in deep water. The annual exports—sugar, cotton, and cottonseed, chiefly to Great Britain—amount to about £200,000. Pop. 14,000.—The state, the easternmost in the republic, has an area of 28,854 sq. m. and a pop. (1888) of 496,618.—There is a more important Parahyba River farther south, which enters the Atlantic, in the state of Rio de Janeiro, after a course of nearly 500 miles. It is navigable for 50 miles from its mouth.

Parallax is the apparent displacement of an object caused by a change of place in the observer. When an object at M is looked at from P it

Fig. 1.

appears in line with some object, S; but after the observer has moved to E, M has apparently moved to a position in line with S'; the amount of apparent motion is called *parallax*. The angle PME is called the 'angle of parallax,' or the 'parallactic angle,' and is the measure of the amount of parallax. To astronomers the determination of the parallax of the heavenly bodies is of the utmost importance, for two reasons—first, from the necessity of referring all observations to the earth's centre—i.e. so modifying them as to make it appear as if they had been actually made at the earth's centre; and secondly, because parallax is our only means of determining the magnitude and distance of the heavenly bodies. The *geocentric* or *daily* parallax—as the apparent displacement of a heavenly body, due to its being observed from a point on the surface of the earth instead of from its centre, is called—is determined as follows: Let

Fig. 2.

Let the *zenith distances*, ZPM and Z'P'M, be observed simultaneously, and, since the latitudes of P and P', and consequently their difference of latitude, or the angle PEP', is known, from these three the angle PMP' (the sum of the parallaxes at P and P') is at once found; and then, by a trigonometrical process, the separate angles or parallaxes PME and P'ME. When the parallax of M, as observed from P, is known, its distance from E, the centre of the earth, can be at once

found. When the heavenly body is on the horizon, as at O, its parallax is at a maximum, and is known as the *horizontal* parallax. The geocentric parallax is of use only in determining the distances of those heavenly bodies at which the earth's radius subtends a considerable angle.

In the case of the fixed stars, at which the earth's radius subtends an infinitesimal angle, it becomes necessary to make use of a much larger base-line than the earth's radius, and, as the largest we can employ is the radius of the earth's orbit, it accordingly is made use of, and the displacement of a star, when observed from a point in the earth's orbit instead of from its centre, the sun, is called the *annual* or *heliocentric* parallax. Here the base-line, instead of being, as in the former case, 4000 miles, is about 92,000,000 miles, and the two observations necessary to determine the parallactic angle are made from two points on opposite sides of the earth's orbit, at an interval as nearly as possible of half a year. Yet, notwithstanding the enormous length of the base-line, it bears so small a proportion to the distances of the stars that only in a few cases have they been found to exhibit any parallactic motion whatever, and very rarely does the angle of parallax amount to 1" (see STARS). The geocentric horizontal parallax of the moon is about 57' 42"; that of the sun, about 88"; and of the double star, 61 *Cygni*, the heliocentric parallax has been determined by Bessel to be '348", equivalent to about 15 millionths of a second of geocentric horizontal parallax. See the articles STARS and SUN.

Parallel Forces are forces which act in parallel lines, such for example as the weights of the portions that make up any framework or structure on the earth's surface. With the exception of a particular case (see COUPLE), parallel forces have always a single resultant, which is readily found by the method of moments. See MOMENT; also FORCE.

Parallel Motion, a name given to any linkage by which circular motion may be changed into straight line motion. The most familiar instance is Watt's parallel motion (see STEAM-ENGINE), which is essentially a three-bar linkage, and, although not theoretically perfect, is sufficiently good for all practical purposes. It is impossible, indeed, to obtain a straight line motion without the use of at least five bars in the linkage; and till 1874, when Hart discovered the method, even this simplest mode of obtaining a true parallel motion was not deemed possible. The Peaucellier cell, a linkage of seven bars, was, however, the earliest linkage discovered for solving the problem of how to draw a straight line. It dates from 1864, and is, perhaps, the most convenient form that has yet been devised. It is shown in the figure. The equal links AP, AQ, BP, BQ, form a rhombus; the long links OA, OB, are also equal, and have the common point O fixed. The seventh link, QC, has its end C fixed, so that Q describes a circle passing through O—i.e. QC equals the fixed distance CO. In these circumstances, when Q moves in its circle P moves in a straight line. See A. B. Kempe's *How to draw a Straight Line* ('Nature' series, 1877).

Parallelogram of Velocities. See COMPOSITION.

Parallelopi'ped (Gr. *parallelepipedon*), a solid figure having six faces, the faces being invariably parallelograms, and any two opposite faces equal, similar, and parallel. If the faces are all squares, and consequently equal, the parallelopi'ped becomes a cube.

Parallels, in military language, are trenches cut in the ground before a fortress, roughly parallel to its defences, for the purpose of giving cover to the besiegers from the guns of the place. See SIEGE.

Paralysis. The term paralysis, while ordinarily used to express loss of power of movement, is used medically in the wider sense of loss of function, so that there may be paralysis of motion, of sensation, of secretion, &c. The term *Paresis* is used to indicate a diminished activity of function. Thus, paresis of a limb means diminished power of moving the limb.

From what is said under the articles BRAIN, NERVOUS SYSTEM, and SPINAL CORD it will be seen that paralysis may arise (1) from destruction of the nerve-cells in the motor area of the surface of the brain; (2) from interruption of the nerve-fibres in their path through the brain to the spinal cord; (3) from interruption of the nerve-fibres in their path through the spinal cord; (4) from disease of the nerve-cells in the spinal cord; (5) from disease or injury to the nerves passing from the spinal cord to the muscles; or (6) from affections of the muscles themselves. Thus, we speak of *Cerebral*, *Spinal*, and *Peripheral Paralysis*.

Cerebral Paralysis.—The most common causes of paralysis from brain disease are the rupture of blood-vessels (see APOPLEXY), or the blocking up of the blood-vessels which pass to the surface of the brain by clots or other solid particles carried from the heart or larger arteries (embolism). Other less frequent causes are tumours, abscesses, &c. The most usual form of paralysis is that termed Hemiplegia, in which there is paralysis of the leg, arm, and muscles of the mouth and tongue on one side of the body, often accompanied, if the disease is on the right side, by the condition called Aphasia (q.v.). If the original condition has been such as merely to produce pressure upon the nerves without their actual destruction, it may be completely recovered from. But this is obviously not very frequent. Hemiplegia may be entirely unaccompanied by any paralysis of sensation, but if the fibres which carry sensory impulses to the surface of the brain be also destroyed there will be a concomitant loss of sensation on the same side as the loss of motion (hemianæsthesia). In certain cases, when the disease of the brain is in the pons Varolii, the mouth may be paralysed on the opposite side from the paralysed limbs. (This depends on anatomical considerations.) Destruction by disease of individual 'motor areas' will obviously lead to paralysis of the corresponding movements.

Spinal Paralysis is usually the result either (1) of pressure upon the spinal cord from the results of curvature or injury of the spine, or of growths such as tumours or abscesses; (2) of disease of the spinal cord itself, especially from tumours or acute or chronic inflammations, which may lead to interruption of the nerve-fibres which pass downwards from the brain to the nerve-cells in the gray matter of the spinal cord; or (3) of direct injury to the spinal cord. If the conducting paths from and to the brain are interrupted in any way, there is complete paralysis of voluntary motion and of sensation below the level of the affected part of the spinal cord, because the motor impulses cannot pass down nor the sensory impulses upwards. At the same time, below the injury reflex movements may be

preserved and certain forms even increased. Such spinal paralysis is termed Paraplegia. If the injury to the spinal cord is localised to one side there will be paralysis of the muscles on the same side, supplied by the nerves arising from the cord below the injury, and of sensibility of the opposite side of the body below the injury (see SPINAL CORD).

In certain cases the nerve-cells in the anterior horns of the gray matter of the cord (and the same may be said of the corresponding cells of origin of the motor nerves of the brain) may be diseased without implication of any other part of the spinal cord. The result of this is paralysis of the muscles supplied by those nerve-cells, and consequent gradual wasting of the muscles. Under this head come those frequent localised paralyzes in the lower limbs of children (the so-called 'essential paralyzes' of children) which affect certain groups of muscles, and lead to such deformities as club-foot and impaired growth of the limbs. A similar disease is sometimes observed in adults (progressive muscular atrophy), which runs a very chronic course and leads to a gradual wasting of muscles, the direct result of a corresponding gradual wasting of the nerve-cells in the gray matter of the cord. The disease called 'bulbar paralysis,' in which there is a slow affection of the muscles of the tongue, of the side of the mouth, and of the larynx, is of this nature, its more rapidly fatal termination being due to the implication of structures so necessary for organic life.

Peripheral Paralyzes.—(a) *From Affections of Nerves.*—These are of extremely frequent occurrence, and may be due to pressure upon, injury to, or disease of the nerves. The most common of these diseases are the inflammations arising from cold, from the excessive use of alcohol, or from exposure to the poison of lead. If the nerve affected be a purely motor nerve the resulting paralysis is purely motor. The typical example is the so-called 'Bell's' or 'facial paralysis,' from affection of the seventh cranial nerve. This arises most commonly either from exposure to draught or from disease of the ear, in the neighbourhood of which the nerve passes through the bones of the skull (see EAR). There results a complete paralysis of the muscles of expression on the corresponding side of the face; the mouth is twisted to the opposite side, the lips cannot be pursed or retracted, the eye cannot be shut, and the forehead can be neither raised nor depressed, while the usual furrows on the forehead and cheek are either obliterated or diminished. The disease is in many cases amenable to treatment, but when associated with disease of the ear it should always be regarded as of grave import. If proper treatment be neglected, the paralysed muscles may waste, and recovery become impossible. 'Lead palsy' is usually indicated by a loss of the power of extending the wrists (wrist-drop) without impairment of sensation (see LEAD-POISONING). An example of paralysis resulting from pressure on a nerve is seen in the not uncommon result of sleeping with the arms over the back of a chair (sleeping or crutch palsy). As the musculo-spinal nerve is compressed, and the muscles which it supplies—namely, those which extend the wrist and fingers, and which turn the forearm outwards (supination)—are paralysed, there is a wrist-drop like that of lead palsy, but in addition there is loss of sensibility (anæsthesia) on the skin of the back of the thumb and first two fingers.

(b) *From Disease of Muscles.*—A very remarkable form of paralysis—affecting mostly the young—is that termed 'pseudo-hypertrophic paralysis,' in which the onset of the paralysis, which is very gradual, is accompanied by a remarkable apparent overgrowth of the muscles, more especially in the

calves of the legs, in the thighs, and back. Examination of the muscles shows that the special muscular tissue is replaced by fat, while the nerves themselves are apparently not diseased. Injury, such as rupture or bruising of muscle, will produce paralysis, which may be only temporary.

Hysterical Paralysis.—Paralysis, which may for the time being be as complete as in any of the cases above described, may occur without any discoverable lesion. To this the term 'hysterical' has been applied (see HYSTERIA). The simulation of organic paralysis by hysteria is frequently so close as to deceive even expert observers. See (Jowers, *Diseases of Spinal Cord and Brain*; Quain's *Dictionary of Medicine*. For 'general paralysis,' see INSANITY, Vol. VI. p. 155.

Paramaribo, the capital of Dutch Guiana, is situated on the Surinam, about 10 miles from its mouth. It has broad, tree-shaded streets, with clean wooden houses, painted light gray, and numerous canals and churches. There are also a governor's palace, two forts, a park, &c. The Herrnhuters (Moravian Brethren) are a strong body in the town. Except for the small harbour of Nickerie, all the trade of the colony is concentrated at Paramaribo. See statistics under GUIANA (DUTCH). Pop. (1884) 24,536.

Paramatta. See PARRAMATTA.

Paramecium, or SLIPPER ANIMALCULE, an Infusorian very common in pond water or in vegetable infusions. In shape it is an asymmetrical oval, in length about $\frac{1}{16}$ of an inch. If dry grass be steeped in a glass of water for some days, the animalcules dormant about the stems revive and multiply very rapidly. Each paramecium is covered with rows of cilia which lash it through the water and drive food-particles into an aperture which serves as mouth. As the food-particles enter they take bubbles of water with them, and are moved round and round in the living substance until they are digested or got rid off. There are two (excretory) contractile vacuoles; the large nucleus has a small one (paranucleus) lying beside it; beneath the thin rind there are remarkable eversible threads. A paramecium often divides transversely into two; these two repeat the process, and with continually diminishing size rapid multiplication may thus proceed for a while. It has its limits, however, and then two individual Infusorians conjugate, exchange some of the material of their paranuclei, and separate. Thus they seem to renew their youth.

Paraná, (1) an important river of South America, rises as the Rio Grande in the Brazilian state of Minas Geraes, about 100 miles NW. of Rio de Janeiro. It flows north-west and west through and along the southern frontier of Minas Geraes, till it unites with the Paranahyba. It then receives the name Paraná, and turns to the south-west and afterwards to the south, separating Paraná state from Matto Grosso and from Paraguay, round the southern border of which republic it sweeps westward to its confluence with the Paraguay River. It then rolls southward through the Argentine provinces, past Santa Fé, below which its channel frequently divides and encloses numerous islands, and finally south-eastward, till it unites with the Uruguay, above Buenos Ayres, to form the Rio de la Plata. The entire length of the river is a little over 2000 miles; it drains an area of more than 1,100,000 sq. m. Its chief tributaries, besides those already mentioned, are the Mogy Guassu, Tieté, Parapananema, Ivahy, Iguaçu, and Salado; at San Pedro (33° 40' S. lat.) a delta begins. The principal towns on its banks are Corrientes, Paraná, Santa Fé, and Rosario—all Argentinian. The river is navigable at all times

to the influx of the Paraguay (705 miles), and except at low water to the mouth of the Iguaçu (460 miles). Immediately above this point occurs one of the most remarkable rapids in the world. It extends for 100 miles in a straight line up the river, between ranges of frowning cliffs which confine the stream to a narrow, rocky bed, little more than 100 yards wide. Through this gorge the water pours in tumultuous fury; for above the rapid the river, then $2\frac{1}{2}$ miles broad, rushes down over the Salto de Guayra, an inclined plane 55 feet high, and then forces its waters, tossing and churning, into the narrow channel below.—(2) A southern state of Brazil, on the coast, with an area of 85,453 sq. m., and a pop. (1888) of 187,548, including several colonies of Germans and Italians. The capital is Curitiba (34,000), with a railway (69 miles) to Paranaguá, the port of the state (pop. 5000).—(3) Capital of the Argentinian province of Entre Rios, stands on a high bluff overlooking the Paraná, opposite Santa Fé, 410 miles by steamer from Buenos Ayres. The town was the capital of the Confederation from 1852 to 1861; afterwards it sank rapidly, but has now again a pop. of 15,000.

Parapet (Ital. *para-petto*, from *parare*, 'to protect,' and *petto*, 'the breast'), a wall raised higher than the gutter of a roof for protection; in military works, for defence against missiles from without (see FORTIFICATION); in domestic buildings, churches, &c., to prevent accident by falling from the roof. In classic architecture balustrades were used as parapets. In early work parapets are generally plain, but in later buildings they are pierced and ornamented with tracery.

Ornamented Gothic Parapet.

In classic architecture balustrades were used as parapets. In early work parapets are generally plain, but in later buildings they are pierced and ornamented with tracery.

Paraphrase (Gr. *para*, 'beside,' and *phrazein*, 'to speak') is the name given to a verbal expansion of the meaning either of a whole book, or of a separate passage in it. A paraphrase consequently differs from Metaphrase, or strictly literal translation, in this, that it aims to make the sense of the text clearer by a lucid circumlocution, without actually passing into commentary. The versified passages of Scripture forming part of the Psalmody of the Scottish Church are known as 'the Paraphrases.' See HYMN, Vol. VI. p. 48.

Paraplegia. See PARALYSIS.

Parasite (Gr. from *para*, 'beside,' *sitos*, 'food'; 'one who eats with another; hence one who eats at the expense of another), a common character in the Greek comedies; a low fellow, who is ready to submit to any indignity that he may be permitted to partake of a banquet, and who lives as much as possible at the expense of others.

Parasitic Animals are those which live on or in other organisms, from which they derive their food. But this mode of life has many forms and degrees; the hosts may be animals or plants; the parasites may be external or internal (ectoparasitic or endoparasitic), fixed or with the power of movement; they may be parasitic temporarily, for a prolonged period, or for the whole life; restricted to one host, or requiring to pass from one kind of animal to another if the life-cycle is to be completed. For the parasitic animals which infest plants, see CORN INSECTS, GALLS, &c.; and ASCARIS, FLUKE, TAPEWORM, THREAD-WORMS, TRICHINA, &c., and other parasites are separately discussed.

Grades of Parasitism.—The grades recognised by Leuckart are: (1) *Temporary Parasitism*.—

'To this category belong almost exclusively ectoparasites, which differ from their free-living relations only in their diet.' (2) *Ectoparasitism*—an established and invariable habit during a prolonged period or during the whole of the parasite's life. This is called 'stationary' ectoparasitism in the translation of Leuckart's great work, but the term hardly suggests the idea. 'These parasites either pass through all their developmental stages on the host, or at first lead an independent existence under a form more or less different from that of the adult.' (3) *Endoparasitism*, in which the parasites are during a great part of their life, and almost invariably during their maturity, 'boarders' within the body of their host. Moreover, all the developmental stages are almost never passed through within one host, a transference from one kind to another being necessary for the completion of the life-cycle. But of endoparasitism there are many varieties.

The Hosts of Parasites.—Probably no animals, except some of the simplest, are free from the attacks of parasites. Yet some are more liable than others—e.g. because they offer greater inducements to those parasitically inclined, because they are more accessible, or because they eat infected food. Thus, vertebrates are more abundantly infested than invertebrates. 'Man has more than fifty distinct species of parasites, the dog and the ox some two dozen each, the frog perhaps twenty.' Some species of parasite are limited to one kind of host; thus, the adults of *Bothriocephalus latus* and *Oxyuris vermicularis* are not known except in man, while *Trichina spiralis* is found in man, pig, rat, dog, cat, ox, &c., and *Distomum hepaticum* in many ruminants and other ungulates, in rodents, in the kangaroo, and in man. The systems most infested are the most accessible—viz. the skin and the alimentary canal, by ecto- and endo-parasites respectively; but there are no organs in which parasites may not be harboured.

Origin of the Parasitic Habit.—It is probable that most cases of parasitism began gradually. Animals found temporary shelter on or in others, and the habit grew upon them. In some cases it might begin fortuitously—e.g. as the embryos or adults wandered or were swallowed; or it might be a shift saving those which adopted it from some presumed keenness in the struggle for existence; or it might simply express a sluggish constitution. In many cases, however, we can hardly doubt that the habit began with the naturally more sluggish females, prompted not by hunger, but by the impulse to seek some conveniently sheltered place for the birth of the young. In fact, there are not a few parasitic female Crustaceans whose mates live freely. Of the evolution of parasites from free-living ancestors the free stages still included in the life-history of most, the close relationships between some free and some parasitic members of the same class—e.g. Crustaceans and Nematodes—and the frequent occurrence of temporary parasitism afford sufficient evidence. It is also instructive to consider the three classes of Plathelminthes—Turbellarians (Planarians, &c.), Trematodes (Flukes, &c.), and Cestodes (Tapeworms, &c.)—of whose genetic relationship there seems little doubt; the Turbellarians are almost all free-living; the Trematodes are mostly external, but sometimes internal parasites; the Cestodes are all endoparasitic.

Life history of Endoparasites.—Most endoparasitic animals have an eventful life-history. They are not always parasites, or they are not always parasites within the same kind of host. Most of them are at some time free; many of them have some sort of metamorphosis. But, as their life-histories are very various, they do not readily admit of being summed up in general statements.

Let us begin, however, with the adult sexual animals. In this state they are always almost parasitic, partly because rich copious diet, warmth, and relative quiescence favour reproductive maturity; partly because many probably began their parasitic career at the reproductive period, when shelter and readily attained food were specially advantageous; partly because it is not likely that animals which had become parasitic would relinquish this habit in adult and mature life. In fact, with the exception of some thread-worms (*Gordius*, *Mermis*, &c.) and some few insects (ichneumon-flies, gad-flies, &c.) which are parasitic in their youth and free as adults, it is generally true of parasitic animals that the eggs are produced, fertilised, and deposited in the parasitic stage. In regard to the reproduction it should be noted (1) that the fertility is often enormous, for a tapeworm may produce 42,000,000 eggs, and a female thread-worm 64,000,000 in a year; (2) that in those cases where the female alone is parasitic fertilisation may take place before parasitism has begun; that otherwise it occurs within the body of the host; that Trematodes and Cestodes are hermaphrodite and sometimes fertilise themselves; (3) that in tapeworms the fixed 'head' buds off a long chain of joints, each of which is sexually complete, becomes eventually distended with eggs and embryos, and is liberated singly or along with others from the intestine of the host.

The eggs or embryos of the parent endoparasite usually pass from the host along with the excreta, and 'there are no intestinal worms, at least among the typical and constant parasites, whose embryos come to maturity near the parent; or, in other words, there are none which pass their whole life-cycle in one locality.' Some of the embryos are locomotor—e.g. those of the liver-fluke and of *Bothriocephalus latus*, which are active migratory; others are passively carried along with food and drink into new hosts. There the embryos rarely become or remain quiescent, but wander from the food-canal through the tissues and organs of the host until a fit resting-place is found. But, to state another of Leuckart's general conclusions, 'the quiescent stage following upon the wandering embryonic stage does not conclude the life-history of the parasite, which requires, in order to complete its development, a radical change in its environment—in other words, a second migration.'

But before leaving the so-called intermediate host—which is different from that of the parent or that of the adult—we should notice that within it asexual multiplication may occur. Thus, several asexual generations characterise that part of a liver-fluke's life during which it sojourns in a water-snail (*Limnaeus*) prior to reaching its final or 'definitive' host in the sheep. In other cases, the asexual multiplication within the intermediate host is of a simpler kind, being restricted to budding, as when the bladder-worm or proscotex of *Tænia echinococcus* within ox or man develops many 'heads' or scolices, each of which on being transferred to dog or wolf will grow into a tapeworm. Or there may be no true multiplication—e.g. in the numerous bladder-worms which form only one head, and remain quiescent until the host happens to be devoured by another, within which the 'head' of the bladder-worm may bud off an adult tapeworm chain.

Connected with this change of host there are two main problems: (1) How is the change effected? (2) how did this extension of the life-history to two distinct hosts arise? In regard to the modes of transference it will be enough to give two illustrations. The young liver-fluke actively migrates from a water-snail and from the water, encysts on stems of grass, and is then eaten by a sheep.

PROTOZOA. Rhizopoda. Gregarinida. Infusoria.	A few parasitic. All parasitic. A few parasitic—e.g. Ichthyophthirius. Opalina. <i>Balantidium coli</i> .	<i>Amoeba coli</i> in man. In all sorts of animals; <i>Coccidium</i> <i>oviforme</i> in man. Outside fishes. In gut of frog. In large intestine of man.	Usually intracellular parasites during part of life. A few occur within the blood-cells of birds, reptiles, &c.
SPONGES. Ccelenterata. 'MESOZOA.'	Probably none in strict sense. Very rare instances: Medusoid <i>Cuscuta</i> (<i>Cunocanthia</i>) parasitica. <i>Cunina</i> (<i>Cunocanthia</i>) octonaria. The Hydroid <i>Polypodium hydri-</i> <i>forme</i> is in one stage parasitic. All parasitic.	In another Medusoid, <i>Geryonia</i> <i>proboscidiata</i> . In the bell of the Medusoid Turritopsis. On the ova of the sterlet (<i>Acipen-</i> <i>ser ruthenus</i>). Orthonectida (<i>Rhopalaria</i>), in a brittle-star (<i>Amphipura aqua-</i> <i>mala</i>), in a Nemertean worm (<i>Lineus lacteus</i>), Dicyemida (<i>Dicyema</i>) in cuttle-fish.	Clione bores in oyster-shells, &c., and cases of commensalism are recorded. A Medusa (<i>Mnemiopsis</i>) on the neck of the pelagic Gasteropod Phylliroe, and the frequent occurrence of a sea-anemone on a hermit-crab illustrate com- mensalism. These forms are perhaps very primitive, perhaps very degen- erate, worm-types.
'WORMS.' Turbellaria (Plan- arians, &c.). Trematoda (Flukes, &c.). Cestoda (Tape- worms, &c.). Nemerteans (Rib- bon-worms). Nematoda (Thread-worms). Acanthocephala. Chaetopoda (bristle-bearing worms). Hirudines (Leeches). Rotifera.	Mostly free-living; a few genera are parasitic: All parasitic, many externally, and usually on one host. Many internally, and then re- quiring two hosts. All parasitic; the mature sexual forms in vertebrates, except in the case of Archigetes, which becomes mature in the fresh- water worm Tubifex. Almost all free-living. Malacobdella. Many parasitic; many free. In man occur <i>Ascaris lumbricoides</i> , <i>Oxyuris vermicularis</i> , <i>Filaria</i> <i>sanguinis hominis</i> , <i>Filaria med-</i> <i>icinalis</i> , <i>Trichinella spiralis</i> , &c. The class includes one genus (<i>Echinorhynchus</i>), and this is parasitic. Almost all free-living. Three or four marine forms are parasitic. Myxostomidae are ectoparasitic and form galls. Most are ectoparasitic (the rest wandering carnivores). Mostly free-living, a few parasitic —e.g. <i>Seison</i> . <i>Albertia</i> .	Graffia in marine molluscs. Anoplodinium in or on Holothu- rians. Especially on fishes. The first usually a mollusc, the second some vertebrate. All sorts of vertebrates contain both stages, the adults in the gut, the immature forms usu- ally in the flesh. But the im- mature stages have also been found in some molluscs, Ar- thropods, and worms. Two occur on crabs. In bivalves. The majority in the digestive tract of vertebrates; but they may be transferred from a lower host to a higher—e.g. from insect to mammal. <i>Ech. proteus</i> lives as adult in pike, &c., in youth in the amphipod <i>Gammarus pulex</i> ; <i>Ech. angustatus</i> of perch in the isopod <i>Asellus</i> . <i>Ech. gigas</i> occurs in the pig. The minute males of Bonellia and Hamingia live within the females. On Crinoids. On molluscs, fishes, amphibians, &c. On crustacean Nebalia. In earthworm and slug.	'Monogenetic.' 'Digenetic.' Two hosts are requisite to com- plete the life-history of the parasite. The final host usu- ally devours the intermediate one. The life-histories are often very complex, and may include al- ternation of generations. Many infest plants. Branchiobdella, which some rank among Chaetopoda, is parasitic on fresh-water crayfish. This family probably represents Chaetopods degenerated by parasitism. In many, however, the ecto- parasitism is very temporary.
ECHINODERMATA.	None parasitic.		
ARTHROPODA. Crustaceans. INSECTS. Arachnida.	There are many parasites among Copepoda—e.g. <i>Chondracanthus</i> . <i>Caligus</i> . Lernæe. Among Cirripedia—e.g. <i>Sacculina</i> . Among Isopods—e.g. <i>Bopyrus</i> and <i>Entoniscus</i> . The vast majority are free-living, but ectoparasitism is illus- trated by Bird-lice (Mallophaga). Lice (Pediculidae). Strepsiptera. (Many are parasitic on plants.) Endoparasitism by the larvae of Ichneumon-flies. Gad-flies. The majority are free-living, but parasitism is illustrated by <i>Linguatulina</i> (Pentastomum). By some Acarina (mites).	Usually on skin, gills, &c. of fishes. Beneath the tail of crabs. On fishes. } Mostly on birds and mammals. In bees and wasps. In other insects. In mammals, cattle, horses, &c. Embryo in rabbit; adult in frontal sinuses of dog and wolf. <i>Demodex folliculorum</i> , <i>Sarcoptes</i> (itch-mite), in skin of man, &c.	These illustrate (a) many grades of parasitism—temporary, peri- odic, thoroughly established, and (b) corresponding grades of degeneration. The females only are parasitic, the males free. With little trace in adult of Arachnid appearance.
MOLLUSCA.	All free-living, except a few Gasteropods. <i>Entoconcha mirabilis</i> . <i>Eulima</i> and <i>Stylifer</i> .	Within Holothurian Synapta. On or in various Echinoderms.	
VERTEBRATA.	The hagfishes (Myxinoidei) are the only parasitic vertebrates.	They are said to eat their way into cods and other fishes.	Precise details are wanting.

Here, and in some other cases, the migration is in part active. On the other hand, the bladder-worm of the pig lies quite passive in the muscles or connective tissue of that animal, and cannot reach its final host unless 'measly' pork be eaten by man. Here, and in most other cases, the migration is passive. The second problem is very difficult. Is the host in which the adult is found the primitive host, and has that of the immature stages been intercalated? or is the intermediate host really the primitive one in which the animals used to become mature, while the final host represents a secondary prolongation of the life-history? Leuckart expresses himself unconditionally in favour of the second theory that 'the intermediate hosts were originally the true definitive carriers, which formerly brought their intestinal worms to sexual maturity, but have since become merely intermediate, because the development of the parasites has extended itself over a greater number of stages in the course of further differentiation.'

The Environment of Parasites.—It is at present debated (see HEREDITY) whether the precise influences exercised on parasites by their hosts are transmissible or not. But it can hardly be doubted that the habits and surroundings of parasites have been somehow influential in their evolution. It is certain that individual parasites may vary in different parts of the body and in different hosts, and it is admitted by all that parasites exhibit 'adaptations' to their life and surroundings. It is therefore important to take account of the precise relations between host and parasite. Ectoparasites will experience mechanical influences due to the movements of their bearers, they will often be carried from one locality to another, they will sometimes share in the warmth of their hosts, they usually find abundant food, and they are often not only sheltered but sedentary. Endoparasites will experience pressure from the tissues in which they lie, or from the peristaltic movements of the food-canal in which they are lodged; their immediate environment usually involves confined space, scant oxygen, considerable warmth, and total darkness; they will be affected by abundant and rich nutrition, by surrounding gases and juices, and by their frequently sedentary life. Now it is at least a plausible theory that the usual absence of sense-organs in endoparasites is due to the unstimulating character of the environment, which has caused them to degenerate, and this view is partly confirmed by the occasional occurrence of sense-organs in the larvæ alone, and by the facts that locomotor appendages are absent or much reduced in the adults of many fixed ectoparasitic crustaceans, because they have gone out of use; that a food-canal is absent in many endoparasites, partly because the superficial absorption of complex surrounding juices left it functionless; that the passivity of many is increased by living in surroundings in which the respiratory processes must be very sluggish; or that the prolific reproduction—especially perhaps the budding growth of tape-worms—is in part due to the abundant and yet stimulating nutrition.

Effects of Parasites on their Hosts.—In the 17th and 18th centuries the injurious effects of parasites were much exaggerated. All sorts of diseases, including many which we now know to be associated with Bacteria, were said to be due to 'worms,' and physicians gravely discussed '*An mors naturalis sit substantia verminosa?*' As accurate diagnosis began to be less unusual, a strange reaction in favour of parasites found many supporters. Intestinal worms were called 'the good angels and unfailing helpers of children,' and were said to aid digestion and even development. But since the middle of the 19th century, when the experimental

study of parasites began in earnest, a knowledge of the various injuries which parasites may do, to man and to domesticated animals at least, has become more and more precise and complete. Only a few illustrations need be given. Numerous large parasites will certainly diminish the nutritive supplies of their host; large bladder-worms and the like press upon adjacent organs, cause obstructions, and give rise to many troubles; the movements and migrations of parasites within the body of their host produce pain and inflammation, and may even result in the perforation and destruction of important organs. Even external parasites may do considerable damage; witness those crustaceans which occur beneath the tails of crabs, and sometimes effect the virtual castration of their hosts. On the other hand, there are many less important parasites whose effects are very slightly if at all injurious. It is a question of much practical importance how the endoparasites which infest man find their way to their host, but as details will be given in such articles as TAPEWORM and TRICHINA, it is enough here to say that food in which parasites are known to lurk should be inspected, cleaned, and sufficiently cooked.

Historical.—Most of the ancient and mediæval naturalists and physicians who expressed any opinion on such matters believed that parasites were spontaneously generated within the bodies of their hosts. It was not till the 17th century, when Swammerdam and Redi showed how maggots, lice, &c. developed from eggs, that the belief in *generatio æquivoca* began to be seriously disputed. It was gradually replaced by the theory that parasites came from without, that, ceasing to be free-living, they entered the bodies of other animals and were there modified. But this conclusion was too hastily leaped at, and no care was taken to prove that the free-living forms in question did really develop into parasites. In many cases, indeed, it was soon shown that they did not, and this disappointing result helped Pallas and others in the latter part of the 18th century to recognise rightly that parasites were propagated like other animals by means of eggs. They concluded, however, that these eggs were more or less directly carried from one host to another, there to develop into the original form, while we know that the life-history of parasites is rarely so simple; nor was there more than a slight warrant for another favourite idea that young animals inherited parasites from their mothers. At the beginning of the 19th century the helminthologists, such as Rudolphi and Bremser, were very active and greatly extended the list of known parasites, but the life-histories remained a puzzle, and many naturalists relapsed into a belief in spontaneous generation. The increasing use of the microscope led to most important results: in 1831 Mehlis discovered the Infusorian-like embryo of certain flukes; Von Siebold (1832) detected the six-hooked embryo within the still unliberated ova of the tapeworm; Eschricht (1841) compared the life-history of internal parasites to that of ichneumon-flies and bot-flies; Steenstrup (1842) published his famous essay on alternation of generations; Von Siebold (1843-50) and Van Beneden (1849-50) worked out the metamorphoses of several parasitic worms; Küchenmeister (1853), Leuckart (1856), and others showed experimentally how infection with larval stages resulted in the development of adult parasites. The foundations of modern helminthology were thus laid, and we have now a vastly increased knowledge of the number of parasites, a precise acquaintance with the life-history and migrations of some of the most important, a scientific system of medical diagnosis and treatment, and some realisation of the general biology of parasitism.

See ASCARIS, BOT, BOTHRIOCEPHALUS, COMMENSALISM, CORN INSECTS, DEGENERATION, ENVIRONMENT, FISH-LOUSE, FLUKE, GALLS, GREGARINIDA, GUINEA-WORM, HAG, LEECH, LOUSE, MITE, TAPEWORMS, THREAD-WORMS, TRICHINA; also Leuckart, *Parasiten des Menschen* (2d ed. 1881 et seq.; trans. by Hoyle, vol. i. Edin. 1886); Küchenmeister, *Parasiten des Menschen* (2d ed. 1878; trans. Ray Society); Cobbold, *Parasites* (1879); Van Beneden, *Vers Intestinaux* (Paris, 1858), *Animal Parasites and Mesmates* (Inter. Sc. Series, Lond. 1876); Von Linstow, *Compendium der Helminthologie* (1878); Moniez, *Les Parasites de l'Homme* (1888).

Parasitic Diseases constitute an important sub-group in the accepted classification of Disease (q.v.). In these diseases certain morbid conditions are induced by the presence of animals or vegetables which have found a place of subsistence within some tissue or organ, or upon some surface of the body of man or other animals. Plants are not exempt from disorders of this nature (see PARASITIC PLANTS). The forms of animal life giving rise to parasitic diseases are described in articles on Ascaris, Cestoid Worms, Flea, Guinea-worm, Itch, Lice, Nematelmia, Strongylus, Tape-worms, Thread-worms, Tick, Trichina, &c.

The vegetable organisms which are associated with special diseases are almost all of microscopic size, and therefore, though their effects are of much greater importance than those of animal parasites, they are as yet much less perfectly understood. Certain minute fungi have long been recognised as the causes of diseases in the skin and mucous membranes: Favus, Pityriasis versicolor, Ring-worm, Thrush (q.v.). It was shown in 1861 by Carter that a serious disease of the foot which occurs in India (Madura-foot, fungus-foot, &c.) is due to the presence of a fungus; and in 1877 what is now called Actinomycosis (q.v.) was put in the same category.

But the most important and interesting of the vegetable parasites are those belonging to the Schizomycetes or Bacteria (q.v.), whose study has assumed such prominence that it is now almost an independent science (Bacteriology). The relations of these organisms to their host are much more intimate than in the case of the larger parasites, and the problems presented by the diseases associated with them are consequently much more difficult of solution; but in some cases the parasitic nature of these diseases has been completely established. Analogy makes it probable that some day all 'specific febrile diseases' will have to be included in this group. See GERM THEORY.

Parasitic Plants are those which, unable to nourish themselves, prey upon other plants or animals; becoming attached, they gain access to the tissues of their host and feed upon its juices. They are more or less degenerate, according to the extent of their parasitism. Any climbing plant is so far a parasite, but, not drawing any nourishment from its host, merely using it as a support, it can live without it, and is perfect in all its parts. Many parasites have probably developed from such plants. The mistletoe, on the other hand, has no roots in the ground; its seed is left by a bird upon an apple or an oak tree, to which, when it begins to grow, it becomes attached by means of special organs called haustoria, which act as roots and enable it to draw crude sap, water, and salts from its host, and having green leaves it can absorb carbonic acid from the air, and elaborate food for its tissues. In the case of the dodder, again, which begins life as an independent plant, the seed germinates underground; when the young plant reaches the surface it fastens upon some host, twining round it, sending its haustoria deep into the tissues, and drawing all its nourishment from them; it bears no green leaves, but only flowers, while the part in

the ground dies. In the Rafflesiaceæ, a foreign order, remarkable for the size of the flowers of some of its genera, the degradation has gone still further, and the whole plant consists of haustoria, a knob-like mass of tissue half formed by the host, and the flowers. There are some parasites which are attached to the roots instead of the stems of their hosts—e.g. Yellow Rattle, Cow-wheat, Eyebright. The attachment by the haustoria is always remarkably intimate; their tissues are always joined to the corresponding ones of the host, often in such a way that it is difficult to say to which plant they belong. The ovules of many parasites are rudimentary, the embryo is small and without chlorophyll; in cases of advanced parasitism it may even produce no leaves. There are parasitic genera in many orders—e.g. Corallorhiza in the Orchideæ, Cuscuta in Convolvulaceæ, Orobranche in Labiatifloræ, Monotropa in Pyrolaceæ. The Loranthaceæ, of which is Viscum the mistletoe, the Balanophoreæ, and the Santalaceæ are families of doubtful affinity. Nearly all these parasites have a marked preference for a particular species of host, and they are all flowering plants. But there are many others; two whole classes, the Bacteria and the Fungi, are either parasitic or, what is much the same thing, saprophytic—i.e. dependent upon decaying organic matter for food. The Bacteria have animals as their hosts, and cause in them many diseases, the species being often recognised by the disease. When they are saprophytic they cause fermentation and putrefaction. The Fungi are many of them a trouble in agriculture, causing corn, hop, and vine mildew, potato disease (see PLANTS, DISEASES OF), and also salmon disease; others, like the mushroom, are saprophytes. Allied to parasitism is Symbiosis (q.v.), a sort of mutually arranged parasitism for the benefit of both parties; as in the case of the Lichens, which consist of Alge and Fungi in partnership.

Paratoluidin. See TOLUIDIN.

Paray-le-Monial, a town in the French department of Saône-et-Loire, 48 miles by rail W. by N. of Mâcon, celebrated for its chapel, in which Mary Alacoque (d. 1690) believed herself to have had a vision of the Saviour, now the object of pilgrimages by the confraternities of the Sacred Heart (q.v.). Pop. 3269.

Parcæ. See FATE.

Parchim, a town of Mecklenburg-Schwerin, 23 miles SE. of Schwerin. Pop. 9726.

Parchment (Fr. *parchemin*, Lat. *pergamena*, through Gr. from *Pergamus*). At a very early period the skins of animals were used for writing upon. Some authors who have written on the subject of ancient writing materials think that the king of Pergamos brought the art of making parchment to perfection through Ptolemy Epiphanes having prohibited the exportation of papyrus from Egypt. The Romans appear to have written chiefly on papyrus, and this practice was continued in Italy till about the 10th century, but parchment was also used; and from that time till ordinary paper became available in the 14th century parchment was almost the only material employed (see PALEOGRAPHY, PAPER). To a limited extent wax tablets and leaden plates were written upon as late as the 14th and 15th centuries, and some of these are preserved at Florence. Some of the earliest printed books were done on vellum (a name originally given to a parchment made of calf-skin), and on a specially fine quality of this substance, made from the skins of calves prematurely born, some of the best of the early miniature portraits were painted. Ordinary parchment is chiefly made of sheep-skins, but those of calves and goats are

also used. Fine parchment and vellum are prepared from the skins of kids, lambs, and young calves. A coarser parchment for drumheads, tambourines, &c. is manufactured from the skins of male goats, wolves, and calves. A peculiar kind is made from asses' skin, and for bookbinders' use a parchment is sometimes prepared from pig-skin. The early stages in the manufacture of parchment are the same as for Leather (q.v.). After being unhaired and cleaned, the skins are stretched evenly upon a stout wooden frame called a *horse*. The flesh side of the skin is first gone over with a double-edged semicircular knife (fleshing-tool) to remove adhering particles of flesh. With the fleshing-tool inverted, to prevent any cutting of the epidermis, the other side of the skin is then scraped to remove dirt and to squeeze out some of the absorbed water. For some purposes for which stout parchment is required the skin is now merely allowed to dry on the frame, no further treatment being required. But fine parchment for writing or drawing upon, some of which is made from split skins, is sprinkled over with sifted chalk on the flesh side and rubbed smooth with a flat surface of pumice-stone. The grain side of the skin also is rubbed over with pumice, but no chalk is used. In these operations great care requires to be taken not to fray the surface, and certain precautions are necessary during the drying of the parchment. Any considerable roughness or unequal thickness is removed by the skin being again scraped and pumiced.

VEGETABLE PARCHMENT.—This substance, which excited much interest and curiosity when it was first introduced, was patented by Mr W. E. Gaine in 1853 (no. of specification, 2834). It is made by dipping ordinary unsized paper for a few seconds in concentrated sulphuric acid mixed with one-half its volume of water, and then quickly removing all trace of the acid. The mixture is allowed to cool before being used. This simple treatment produces a remarkable change in the paper. It acquires a parchment-like texture; turns translucent, especially when thin; and becomes about five times stronger than ordinary paper. Vegetable parchment is also impervious to water, but is rendered soft and limp when dipped into it. The acid produces a molecular change in the Cellulose (q.v.) of which paper consists. A solution of chloride of zinc acts on paper in a similar way. In the manufacture of vegetable parchment a roll of paper is by a mechanical arrangement pulled through a vat containing the sulphuric acid (the time of immersion being from five to ten seconds for thin paper), next through water, then through a weak solution of ammonia, and once more through water. It is afterwards passed through felt-covered rollers, and then calendered. Stout qualities of vegetable parchment have been used for book-covers and for writing deeds upon. Thin sheets of it serve as a convenient material for tracing designs, plans, &c. But it is now chiefly employed for covering jars of preserves and for like purposes.

Pardoe, JULIA, born at Beverley in 1806, published poems and a novel in her fifteenth year, and *Traits and Traditions of Portugal* in 1833. A visit to Constantinople in 1836 led to her *City of the Sultan*, *Romance of the Harem*, and *Beauties of the Bosphorus*. She next visited Hungary, and wrote *The City of the Magyar*, and a novel, *The Hungarian Castle* (1842). A series of works deal with French history—*Louis XIV. and the Court of France* (1847), *The Court and Reign of Francis I.* (1849), *The Life of Mary de Medecis* (1852; new ed. 1891), *A Pilgrimage in Paris*, and *Episodes of French History* (1859). Others of her numerous works are *The Confessions of a Pretty Woman*, *Flies in Amber*, *The Jealous Wife*, *Reginald Lyle*,

Lady Arabella, and *The Thousand and One Days*. She received a pension of £100 in 1859, and died 26th November 1862.

Pardon, in Law, is the remission of the penalty inflicted on an offender who has been tried and convicted, and is an act of grace rather than of justice. The right should be used with great discretion in rectifying an obvious miscarriage of justice, or where, through the inevitable imperfection of all laws, individual cases or offences seem to be visited with too severe a penalty. The power to grant pardons has usually in all monarchical states been regarded as the prerogative of the sovereign; in England a law of 1536 (Henry VIII.) expressly denies to any other than the king the power to pardon or remit treasons or felonies. In republican countries the people is sovereign, but the pardoning power is usually delegated to the head of the executive government for the time being. The United States constitution gives the power to the president to grant reprieves or pardons for offences against the United States, except in cases of impeachment; and in all but seven of the states of the Union the same power is conferred on the governor. In Florida the pardoning power is vested in the governor, the justices of the supreme court, and attorney-general, or a major part of them; in Louisiana the governor pardons only on the recommendation of the lieutenant-governor, the attorney-general, and the presiding judge of the court which tried the case—but only the general assembly may pardon in cases of impeachment and treason; in New Hampshire and Vermont the governor exercises the power with the aid of the executive council; and in New Jersey, Ohio, and Pennsylvania there are boards of pardons—in New Jersey the board consists of the governor, the chancellor, and six judges of the court of errors and appeals. In Britain pardon may also be granted by the supreme authority of the House of Commons; Acts of Indemnity (q.v.) are practically grants of pardon. The sovereign's power of pardon is at all times limited. Thus, he cannot pardon certain offences specified by law (21 Geo. III. chap. 49, excludes the power to pardon convictions for forms of Sabbath-breaking); the king cannot pardon in a matter of private, as opposed to public, wrong, though fines may be remitted in such cases. The endurance of the penalty is said to work out a *constructive* pardon; and the effect of pardon, constructive or other, is to put the offender legally in the position of an innocent man, so that he may proceed at law against any one who thereafter calls him traitor or felon. But civil rights are not overridden by pardon; the injured person may recover damages from a pardoned offender. In modern times the crown's prerogative is delegated, the crown acting not personally but on the representation of the home secretary, the secretary for Scotland, and the lord-lieutenant in Ireland. The pardon is by warrant under the Great Seal, or under the sign-manual countersigned by a secretary of state. To those who have been unjustly convicted, their innocence being subsequently proved, not merely is a free pardon granted, but compensation may also be allowed (see IMPRISONMENT). A notable case of a free pardon long after the condemnation is that of the Earl of Dundonald (q.v.). See also INDULGENCE.

Pardubitz, a town of Bohemia, on the left bank of the Elbe, 55 miles by rail E. of Prague, has a fine 16th-century castle. Pop. 10,292.

Paré, AMBROISE, the father of modern surgery, was born about the beginning of the 16th century, at Laval, in the French department of Mayenne, was trained at the Hôtel Dieu of Paris, and in

1536 as surgeon joined the army starting for Italy. In a later campaign he improved the mode of treatment of gunshot wounds, which had up to this time been of the most barbarous kind—namely, cauterisation with boiling oil. It was during this campaign that he substituted ligature of the arteries for cauterisation with a red-hot iron after amputation. Many other important improvements in surgery were introduced by him at this time. In September 1552 he was appointed surgeon to King Henry II., and afterwards to Charles IX. and Henry III. He died at Paris, December 22, 1590. His writings, of which the principal was *Cinq Livres de Chirurgie* (1582), have exercised a great influence on the practice of surgery in all countries. See his *Life* by Paulmier (Paris, 1884).

Paregoric, or PAREGORIC ELIXIR (from the Gr. *paregoricos*, 'soothing'), the *Compound Tincture of Camphor* of the British Pharmacopœia, consists of an alcoholic solution of opium, benzoic acid, camphor, and oil of anise, every fluid ounce containing 2 grains each of opium and benzoic acid, and $\frac{1}{4}$ grains of camphor. This preparation is much used both by the profession and the public. In doses of from 30 to 60 drops it is an excellent remedy for the chronic winter-cough of old people, the opium diminishing the bronchial secretion and the sensibility of the pulmonary mucous membrane, while the benzoic acid and oil of anise act as stimulating expectorants. It has also been found useful in chronic rheumatism, and, especially in the case of children, to relieve slight pains in the stomach and bowels.

Pareira-Brava, a lofty climbing shrub inhabiting the forests of Peru and Brazil, which bears bunches of oval berries resembling grapes. The botanical source was for some time obscure, but it is now known that the plant yielding the root of commerce is the *Chondodendron tomentosum* (ord. Menispermaceæ). The plant has a long branching woody root, of a yellowish to greenish brown colour internally, and this has attained considerable reputation in medicine. The root contains a bitter principle, and is used in chronic catarrhal affections of the bladder and in calculus. The decoction and fluid extract are most usually employed, but it is sometimes given in the simple form of powder.—This medicinal root has been referred, but erroneously, also to the allied *Cissampelos pareira*, a climbing shrub of the West Indies and Mexico, and to the *Botryopsis platyphylla*—both of which plants have roots possessing similar properties.

Parella, a name given to some of those crustaceous lichens which are used to produce Archil, Cudbear, and Litmus, but which more strictly belongs to one species, *Lecanora parella*, and the red or crimson dye prepared from it.

Parenchyma, a technical name for that kind of vegetable tissue in which the component cells are roundish or polyhedral, touching each other by their broad faces, fitting more or less closely, as in the green 'palisade-parenchyma' of the upper part of a leaf, or leaving wide intercellular spaces, as in the 'spongy parenchyma' of the lower part. See CELL, LEAF.

Parent and Child. The legal relation between parent and child is one of the incidents or consequences of the relation of husband and wife, and flows out of the contract of marriage. The legal is to be distinguished from the natural relation, for two persons may be by the law of nature parent and child, while they are not legally or legitimately so. Hence a radical distinction exists between natural or illegitimate and legitimate children, and their legal rights as against their parents respectively are very different. Legiti-

mate children are the children of two parents who are recognised as married according to the laws of the country in which they are domiciled at the time of the birth; and, according to the law of England, if a child is illegitimate at the time of the birth, nothing that can happen afterwards will ever make it legitimate, the maxim being 'once illegitimate always illegitimate.' In Scotland, on the other hand, a child born of parents who were not married at the time of the birth is made legitimate by their subsequent intermarriage. For a statement of the law relating to illegitimate children, see the articles BASTARD, AFFILIATION, LEGITIMATION, and see also FAMILY, INFANT.

As regards the maintenance of the child, it is somewhat singular that, according to the law of England, there is no duty whatever on the parent to support the child, and consequently no mode of enforcing such maintenance. The law of nature was probably considered sufficient to supply the motives which urge a parent to support the child, but the municipal law of England has not made this duty compulsory. This defect was to some extent remedied when the Poor Law was created by statute in the reign of Elizabeth: by that law parents and children are compellable to a certain small extent, but only when they have the pecuniary means to do so, to support each other, or rather to help the parish authorities to do so. But apart from the poor-law statutes there is no legal obligation on the parent to support the child, nor on the child to support the parent. Hence it follows that, if the child is found in a destitute state, and is taken up, fed, clothed, and saved from starvation by a stranger, it is questionable whether such a stranger can sue the parent for the expense, or any part of it, however necessary to the child's existence. In order to make the father liable for maintenance there must in all cases be made out against him some contract, express or implied, by which he undertook to pay for such expense; in other words, the mere relationship between the parent and child is not of itself a ground of liability. But when the child is living in the father's house, it is always held by a jury or court that slight evidence is sufficient of, at least, an implied promise by the father to pay for such expenses. For example, if the child order clothes or provisions, and the father see these in use or in process of consumption, it will be taken that he assented to and adopted the contract, and so will be bound to pay for them. So, if a parent put a child to a boarding-school, very slight evidence of a contract will be held sufficient to fix him with liability. Nevertheless, in strictness of law, it is as necessary to prove a contract or agreement on the part of the parent to pay for these expenses as it is to fix him with liability in respect of any other matter. If a child be put under the care and dominion of an adult person, and the latter wilfully neglect or refuse to feed or maintain such child, whereby the child dies or is injured, such adult will incur the penalties of misdemeanour; but this offence does not result from the relationship of parent and child; it may arise between an adult and child in any circumstances, as where a child is an apprentice or servant. If a parent runs away and deserts his children, leaving them destitute and a burden on the parish, the overseers are entitled to seize and sell his goods, if any, for the benefit and maintenance of such children; and if the parent so deserting the children be able by work or other means to support them, such parent may be committed to prison as a rogue and vagabond. Not only, therefore, is a parent during life not bound to maintain his or her child (with the above exceptions), but after the parent's death the executors or other representatives of the parent, though in possession of

funds, are also not bound. It is true that if the parent die intestate both the real and personal property will go to the children; but the parent is entitled, if he choose, to disinherit the children, and give away all his property to strangers, provided he execute his will in due form, which he may competently do on death-bed if in possession of his faculties.

A father has the right to the custody of his child until majority at least, as against third parties, and no court will deprive him of such custody except on strong grounds. Whenever the child is entitled to property, the court so far controls the parental right that, if the father is shown to act with cruelty, or to be guilty of immorality, a guardian will be appointed. The court has often to decide in cases of children brought before it by *habeas corpus*, when parties have had the custody against the father's will. In such cases, if the child is under fourteen, called the age of nurture, and the father is not shown to be cruel or immoral, the court will order the child to be delivered up to him; but if the child is above fourteen, or, as some say, above sixteen, the court will allow the child to choose where to go. If the parents separate by agreement, no stipulation will be enforced which is prejudicial to the child. In case of divorce or judicial separation the Court of Divorce has power to direct who is to have the custody of the children. The law lays upon fathers the duty of providing their children with an elementary education in reading, writing, and arithmetic; and a father has the right, which the court will not interfere with except on special grounds, to have his children educated in his own religious faith.

Scotland.—The law of parent and child in Scotland differs in some respects from the law of England and Ireland. In Scotland there is a legal obligation on parents and children to maintain each other if able to do so, and either may sue the other for aliment at common law; but this obligation extends only to what may be called subsistence money, although this does not mean merely relief of the poor-law authorities, but is held to vary according to the social position of the party. As regards all maintenance beyond mere subsistence, the law does not materially differ from that of England, and a contract must be proved against the father before he can be held liable to pay. The legal liability as between parent and child is qualified in this way by the common law, that if a person has both a father and a child living and able to support him, then the child is primarily liable, and next the grandchild, after whom comes the father, and next the grandfather. Not only are parent and child liable to support each other while the party supporting is alive, but if he dies his executors are also liable; and this liability is not limited by the age of majority, but continues during the life of the party supported. Another advantage which a Scotch child has over an English child is that the father cannot disinherit it—at least so far as concerns his movable property (see *LEGITIM*). With regard to the custody of children in Scotland, the rule is that the father is entitled to the custody as between him and the mother. His right, however, is not absolute, but subject to the equitable jurisdiction of the Court of Session, which makes such orders regarding custody as are dictated by a regard for the health, interests, and moral education of the child. In actions for separation or divorce this court has power to make such orders as are just and proper regarding the custody of the children of the spouses.

By the Guardianship of Infants Act, 1886, increased rights were given to the mothers of lawful children both in England and Scotland. The general effect of the enactment is to place the

mother of children whose father is dead in a similar position to that which the father would have occupied had he been alive in regard to the guardianship.

United States.—The American law closely follows that of England on this head, save in regard to the age (usually eighteen) at which women cease to be infants. See *INFANT, AGE*.

Parhelion. See *HALOS*.

Pariahs is the Tamil name now generally given to the lowest class of the Hindu population of Southern India—the 'out-castes' who do not belong to any of the four castes of the Brahminical system (the Telugu name is *Mala*, the Kanarese *Holia*, the Malayalam *Paliyar*). In the Madras Presidency they numbered, in 1881, 4,439,253, or 15·58 per cent. of the total population, or four times as numerous as the Brahmans. Presumably they represent the aboriginal race conquered by the Sudras, themselves a stock vanquished by the Vedic peoples. In the 18th century Pariahs were slaves to the higher castes; they must still dwell in huts outside village bounds, but are frugal, pleasure-loving, and laborious. See *CASTE*.—For the Pariah Dog, see *DOG*.

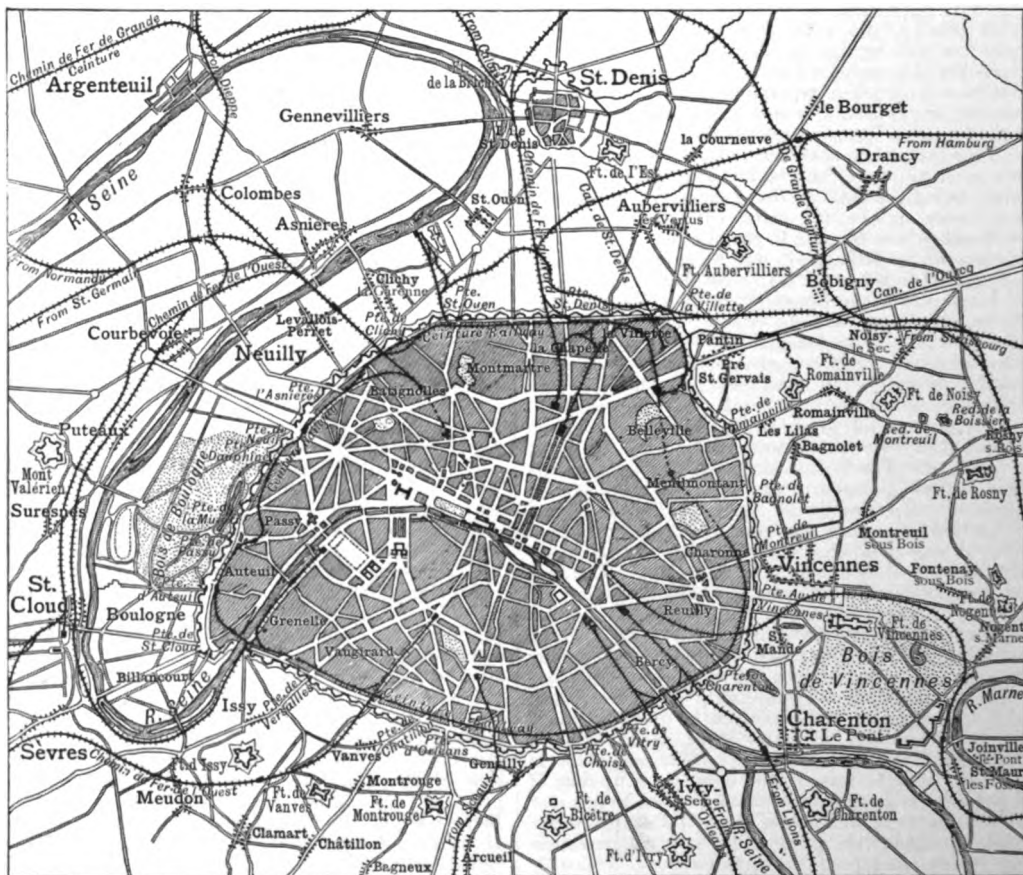

Paris, the capital of France, and the largest city in Europe after London, is situated in 48° 50' N. lat. and 2° 20' E. long., on the river Seine, about 110 miles from its mouth. It lies in the midst of the fertile plain of the Île-de-France, at a point to which converge the chief tributaries of the river, the Yonne, the Marne, and the Oise. These streams, navigable for the small vessels formerly used in commerce, gave it until recent times the advantages of a seaport, while the great trade-routes passing along their valleys connected it with all parts of France. It is still the centre of a great network of rivers, canals, roads, and railways; hence its commercial importance. Paris has occupied since Roman times a constantly increasing series of concentric circles. The present city is bounded by fortifications—a rampart upwards of 22 miles in length, begun in 1840 and completed twenty years afterwards. The extension of the city boundary to this line explains the increase of population from 1,174,346 in 1856 to 1,606,741 in 1861; subsequent pop. (1866) 1,825,274; (1881) 2,269,023; and (1886) 2,256,050. Paris has within the fortifications a mean elevation of about 120 feet, but it rises in low hills north of the Seine, Montmartre (400 feet) and Belleville (320 feet), and south of the Seine, the Montagne Sainte Geneviève (190 feet). These elevations are encircled at a distance of from two to five miles by an outer range of heights, including Villejuif, Meudon, St Cloud, and Mont-Valérien (650 feet), the highest point in the immediate vicinity of the city. The Seine, which enters Paris in the south-east at Bercy, and leaves it at Passy in the west, divides the city into two parts, and forms the two islands of La Cité and St Louis, which are both covered with buildings.

France has long been the most highly centralised country in Europe, and Paris as its heart contains a great population of government functionaries. Paris is a city of pleasure, and attracts the wealthy from all parts of the world. These wealthy inhabitants make it a city of capitalists and a great financial centre. The provincial universities of France have been deprived of their attraction by the schools of Paris, to which flock the youth of France. The publishing trade has followed the same course. Paris cannot be described as a manufacturing town. Its chief and peculiar industries produce articles which derive their value not from the cost of the material,

but from the skill and taste bestowed on them by individual workmen. They include jewellery, bronzes, artistic furniture, and decorative articles known as 'articles de Paris.' In consequence of the intelligence and taste required in their trades, the Paris workmen are in many respects superior to the machine hands of manufacturing cities. The absence of extreme poverty among them and their well-to-do appearance strike the English visitor.

Before speaking in detail of the streets, boulevards, and *places* or squares of Paris, it is proper to mention that the private houses as well as the

public buildings are built of a light-coloured limestone, quarried in the neighbourhood of the city, easily cut with the saw and carved ornamentally with the chisel. With this material they are reared in huge blocks to a height of six or seven stories, each floor constituting a distinct dwelling; access to all the floors in a tenement being gained by a common stair, which is usually placed under the charge of a porter or *concierge* at the entrance. Very frequently the tenements surround an open quadrangle, to which there is a spacious entry, the gate of which (the *porte cochère*)

is kept by a porter for the whole inhabitants of the several stairs. In these respects, therefore, Paris differs entirely from London; for instead of extending rows of small brick buildings of a temporary kind over vast spaces, the plan consists of piling durable houses on the top of each other, and confining the population to a comparatively limited area. In the great new streets which were formed in the time of the Emperor Napoleon III. this general plan has been adhered to, but with this difference, that instead of being narrow and crooked they are wide and straight. Among the finest are the Rue de Rivoli, two miles in length, the Rue de la Paix, the Rue du Faubourg St Honoré, and the Rue Royale. The Boulevards, which extend in a semicircular line on the right side of the Seine, between the nucleus of the city and its surrounding quarters, present the most striking feature of Paris life. In all the better parts of the city they are lined with trees, seats, stalls, kiosques, and little towers, covered with advertisements. Restaurants, cafés, shops, and

various places of amusement succeed one another for miles, their character varying from the height of luxury and elegance in the western Boulevard des Italiens to the homely simplicity of the eastern Boulevards Beaumarchais and St Denis. Among the public squares or *places* the most noteworthy is the Place de la Concorde, which connects the Gardens of the Tuileries with the Champs-Élysées, and embraces a magnificent view of some of the finest buildings and gardens of Paris. In the centre is the famous obelisk of Luxor, covered over its entire height of 73 feet with hieroglyphics. It was brought from Egypt to France, and in 1836 placed where it now stands. On the site of this obelisk stood the revolutionary guillotine, at which perished Louis XVI., Marie Antoinette, Philippe Egalité, Charlotte Corday, Danton, and Robespierre. Of the other squares the following are some of the finest: the Place du Carrousel, including the site of the Tuileries burned by the Commune and not restored; the Place Vendôme, with Napoleon's Column of Victory; the Place de la Bastille, where once stood

that famous prison and fortress; the Place Royale, with its two fountains and a statue of Louis XIII.; the Place de l'Hôtel de Ville, formerly Place de la Grève, for many ages the scene of public executions. Triumphal arches are a feature in the architecture of Paris. The Porte St Martin and Porte St Denis were erected by Louis XIV. to commemorate his victories in the Low Countries, and are adorned with bas-reliefs representing events of these campaigns; the Arc de Triomphe de l'Etoile was begun by Napoleon in 1806, and completed in 1836 at a cost of more than £400,000. This arch, which bounds the Champs-Élysées, has a total height of 152 feet and a breadth of 137. It is profusely adorned with bas-reliefs and alto-reliefs, some of which, representing the departure and return of the Grande Armée, are masterpieces of sculpture. The great streets which radiate from the Arc de Triomphe were among the most magnificent of those constructed by Napoleon III., and make this monument of the Bonaparte family the most conspicuous in Paris. A great avenue runs east from it to the Palace of the Louvre, in the heart of the city.

The Seine in passing through Paris is spanned by twenty-eight bridges. The most celebrated and ancient are the Pont Notre Dame, erected in 1500, and the Pont-Neuf, begun in 1578, completed by Henri IV. in 1604. This bridge, which crosses the Seine at the north of the Île-de-la-Cité, is built on twelve arches, and abuts near the middle on a small peninsula, jutting out into the river, and planted with trees, that form a background to the statue of Henri IV. on horseback, placed in the central open space on the bridge. The bridges all communicate directly with spacious quays, planted with trees, which line both banks of the Seine, and which, together with the Boulevards, give special characteristic beauty to the city. During the last two centuries of the 'ancien régime' the Pont-Neuf was the centre of Paris. It was a meeting-place of showmen and charlatans, and there popular orators addressed the mob. Early in the 12th century Ogival or Gothic architecture took its rise in Paris, or the district immediately surrounding it, this event being one of the most memorable in the history of art. Unfortunately the Parisians, with an impatience of everything not in the latest fashion, long neglected their old buildings in the style they had originated. Their Gothic churches were disfigured by incongruous additions and tawdry ornaments, which make them uninteresting if not repulsive to visitors. This remark, however, does not apply to the first two churches we shall mention. They have been admirably restored, and it is now difficult to say whether their incomparable beauty is to be more attributed to mediæval builders or to the modern architects by whom they have been renovated.

Among the parish churches of Paris (upwards of sixty in number) the grandest and most interesting, from a historical point of view, is the cathedral of Notre Dame, which stands on a site successively occupied by a pagan temple and a Christian basilica of the time of the Merovingian kings. The main building, begun in the 12th century, is 400 feet long, 150 feet wide, and 110 high. The height of two towers is 218 feet, that of the flèche 300 feet. The interior consists of a principal and two flanking

naves, which are continued round the choir. It has been said that if the pillars of Notre Dame could speak they might tell the whole history of France. The kings, however, were crowned at Rheims, and the only royal coronation celebrated at Notre Dame was that of Henry VI. of England in 1431. There, too, was sung in 1436 a memorable *Te Deum* when Paris was retaken by the troops of Charles VII. During the French Revolution the church was mutilated in order to destroy what were supposed erroneously to be emblems of royalty. In 1793, after childish and repulsive mockeries of the ceremonies of the Roman Catholic Church, it was converted into a 'temple of reason.' In 1804 Napoleon I. at the height of his power resolved to impress Europe by an imposing ceremony—that of his coronation—in Notre Dame; and there it was that he, in presence of the pope, who never before had crossed the Alps at the bidding of king or emperor, rudely placed the crown upon his own head. In 1831 the novel of Victor Hugo, *Notre Dame*, made the church interesting to all Europe. In France there was a general desire for its restoration, and in 1845 this great work was undertaken by the state. Viollet-le-Duc added to the building the great flèche, a structure

Notre Dame : from the River.

of oak and lead; and under the care of some of the ablest architects of France the church was converted into what is now described in Paris as the noblest of Gothic buildings. The Sainte Chapelle, built by St Louis in 1245-48, for the reception of the various relics which he had brought from the Holy Land, is perhaps the greatest existing masterpiece of Gothic art. Restored by Napoleon III. at a cost of £50,000, it was threatened by the Commune, but saved. One of the most interesting churches in Paris is St Séverin, buried in narrow streets of the Quartier Latin. A large part of it is in the English Gothic of the 15th century, showing that it was erected during the English occupation of Paris. St-Germain-des-Prés, which is probably the most ancient church in Paris, was completed in 1163; St Etienne du Mont and St Germain l'Auxerrois, both ancient, are interesting—the former for its picturesque and quaint decorations, and for containing the tomb of St Geneviève (q.v.), the patron saint of Paris; and the latter for its

rich decorations and the frescoed portal, restored at the wish of Margaret of Valois. Among modern churches is the Madeleine (1806-42), built in the style of a Corinthian temple, and originally intended by Napoleon I. to be a monument to the Grande Armée. It forms an oblong building, 328 feet long by 138 wide, independently of the flights of steps. The height of the columns is 62 feet, that of the entablature 14 feet, and the entire height from the ground 116 feet. There are in all fifty-two columns. The roof is of iron and copper. The interior is elaborately decorated with gold, white marble, paintings, and sculptures; but in spite of their religious subjects the building still produces on northern eyes the impression of a pagan temple rather than of a Christian church. The Panthéon (1764) was begun as a church, but converted by the Constituent Assembly of republican France into a temple dedicated to the great men of the nation, next restored to the church by Napoleon III. and rededicated to St Geneviève, but once more, on the occasion of the funeral of Victor Hugo (1885), reconverted into a monument, with the old inscription 'Aux grands hommes la patrie reconnaissante.' The Panthéon has been spoken of as rivaling St Peter's at Rome and St Paul's in London. The frescoes of the interior are very fine. In the crypt are the tombs of Voltaire, Rousseau, and Victor Hugo. Notre Dame de Lorette, erected in 1823, is a flagrant specimen of the meretricious taste of the day; and St Vincent de Paul, completed in 1844, is somewhat less gaudy and more imposing in style. Among the few Protestant churches, l'Oratoire is the largest and the best known. In front of it a beautiful monument to Coligny has been erected.

Paris abounds in places of amusement suited to the tastes and means of every class. It has upwards of forty theatres. The leading houses are the Opéra, the Théâtre Français—chiefly devoted to classical French drama—the Opéra Comique, and the Odéon, which receive a subvention from government. The new opera-house, completed in 1875, is one of the most magnificent buildings of this century, costing, exclusive of the site, £1,120,000. Cheap concerts, equestrian performances, and public balls, held in the open air in summer, supply a constant round of gaiety to the burgher and working classes at a moderate cost, and form a characteristic feature of Paris life; while, in addition to the noble gardens of the various imperial palaces, the most densely-crowded parts of the city have public gardens, shaded by trees and adorned with fountains and statues, which afford the means of health and recreation to the poor. Beyond the fortifications at the west of Paris is the Bois de Boulogne, converted by Napoleon III. from a wood covered with stunted trees into one of the most beautiful gardens in Europe. It takes the place of the London parks for the fashionable world of Paris. East of Paris is the Bois de Vincennes, an admirable recreation ground for the working-classes.

Paris has three large and twelve lesser cemeteries, of which the principal one is Père-la-Chaise (see LACHAISE), extending over 200 acres, and filled in every part with monuments erected to the memory of the countless number of celebrated persons buried there. The Morgue (q.v.) at the upper end of the Ile-de-la-Cité is a building in which the bodies of unknown persons found in the Seine are placed temporarily for recognition. The southern parts of Paris are built over beds of limestone, which have been so extensively quarried as to have become a network of vast caverns. These quarries were first converted in 1784 into catacombs, in which are deposited the bones of the dead, collected from the ancient cemeteries of Paris.

It has been frequently remarked that Paris contains few important civil buildings of the middle ages, which is to some extent due to the reckless way in which improvements have been carried out. What Paris has lost in picturesque interest and architectural variety from this cause was brought home to all by the large imitations of the Tour de Nesle and other buildings erected for the exhibition of 1889. A government commission now watches over the historic monuments of Paris, so that further destruction is checked. Two most interesting civil buildings of the 15th century still exist. One is the Hôtel de Cluny (see CLUGNY), one of the finest existing monuments of the Gothic Flamboyant style. The other is the Hôtel de Sens, the old palace of the archbishops of Sens, formerly metropolitans of Paris. It is unfortunately buried among narrow streets north of the Seine and opposite the Cité. In 1890 its most interesting part was advertised 'to let for business purposes.' It had been last used as a sugar-refinery.

The Louvre, the greatest of the modern palaces of Paris, forming a square of 576 feet by 538 feet, was erected on the site of an old castle of the 13th century (see below). The first part, the southwest wing, was erected in 1541 on the plans of Pierre Lescault. It remains a masterpiece of architectural design and monumental sculpture. The principal portion of the great square was completed under Louis XIV. in the latter part of the 17th century, the physician Claud Perrault being the architect. The colonnade of the eastern façade is more admired than any other part of the building.

The Palace of the Tuileries was begun in 1566 by Catharine de Medicis, and enlarged by successive monarchs, while used as a royal residence, until it formed a structure nearly a quarter of a mile in length, running at right angles to the Seine. It was connected with the Louvre, which lay to the west, by a great picture-gallery overlooking the Seine, and 1456 feet in length. North of the picture-gallery, and between the two palaces, lay the Place du Carrousel, in the midst of the most magnificent palatial structure in the world. The Tuileries continued to be occupied as the residence of the imperial family; but the Louvre proper formed a series of great galleries filled with pictures, sculptures, and collections of Egyptian, Greek, and Roman antiquities. The Commune attempted to burn the whole pile, but only succeeded in destroying the Tuileries and a corner of the Louvre. The Place du Carrousel enclosed between them and the Louvre is now thrown into the great line of gardens stretching west to the Arc de l'Etoile. In the midst of the old palaces a statue of Gambetta, surrounded by allegorical figures, has been erected. North of the Louvre is the Palais Royal. It forms a mass of buildings, including the old palace of the Orleans family, the Théâtre Français, and a quadrangle of shops, restaurants, and cafés, enclosing a large park or garden open to the public, 700 feet long by 300 feet wide. With its avenues and parterres it was long one of the liveliest and most frequented spots in Paris. Its cafés had a world-wide reputation, which has faded, however, since the great improvements of Napoleon III. sent the current of life into other quarters. The most valuable part of the palace, fronting the Rue St Honoré, was set fire to by order of the Commune in 1871. The Palace of the Luxembourg, on the south side of the Seine, was built by Marie de Medicis in the Florentine style. It contains many magnificent rooms, and in 1879 became the meeting-place of the French senate. Close to it a gallery has been constructed for the reception of the works of living artists acquired by the state. On the north bank of the Seine, opposite the Island

of the Cité, stands the Hôtel de Ville. It was burned by the Commune, but has been rebuilt and restored in the style of its predecessor, and is now one of the finest buildings in Paris. On the Island of the Cité stands the Palais de Justice, a vast pile, also set fire to by the Commune; some parts of it date from the 14th century, and others are modern. It is the seat of some of the courts of law, as the Courts of Cassation, of Appeal, and of Police. Within the precincts of this palace are the Sainte Chapelle, and the noted old prison of the Conciergerie, in which Marie Antoinette, Danton, and Robespierre were successively confined.

The Conciergerie, just mentioned, in which prisoners are lodged pending their trial, constitutes one of the eight prisons of Paris, of which the principal is La Force. The Nouveau Bicêtre is designed for convicts sentenced to penal servitude for life; St Pélagie receives political offenders, St Lazare is exclusively for women, the Madelonnettes for juvenile criminals, and Clichy for debtors.

The number of benevolent institutions is enormous. The largest of the numerous hospices or almshouses is La Salpêtrière, probably the largest asylum in the world, extending over 78 acres of land, and appropriated solely to old women; Bicêtre receives only men. The Hospice des Enfants Trouvés, or Foundling Hospital (q.v.), provides for the infants brought to it till they reach the age of maturity, and only demands payment in the event of a child being reclaimed. The Crèches (q.v.) receive the infants of poor women for the day at the cost of 20 centimes. Besides institutions for the blind, deaf and dumb, convalescents, sick children, &c., Paris has many general and special hospitals. Of these the oldest and most noted are the Hôtel Dieu, La Charité, and La Pitié.

The chief institutions connected with the University of France, and with education generally, are still situated in the Quartier Latin. The Sorbonne (q.v.), the seat of the Paris faculties of letters, science, and Protestant theology, has been rebuilt and increased in size. The new building was opened in 1889, when it was announced that a complete reorganisation of the university system of France was contemplated (see UNIVERSITY). The Sorbonne contains lecture-halls and class-rooms, and an extensive library open to the public. There gratuitous lectures are given, and degrees are granted by the University of France. Near the Sorbonne is the Collège de France, where gratuitous lectures are also delivered by eminent scholars and men of letters, as well as a large number of colleges and lycées, the great public schools of France for secondary instruction. Most of them have been recently rebuilt, filling the Quartier Latin with huge barrack-like buildings. The Scotch College stands as it did in the 17th century, five stories high, with eleven windows in a row, a good specimen of the old Paris colleges. At present, owing to the war between the republic and the Roman Catholic Church, the schools of the latter are independent of the university, and there is no faculty of Roman Catholic theology at the Sorbonne. The École Polytechnique, the School of Medicine and the School of Law, the Observatory, and the Jardin des Plantes, with its great museums of natural history, partly rebuilt on a grand scale and opened in 1889, lecture-rooms, and botanical and zoological gardens are situated in the same quarter of Paris. The principal of the public libraries are those of the Rue Richelieu, now called the Bibliothèque Nationale (see LIBRARY), which originated in a small collection of books placed by Louis XI. in the Louvre. It is rivalled only by the British Museum in the number of its books and manuscripts, but its usefulness is impaired by the want of a proper cata-

logue, which makes its treasures less accessible than they should be.

No city on this side of the Alps is richer than Paris in fine-art collections, and among these the museums at the Louvre stand pre-eminent. Among its chief treasures may be mentioned, in the museum of antique sculptures, the famous Venus of Milo, and in the Salon Carré the great works of the Italian, Flemish, and Spanish masters. It is impossible to do more than refer to the long succession of galleries in which are exhibited Egyptian, Assyrian, Elamitic, Greek, Roman, mediæval, and Renaissance relics and works of art. The Musée Carnavalet or historical museum of the city of Paris has been specially devoted to the collection of everything interesting connected with the municipality. On the denolition of the old houses many objects were found which formed the nucleus of the collection, which is constantly receiving large additions which make it one of the most interesting of the Paris museums. The Palais des Beaux-Arts is used as an exhibition of art, manufactures, and architectural models. The Hôtel de Cluny, connected underground with the Palais des Thermes, contains curious relics of the arts and usages of the French people, from the earliest ages of their history to the Renaissance period. The potteries, sculptures, paintings, arms, furniture, and tapestries of the middle ages and of the 16th and 17th centuries are of the highest historical interest and value. The Museum of Artillery at the Hôtel des Invalides is devoted to arms and armour, flags and war dresses. The Musée Guimet, or 'National Museum of Religions,' includes objects used in religious ceremonies, savage, Indian, Chinese, &c. The Mint deserves notice for the perfection of its machinery; and the Gobelins (q.v.), or tapestry manufactory, may be included under the fine arts, as the productions of its looms are all manual, and demand great artistic skill. The Conservatoire des Arts et Métiers, in the Rue St Martin, contains a great collection of models of machinery, and class-rooms for the instruction of workmen in all departments of applied science. The great Paris exhibitions have all left behind them important buildings. The Palace of Industry, built in 1854, now forms a permanent exhibition. The spacious building in which the exhibition of 1878 took place was named Palace of the Trocadéro, and is now used for musical entertainments and as an architectural and ethnological museum. For the exhibition of 1889 was erected one of the most striking monuments of modern Paris, the Eiffel (q.v.) Tower.

Paris was surrounded, under Louis-Philippe, with fortifications costing £5,500,000 sterling, and, in addition to these, a large number of detached forts have since been erected. The walls, 37,000 yards in length, are penetrated by sixty-nine openings, fifty-six for gates, nine for railways, two for the canals of St Denis and the Ourcq. Through the two remaining breaks passes the Seine. At the gates are paid the octroi or town dues, a large source of revenue to the city of Paris. On the left bank of the Seine is the École Militaire, founded in 1752, and used as barracks for infantry and cavalry; it can accommodate 10,000 men and 800 horses. Near it is the Hôtel des Invalides, founded in 1670 for disabled soldiers. The crypt of the church contains the sarcophagus, hewn from a huge block of Russian granite, in which lie the remains of Napoleon, deposited there in 1840.

Paris is divided into twenty arrondissements. The prefect of the Seine is the chief of the municipal government, and is appointed by the government. There is a large municipal council, chosen by popular election. Each arrondissement has a maire and two assistant-councillors. The prefect

of police is at the head of the civic guard or *gens-d'armes*, the fire-brigade, and the *sergents de ville* or city police, who are armed with swords. The cleaning, sewerage, and water-supplies of Paris are under the charge of the prefect. Paris is now abundantly supplied with pure and wholesome water; and the sewers have been greatly extended with the street improvements. The same may be said in regard to the paving of the city, and the street-lighting by gas and electricity. In 1818 public slaughter-houses, or *abattoirs*, were established at different suburbs, where alone animals are allowed to be slaughtered. Large cattle-markets are held near the licensed *abattoirs*. There are in the heart of the city numerous *halles*, or wholesale, and *marchés*, or retail markets. The principal of these is the *Halles Centrales*, near the church of St Eustache, covering nearly 20 acres.

History.—The earliest notice of Paris occurs in *Cæsar's Commentaries*, in which it is described, under the name of *Lutetia*, as a collection of mud huts, composing the chief settlement of the *Parisii*, a Gallic tribe, conquered by the Romans. *Lutetia* soon acquired great strategic importance, due to its lines of defence—the windings and marshes of the Seine and Marne to the east and west, and the forest-clad hills on the north and south. It lay midway between the chief enemies of Rome in Gaul, the Germans on the east and the unsubdued Celts of *Armorica* on the west. In 53 B.C., accordingly, *Cæsar* assembled there the delegates of the Gallic tribes, and it became an important Roman town. Two ruins of this period remain south of the Seine. One formed part of the *Palais des Thermes*, the abode of the Roman governors of *Lutetia* and afterwards of the *Merovingian* kings of France. The other ruin is that of the *arènes* or amphitheatre of the Roman city. The foundations and parts of the old wall were discovered in 1870, and since then excavations have laid them bare. In 1891 they were enclosed in a small park and thrown open to the public. The amphitheatre was 180 feet long by 153 feet wide. It is estimated that it could contain 10,000 spectators of the gladiatorial shows. *Lutetia* began in the 4th century to be known as *Parisia*, or *Paris*. In the 6th century Paris was chosen by *Clovis* as the seat of government; and after having fallen into decay under the *Carlovingian* kings, who made *Aix-la-Chapelle* their capital, and in whose time it suffered severely from frequent invasions of the Northmen, it finally became in the 10th century the residence of *Hugh Capet*, and the capital of the French monarchy. From this period Paris continued rapidly to increase, and in two centuries it had doubled in size and population. The reign of *Philippe-Auguste* (1180–1223) is the great epoch in the mediæval history of Paris. It was then that were erected masterpieces of Gothic art, including the nave, the choir, and the chief façade of *Notre Dame* and the *Sainte Chapelle*. Then was founded the University of Paris, the great theological school of the middle ages, wielding a power over the church second only to that of Rome, and attracting from all parts of western Europe vast crowds of students, who, on returning to their homes, spread abroad a knowledge of the art and culture of Paris. *Philippe-Auguste* built a crenelated wall and flanking towers, one of which, the *Tour de Nesle* (q.v.), stood on the site of the Palace of the Institute. Outside the wall he erected the castle of the Louvre on the site of the present palace. It became the centre and stronghold of feudalism and the citadel of Paris, which was now, after *Constantinople*, the greatest city of Europe. In the 16th century the castle was still used as a royal residence, but after the reception of *Charles V.* there by *Francis I.* it was pulled

down to make way for the new palace. Luckily the walls were not levelled to their foundations. A few years ago they were discovered to exist. Galleries have been excavated, and extensive ruins have been laid bare, which now form the most interesting sight of underground Paris.

In the middle ages Paris was divided into three distinct parts—the *Cité*, on the islands; the *Ville*, on the right bank; and the *Quartier Latin*, or University, on the left bank of the river, and on the *Montagne St Geneviève*. In 1358 broke out the first of the long series of Paris revolutions. It was headed by *Étienne Marcel*, the famous provost of the Paris merchants, who for a time ably ruled the town. *Louis XI.* did much to enlarge Paris and to efface the disastrous results of its hostile occupation by the English during the wars under *Henry V.* and *Henry VI.* of England; but its progress was again checked during the wars of the last of the *Valois*, when the city had to sustain several sieges. On the accession of *Henri IV.* of *Navarre*, in 1589, a new era was opened for Paris. The improvements commenced in his reign were continued under the minority of his son, *Louis XIII.* *Louis XIV.* converted the old ramparts into public walks or *boulevards*, organised a regular system of police, established drainage and sewerage works, founded hospitals, almshouses, public schools, scientific societies, and a library, and thus renewed the claim of Paris to be regarded as the focus of European civilisation.

The terrible days of the Revolution caused a temporary reaction; but the improvement of Paris was recommenced on a new and grander scale under the first *Napoleon*, when new quays, bridges, markets, streets, squares, and public gardens were created. All the treasures of art and science which conquest placed in his power were applied to the embellishment of Paris, in the restoration of which he spent more than £4,000,000 sterling in twelve years. His downfall again arrested progress, and in many respects Paris fell behind other European cities. Renovation was recommenced under *Louis-Philippe*; but as lately as 1834 much of the old style of things remained; the gutters ran down the middle of the streets, there was little underground drainage from the houses, oil-lamps were suspended on cords over the middle of the thoroughfares, and, except in one or two streets, there were no side-pavements. It was reserved for *Napoleon III.* to reconstruct Paris. When he commenced his improvements Paris still consisted, in the main, of a labyrinth of narrow, dark, and ill-ventilated streets. He resolved to pierce broad and straight thoroughfares through the midst of these—thus putting an end to the possibility of forming barricades—to preserve and connect all the finest existing squares and *boulevards*, especially those surrounding the monuments of the *Bonaparte* family, and, in lieu of the old houses pulled down in the heart of the town, to construct, in a ring outside of it, a new city in the most approved style of modern architecture. With the assistance of *Baron Haussmann* (q.v.), the Prefect of the Seine, his schemes were carried out with rare energy and good taste. With a fresh supply of water, trees, *parterres*, and fountains were introduced everywhere, and Paris ceased to produce on visitors the impression that it stands in the midst of a chalky desert. It was converted into one of the greenest and shadiest of modern cities. Two straight and wide thoroughfares, parallel to and near each other, crossed the whole width of Paris from north to south through the *Cité*; a still greater thoroughfare was made to run the whole length of the town, north of the Seine, from east to west. The old *boulevards* were completed so as to form outer and inner circles of spacious streets—the former chiefly

lying along the outskirts of the old city, the latter passing through and connecting a long line of distant suburbs. In the year 1867, when the international exhibition was opened, Paris had become in all respects the most splendid city in Europe. Many further improvements were then contemplated. Financial and political difficulties were, however, at hand (see FRANCE), and these schemes had to be postponed. The siege of Paris by the Germans, which lasted from 19th September 1870 to 28th January 1871, caused much less injury to the city than might have been expected—it was reserved for a section of the Parisian population to commit an act of vandalism without a parallel in modern times. On the 18th of March the Red Republicans, who had risen against the government, took possession of Paris. On the 27th March the Commune was declared the only lawful government. Acts of pillage and wanton destruction followed. On the 15th of May the column erected to the memory of Napoleon and the Great Army, in the Place Vendôme, was solemnly pulled down as 'a monument of tyranny.' The government troops under Marshal MacMahon attacked the insurgents, and kept them from doing further mischief. The former succeeded in entering Paris on the 20th of May, and next day the Communists began systematically to set fire with petroleum to a great number of the chief buildings of Paris, public and private. The fire for a time threatened to destroy the whole city. It raged with the greatest fury on the 24th, and was not checked until property had been lost to the value of many millions sterling, and historical monuments were destroyed which never can be replaced. The horror inspired by the Commune for a time drove the wealthy classes from Paris, and it was feared that it would lose its prestige as a European capital. This, however, has not proved to be the case. By the autumn of 1873 all the private houses burned had been rebuilt, the monuments only partially injured had been restored, and the streets and public places were as splendid and gay as in the best days of the empire.

Since the establishment of the republic improvements have been executed little if at all inferior in importance to those of the second empire. New streets have been opened near the Paris Bourse de Commerce and the Post-office; the Champs de Mars, a waste of sand, has been converted into a beautiful garden, in which rises the Eiffel Tower; the museums of the Jardins des Plantes have been rebuilt; the Quartier Latin has been covered with educational buildings. In 1890-91 two great undertakings were mooted—a system of metropolitan railways to connect the great Paris stations with the heart of the city, and the conversion of Paris into a seaport by the deepening of the Seine, or the construction of a ship-canal to the Channel. The enthusiastic advocates of the latter scheme predict that in a few years it will make Paris the largest city in Europe and the centre of the commerce of the world.

Somewhat conflicting opinions are expressed on the part Paris has played in the history of the world. After Athens and Rome, says one writer, it is the city that has made the deepest impression on men's minds. Paris, says another, has carried the torch of life and civilisation from century to century, and done most to spread culture and enlightenment throughout the globe. At this moment, says a third, the inhabitants are the best fed and best clad, the best educated of city populations. These views are generally accepted in France. There is, however, a reverse to the picture. The Parisians are declared to be a feeble people, dying out, and constantly recruited by immigration from Belgium, Alsace, Switzerland,

and Italy. Paris is a modern Babylon; its domestic life, described in French novels, is a centre of corruption for Europe. There has been, no doubt, truth in all these views at different periods of the history of Paris. Certain it is, however, that in England it is too often forgotten that in Paris drunkenness is almost unknown, that among a large section of the population there has always been a pure domestic life, and that the profligacy of the second empire has now ceased to exist.

See the guidebooks of Murray, Baedeker, Joanne, and topographical works by Du Camp (7th ed. 6 vols. 1884), Colin (1885), Pontich (1884), and the official *Annuaire Statistique* (since 1883); G. A. Sala, *Paris Herself Again* (1879); P. G. (2 vols. 1867-68); Hoffbauer, *Paris à travers les Âges* (1890 et seq.); Lebeuf, *Histoire de la Ville et de la Diocèse de Paris* (15 vols. 1764; new ed. by Cocheris, 4 vols. 1863); Dulaure, *Histoire Civile, Physique, et Morale de Paris* (7 vols. 1821; new ed. by Leynadier, 1874); histories by De Gaulle (1840), Gabourd (1863-65), Arago (*Paris Moderne*, 2d ed. 1867); and the copious *Histoire Générale de la Ville de Paris*, issued, since 1866, by the municipal authorities; also histories of the university, in the middle ages by Budinsky (Berlin, 1876), and in the 17th and 18th centuries by Jourdain (Paris, 1862-66). Some account of the siege of Paris in 1870-71 is given at FRANCE, Vol. IV. p. 783. See also Du Camp, *Les Convulsions de Paris* (1875-79); Morin, *Histoire Critique de la Commune* (1871); Vinoy, *Siege de Paris* (1872); Viollet-le-Duc, *Mémoire sur la Défense de Paris* (1872). And on Paris generally, see Lacombe, *Bibliographie de Paris* (1886).

DECLARATION OF PARIS.—In 1856 the representatives of the Powers agreed to four points in International Law (q.v.)—viz (1) Privateering is abolished; (2) the neutral flag covers enemies' goods, excepting Contraband of War (q.v.); (3) neutral goods, with the same exception, are not liable to be seized even under an enemy's flag; (4) blockades, in order to be binding, must be effective. The United States refused to accept the first point, because the European powers declined to affirm that thereafter all private property should be exempted from capture by ships of war. See NEUTRALITY.

TREATIES OF PARIS.—The Peace of Paris of 1763 terminated the Seven Years' War (q.v.); fixed the territorial relations of Germany, France, and Spain; gave to England the French colonies in America; and rearranged the possessions of France and England in the West Indies, India, and Africa. The Treaty of 1814, concluded by the Allies soon after the abdication of Napoleon, reduced France substantially to its old limits. That of 1815, after Waterloo, did so more completely, levied a heavy contribution towards the war expenses, and reconstituted the map of Europe on the old lines. The Treaty of 1856 concluded the Crimean War (q.v.). A Treaty of 1857 arranged relations between Britain and Persia.

Paris, (1) capital of Bourbon county, Kentucky, on Stoner Creek, 19 miles by rail N.E. of Lexington. It contains a military institute, and manufactures whisky, flour, cordage, &c. Pop. (1890) 5505.—(2) Capital of Lamar county, Texas, 98 miles by rail N.E. of Dallas. It has manufactures of brooms, furniture, sashes, wagons, ploughs, &c. Pop. (1890) 8254.

Paris, a genus of plants of the small endogenous natural order Trilliacæ, of which one species, *P. quadrifolia*, called Herb Paris, is not uncommon in moist, shady woods in some parts of Britain. It

is rarely more than a foot high, with one whorl of generally four leaves, and a solitary flower on the top of the stem, followed by a berry. The berry is reputed narcotic and poisonous, but its juice has been employed to cure inflammation of the eyes. The root has been used as an emetic.

Paris, also called ALEXANDER, was, according to Homer, the second son of Priam and Hecuba, sovereigns of Troy. His mother dreamed during her pregnancy that she gave birth to a firebrand, which set the whole city on fire, a dream interpreted by Æscus or Cassandra to signify that Paris should originate a war which should end in the destruction of his native city. To prevent its realisation Priam caused the infant to be exposed upon Mount Ida by a shepherd named Agelaus, who found him five days after alive and well, a she-bear having given him suck. Agelaus brought him up as his own son, and he became a shepherd on Mount Ida. An accident having revealed his parentage, old Priam became reconciled to his son, who married Enone, daughter of a river-god. But his mother's dream was to come true for all that. He was appealed to, as umpire, in a strife which had arisen among the three goddesses, Hera (Juno), Athene (Minerva), and Aphrodite (Venus), as to which of them was the most beautiful, the goddess Eris (Strife) having revengefully flung among them, at a feast to which she had not been invited, a golden apple (of discord) inscribed 'To the Most Beautiful.' Each of the three endeavoured to bribe him. Hera promised him dominion and wealth; Athene, military renown and wisdom; Aphrodite, the fairest of women for his wife—to wit, Helen, the wife of King Menelaus. Paris decided in favour of Aphrodite—hence the animosity which the other two goddesses displayed against the Trojans in the war that followed. Paris now carried Helen away from Lacedæmon in her husband's absence. 'The rape of Helen' is the legendary cause of the Trojan war (see HELEN, TROY). Paris deceitfully slew Achilles in the temple of Apollo. He was himself wounded by a poisoned arrow, and went to Mount Ida to be cured by Enone; but she avenged herself for his unfaithfulness to her by refusing to assist him, and he returned to Troy to die. He was often represented in ancient works of art, generally as a beardless youth of somewhat effeminate beauty.

Paris, COMTE DE. See BOURBON, ORLEANS.

Paris, MATTHEW, the best Latin chronicler of the 13th century, was born about the year 1200, and most probably took the name from his father before him, although he may have owed it either to his having been born at Paris, or to his having studied there. Certain it is he cannot have been a Frenchman, for in patriotic feeling he is thoroughly English. In January 1217 he entered the Benedictine monastery of St Albans, and grew up under the eye of Roger de Wendover, was present along with his prior at the nuptials of Henry III. and Eleanor of Provence (1247), and next year was sent by the pope's recommendation on a mission to repair the financial disorders in the Benedictine monastery on Monk's Island (Holm) near Trondhjem in Norway. In July 1251 he was in attendance at the court at Winchester, six months later he witnessed the marriage at York of Henry's daughter to Alexander II. of Scotland, and in March 1257 he had much conversation with the king during his week's visit to the monastery. His death occurred about the middle of 1259. Matthew Paris's principal work is his *Historia Major*, or *Chronica Majora*, a history from the creation down to the year 1259. The original edition is that published in 1571 under the authority of Archbishop Parker; but the

authoritative edition of the work is that edited by Dr Luard in the Rolls series (7 vols. 1872-83). His conclusion as to its authorship is that down to the year 1189 it was the work of John de Cella, abbot of St Albans from 1195 to 1214; that from that point it was continued by Roger de Wendover down to the year 1235—the whole work to this point being often ascribed to him alone, and known as the *Flores Historiarum*; that Matthew of Paris next transcribed, corrected, and extended (by *interpretation* rather than *interpolation*) the work, which, moreover, from 1235 down to 1259 is entirely his own. As a historian he is vigorous, vivid, and accurate, and his pages are aglow with patriotic fervour. His *Historia Anglorum* is abridged from the greater work by the omission of what relates to foreign affairs. It was edited by Sir F. Madden in the Rolls series (3 vols. 1866-69). Other works are the *Abbreviatio Chronicorum* (1100-1255); *Liber Additamentorum* or *Supplementorum*; the dubious *Duorum Offarum Merciorum Regum Vitæ*; and the valuable *Viginti trium Abbatum S. Albani Vitæ*. See an article by Dr Jessopp in the *Quarterly Review* (1886).

Paris Bordone. See BORDONE.

Parish (Lat. *parochia*; Gr. *paroikia*, 'neighbourhood') is a term used to denote the district assigned to a bishop or priest. In early times the bishop arranged all the church work of his diocese, and the minor churches were served by clergy sent from the bishop's church. Where the church was established and endowed parishes were assigned to resident priests, and tithes were, by special gift or by general rules of law, made payable to the parson of the parish. In England provisions relating to this matter were included among the laws of Edgar about 970. Parishes were formed on the basis of previously existing manors and townships; the lord of the manor often held the Advowson (q.v.) or patronage of the parish church; and the inhabitants held their meetings in the vestry of the church; the parson presided, and he was usually permitted to nominate one of the Churchwardens (q.v.). The parish was originally the unit of administration for poor-law and highway purposes, but modern legislation has transferred many of the functions of parish authorities to Boards of Guardians (see POOR-LAWS) Highway Boards (see ROADS), and County Councils (q.v.). There are about 15,000 civil parishes in England and 900 in Scotland; they vary very widely both in extent and in population. Thus, Queensferry has an area of only 11 acres, Kilmallie (pop. 4157) in Lochaber of 444 sq. m. (nearly as large as Bedfordshire); whilst Whalley in Lancashire (180 sq. m.) has more than 250,000 inhabitants, and Skiddaw (nearly 5 sq. m.) in Cumberland only 10. The boundaries of an ancient parish are fixed by custom, the memory whereof was formerly, and in some cases is still, kept alive by an annual or periodical perambulation (see BOUNDS, BEATING THE). Ancient parishes have been divided and altered in many cases in the exercise of statutory powers; the Local Government Board possesses large powers of alteration. For ecclesiastical purposes populous parishes may be divided and new vicarages constituted by the Ecclesiastical Commissioners; by the exercise of these powers the number of ecclesiastical parishes has been raised to about 13,000. Extra-parochial places, and places formerly described as 'parishes by repute only,' are now represented on Boards of Guardians and rated for local purposes. The system of plural voting in parish meetings is established by an act passed in

1819; all persons paying poor-rates may vote; the number of votes varies with the value of premises occupied; but no person has more than six votes.

The vestry of a parish is either a common vestry—i.e. a meeting of all the ratepaying inhabitants, presided over by the incumbent—or a select vestry, elected under Hobhouse's Act, which was passed in 1831, or under some local act or special custom. There are some politicians who think that legislation has gone too far in transferring administrative powers from parishes to counties and unions; and it is suggested that the Local Government Act of 1888 should be supplemented by an act establishing parish councils with rather extensive powers. The inhabitants of many districts are strongly attached to their existing institutions, and it would not be easy to frame a measure of reform which would be acceptable in all parts of the country. Among parish officers and authorities we include the incumbent, who is usually styled rector or vicar (see the article *TRTHE*). The parson—i.e. person—of a parish is a corporation sole; he has a freehold in his office, and in the church and churchyard, subject to the rules of ecclesiastical law and the rights of the parishioners. The church is used only for the services of the Church of England; the churchyard may be used by Nonconformists, in accordance with the provisions of the Burials Act of 1880. The Churchwardens (q.v.) are elected annually in Easter week; they take care of the church and its furniture, find seats for parishioners attending the services, and usually administer the local charities. Some writers assert that the practice of permitting the incumbent to name a churchwarden is only a courtesy, not a binding custom; but there seems to be no legal decision on the point. Overseers are appointed annually by the local justices, to act along with the churchwardens in administering the poor-law. The care of the poor is now almost entirely transferred to the guardians, but by modern acts of parliament, duties of an extremely miscellaneous character are imposed on overseers. They assist the guardians by keeping registers of persons receiving relief, &c.; and they prepare lists of jurymen, parliamentary voters, &c. A woman may be an overseer. 'Allotment wardens' may be appointed under several acts; but in many places allotment lands are managed by the minister and churchwardens. Parish constables are still appointed in some places, but they are generally superseded by the county police. The poor-rate is used as a general rate, out of which the expenses of local authorities are paid; church-rates are still collected in many parishes, but since 1869 they cannot be levied by compulsory process, and are therefore to be regarded rather as subscriptions than as rates.

In Scotland the ecclesiastical parishes are of very ancient date. The Court of Session, acting as the Commission of Teinds, has power to unite and divide parishes, and to erect a disjoined part into a parish *quoad sacra*—i.e. for ecclesiastical purposes only. Endowed Gaelic congregations in the great towns of the Lowlands may be made parishes *quoad sacra*. The poor-law was formerly administered by the kirk-session in county parishes and by magistrates in burghal parishes; but an Act of 1845 introduced a system of parochial boards, under the general control of the Board of Supervision. The Board may unite two or more parishes for poor-law purposes. The church fabric is supported by the heritors, and highways are not repaired by the parish. There are therefore no churchwardens or way-wardens in Scotland; nor is there any meeting corresponding to the vestry. In the matter of parish schools Scotland was formerly far in advance of England; the policy of the Education Acts is now the same in both countries.

In the United States the term parish is not uncommonly used to denote the district assigned to a church or minister, but there are no civil parishes, except in the state of Louisiana.

See Wright and Hobhouse, *Local Government*; and, for the ecclesiastical part of the subject, Lord Selborne on *Churches and Tithes*.

Parish Clerk. See *CLERK*.

Park, MUNGO, the African traveller, was born 10th September 1771, at Foulshiels on the Yarrow, a farmer's youngest child in a family of thirteen. Educated at Selkirk, he was apprenticed to Dr Thomas Anderson, a surgeon there, and afterwards studied medicine in Edinburgh (1789–91). He was then introduced to Sir Joseph Banks by his brother-in-law, James Dickson, botanist, and obtained the situation of assistant-surgeon in the *Worcester*, bound for Bencoolen in Sumatra. On his return in 1793, the African Association of London had received intelligence of the death of Major Houghton, who had undertaken a journey to Africa at their expense. Park offered his services, was accepted, and sailed from England 22d May 1795. He spent some months at the English factory of Pisanía on the Gambia in making preparations for his travels, and in learning the Mandingo language. Leaving Pisanía on the 2d of December he travelled eastward; but when he had nearly reached the place where Houghton lost his life, he fell into the hands of a Moorish king, who imprisoned him, and treated him roughly. Park seized an opportunity of escaping (1st July 1796), and in the third week of his flight reached the Niger, the great object of his search, at Sego, in 13° 5' N. lat. He followed its course downward as far as Silla; but meeting with hindrances that compelled him to retrace his steps, he pursued his way westward along its banks to Bammaku, and then crossed a mountainous country till he came to Kamalia, in the kingdom of Mandingo (14th September), where he was taken ill, and lay for some time. A slave-trader at last conveyed him again to the English factory on the Gambia, where he arrived, 10th June 1797, after an absence of nineteen months. Bryan Edwards drew up an account of his journey for the Association, and Park published an account of his travels after his return, under the title of *Travels in the Interior of Africa* (1799), a work which at once acquired a high popularity. He now married a daughter of Dr Anderson, his old Selkirk friend (2d August 1799), and settled as a surgeon at Peebles, where, however, he did not feel at home. He told Scott that he would rather brave Africa and its horrors than wear his life out in toilsome rides amongst the hills for the scanty remuneration of a country surgeon; and so, in 1805, he undertook another journey to Africa at the expense of government. As he parted from Scott on Williamhope ridge, his horse stumbled: 'I am afraid, Mungo,' said Scott, 'that is a bad omen.' To which Park replied with a smile, 'Freits (omens) follow those who look to them.' When he started from Pisanía he had a company of forty-five, of whom thirty-six were European soldiers; but when he reached the Niger in August his attendants were reduced to seven. From Sansanding on the Niger, in the kingdom of Bambarra, he sent back his journals and letters in November 1805 to the Gambia, and embarked in an unwieldy half-rotten canoe with four European companions. Through many perils and difficulties they reached Bousa, where the canoe was caught in a cleft of rock; they were attacked by the natives, and drowned as they attempted to escape. An account of Park's second journey was published at London in 1815. Mrs Park was in receipt of a government pension till

her death in 1840. Two of Park's sons joined the Indian army; Thomas, the second son, perished in trying to penetrate the mystery of his father's death. Park's narratives, which are well written, have long held their place amongst the classics of travel, and are of no inconsiderable value, particularly for the light which they throw upon the social and domestic life of the negroes, and on the botany and meteorology of the regions through which he passed; but he was unfortunately cut off before he had achieved the grand aim of his explorations—the discovery of the course of the Niger (q.v.). Park was tall and robust, and possessed of great hardihood and muscular vigour. 'For actual hardships undergone,' writes Joseph Thomson, 'for dangers faced, and difficulties overcome, together with an exhibition of the virtues which make a man great in the rude battle of life, Mungo Park stands without a rival.'

See the *Life* by Wishaw, prefixed to *Journal* (1805), and Joseph Thomson's *Mungo Park* (1890).

Parker, SIR HYDE (1739-1807), a British admiral, of a Devonshire family distinguished both before and after him in the naval service of the country, served in the American war and in the West Indies, and in 1801 was appointed to the chief command of the fleet which was sent to the Baltic to act against the armed coalition of the three northern states of Russia, Sweden, and Denmark. He had no share in the battle of Copenhagen, in which Nelson engaged contrary to his orders; but by his appearance before Carlskrona he compelled the neutrality of Sweden; and he was on the point of sailing for Cronstadt when the news of the Emperor Paul's death put an end to hostilities.

Parker, JOSEPH, a popular preacher and author, the son of a stone-cutter, was born at Hexham, 9th April 1830, and like Spurgeon began to preach in early youth. He studied at Moorfields Tabernacle and University College, London (1852), was ordained pastor of the Congregational Church, Banbury (1853), and became minister of the Cavendish Street Church, Manchester (1858), and of Poultry Chapel, London (1869), now City Temple (opened 1874). He visited the United States in 1888, and received the degree of D.D. from Chicago University. As a preacher he is strong and vigorous, with a splendid command of racy English; he has not unfrequently posed as an oracle on political and ecclesiastical subjects.

He has published *Helps to Truth-seekers* (1857), controversial discourses with secularists at open-air meetings; *Ecce Deus* (1868; 5th ed. 1875), being a reply to *Ecce Homo*; *Ad Clerum* (1870); *City Temple Sermons* (1869-70); *Inner Life of Christ* (1881-82); *Apostolic Life* (3 vols. 1884); *People's Prayer-book* (1889); but his most ambitious work is his *People's Bible*, 'discourses upon Holy Scripture, forming a pastoral commentary,' of which the first volume, *Genesis*, appeared in 1885. See *Tyne Chyde: My Life and Teaching* (new ed. 1889).

Parker, MATTHEW, the second Protestant Archbishop of Canterbury, was born son of a calenderer at Norwich, August 6, 1504, studied at St Mary's Hostel and Corpus Christi College, Cambridge, took orders, and was elected to a fellowship. He was an arduous student of the Scriptures and of church history, yet, in spite of his strong leaning to the past, from an early period he was infected by the new doctrines. In 1535 he was appointed chaplain to the queen Anne Boleyn, and soon after he obtained the deanery of the college of St John the Baptist at Stoke near Clare in Suffolk. Here he lived mainly till 1545, his retiring temper finding pleasure enough in his studies and the administration of the college. In 1538 he was created D.D., next a royal chaplain and canon of Ely, and in 1544 master of Corpus Christi Col-

lege, Cambridge, and the year after vice-chancellor of the university. Two years later he married. He was presented by Edward VI. to the deanery of Lincoln and the prebend of Corringham, but on the accession of Mary he resigned his mastership and was deprived of his preferments, finding safety, however, in strict retirement. The accession of Elizabeth called him from his retirement, and he was consecrated Archbishop of Canterbury in the chapel at Lambeth, December 17, 1559. The ridiculous fable about the informality of the ceremony is discussed under the head of the Nag's Head Consecration.

During his fifteen years' primacy Parker strove to define more clearly the limits of belief and discipline, and to bring about more general conformity. The Thirty-nine Articles were passed by convocation in 1562, and four years later the archbishop issued his 'Advertisements' for the regulation of service, which, with the measures of repression perhaps forced upon him by the imperious queen, provoked great opposition in the ranks of the growing Puritan party. To Parker belongs the merit of originating the revised translation of the Scriptures known as the Bishops' Bible. His wife died in August 1570. Her on one occasion Elizabeth insulted at Lambeth with the words, 'Madam I may not call you, and mistress I am loath to call you: however, I thank you for your good cheer.' Parker died 17th May 1575.

Parker did much for our native annals, but his methods as an editor have not commended themselves to modern scholars. He edited Ælfrie's *Anglo-Saxon Homily*, to prove that transubstantiation was not the doctrine of the ancient English church; the *Flores Historiarum*, as the work of an assumed Matthew of Westminster; the *Historia Major* of Matthew Paris, the *Historia Anglicana* of Walsingham, Asser's *Gesta Ælfredi*, and the *Itinerarium* of Giraldus Cambrensis. The *De Excidio Britannia* of Gildas was edited under his eye by Joselin. He was an indefatigable collector of books, and the greater part of the treasures he had amassed he bequeathed to Corpus Christi College. This collection Fuller called 'the sun of English antiquity before it was eclipsed by that of Sir Robert Cotton.' Parker established a scriptorium at Lambeth, where he maintained printers, transcribers, engravers. His original writings are inconsiderable, the chief being a Latin treatise, *De Antiquitate Britannicae Ecclesiae et Privilegiis Ecclesiae Cantuariensis* (1572). His letters fill a volume (1853) in the publications of the Parker Society, a fitting memorial of the book-loving archbishop. The Society published from 1841 till its dissolution in 1853 as many as fifty-three volumes of the works of Ridley, Bull, Grindal, Hooper, Cranmer, Coverdale, Latimer, Jewel, Tyndale, Bullinger, Whitgift, Rogers, and other fathers of the English Reformation. For Parker's life, see the *Life and Acts* by Strype (3 vols. Oxford, 1824); also Hook's *Lives of the Archbishops of Canterbury*, vol. ix. (1872).

Parker, THEODORE, a great American preacher, was born at Lexington, Massachusetts, August 24, 1810. His grandfather held a command at Lexington, his father was an intelligent Unitarian farmer and wheelwright. He graduated at the Divinity School at Harvard in 1836, and settled the year after as Unitarian minister at West Roxbury, now a part of Boston. The naturalistic or rationalistic views which separated him from the more conservative portion of the Unitarians first attracted wide notice in an ordination sermon on *The Transient and Permanent in Christianity* (1841). The contest which arose on the anti-supernaturalism of this discourse led him to further develop his theological views in five Boston lectures, published under the title of *A Discourse of Matters pertaining to Religion* (1841), which was followed by *Sermons for the Times*. Failing health induced him to make an extended tour in Europe. In 1844 he returned to America, and for the remainder of his life preached to a

congregation of three thousand at the Melodeon and Music Hall, besides incessantly writing for the press on social and theological questions. He lectured also throughout the States, and plunged with characteristic enthusiasm into the anti-slavery agitation. In the midst of his work he was attacked in 1859 with bleeding from the lungs, and made a voyage to Mexico, whence he sailed to Italy, only to die at Florence, May 10, 1860. His lectures, sermons, and miscellaneous writings have been collected and published in America and England, and reveal vast learning, keen spiritual insight, with great force of argument and felicity of illustration. Yet the thought is neither clearly defined, profound, nor always self-consistent, while the form is usually far inferior to the content.

The English edition of his works was edited by Frances P. Cobbe (12 vols. 1863 *et seq.*). There are Lives by Weiss (2 vols. Boston, 1864), Frothingham (New York, 1874), Dean (Lond. 1877), and Frances E. Cooke (3d ed. Boston, 1889). See also vol. i. of Martineau's *Essays, Reviews, and Addresses* (1890).

Parkersburg, capital of Wood county, West Virginia, on the Ohio River (here crossed by a railway bridge $1\frac{1}{2}$ mile long), at the mouth of the Little Kanawha, 195 miles by rail E. by N. of Cincinnati. The city has a large trade in petroleum, and contains five great oil-refineries, besides chemical works, lumber-mills, and manufactories of furniture, barrels, &c. Pop. (1890) 8408.

Parkes, SIR HENRY, K. C. M. G., an Australian statesman, was born the son of a yeoman at Stoneleigh, Warwickshire. In 1815, emigrated to New South Wales in 1839, and at Sydney became eminent as a journalist, editing *The Empire* from 1849 to 1856. A member of the colonial parliament in 1854, he held various government offices and became prime-minister in 1872. He has since been several times head of the ministry, and has been identified with the promotion of free trade. He was the representative of New South Wales at the Colonial conference in London in 1887, and in 1891 was president of the council for arranging a federal union of the Australian colonies.

Parkesine. See CELLULOID.

Parkhurst, JOHN, an English biblical scholar, was born at Cateby in Northamptonshire in June 1728. He was educated at Rugby and at Clare Hall, Cambridge, and took orders, but soon after retired to his estate at Epsom to give himself to study. Here he died, March 21, 1797. In 1762 appeared his principal work, *A Hebrew and English Lexicon, without Points*, a very creditable performance for its time, and long a standard work, although disfigured by its fanciful etymologies. Of course it is now entirely superseded. Parkhurst also wrote a treatise (1787) against Dr Priestley, to prove the divinity and pre-existence of Jesus Christ.

Parkman, FRANCIS, historian, was born in Boston, Massachusetts, 16th September 1823, graduated at Harvard in 1844, next studied law for two years, then travelled in Europe, and returned to explore the Rocky Mountains. The hardships he endured among the Dakota Indians seriously injured his health, yet in spite of this and defective sight Parkman has worked his way to recognition as a historical writer on the period of rise and fall of the French dominion in America. He has paid many visits to France to examine archives. His books are *The California and Oregon Trail* (1849), *The Conspiracy of Pontiac* (1851), *Pioneers of France in the New World* (1865), *The Book of Roses* (1866), *Jesuits in North America* (1867), *Discovery of the Great West* (1869), *The Old Régime in Canada* (1874), *Count Frontenac*

and *New France under Louis XIV.* (1877), and *Montcalm and Wolfe* (1884).

Parlement, the name applied in France, down to the Revolution, to certain superior and final courts of judicature, in which also the edicts of the king were registered before they became laws. Of these the chief was that of Paris, but there were no fewer than twelve provincial parlements, at Toulouse, Grenoble, Bordeaux, Dijon, Pau, Metz, Besançon, Douai, Rouen, Aix, Rennes, and Nancy. These, though not actually connected with that of Paris, invariably made common cause with it in its struggles with the royal power. The parlement of Paris dated from the 14th century, and already consisted of three chambers, the Grand Chambre, the Chambre des Enquêtes, and the Chambre des Requêtes. By 1344 it had grown in numbers and power, and consisted of 3 presidents and 78 counsellors, of whom 44 were ecclesiastics and 34 laymen. In 1467 Louis XI. made the counsellors irremovable. Its influence grew during the 16th century, and it now began to find courage to deliberate on the royal edicts as well as merely register them, which the king could always force them to do by coming in person and holding a 'lit de justice' (see BED OF JUSTICE). Neither Richelieu nor Louis XIV. permitted such discussion of their edicts, and both the Regent Orleans and Louis XV. followed their policy. The latter exiled the members from Paris in 1753 for their interference in the struggle between the Jansenists and the Jesuits, and in 1770, on the advice of Maupeou, abolished the old parlement altogether and established the Parlement Maupeou. Louis XVI., however, recalled the former counsellors. These in the last days of their existence were grouped as follows: The Grand Chambre, with 10 presidents and 37 counsellors, of whom 12 were clerics; the three Chambres des Enquêtes, each formed by 2 presidents and 23 counsellors; and the Chambre des Requêtes, in which sat 2 presidents and 13 counsellors.

Parley, PETER. See GOODRICH.

Parliament (Low Lat. *parliamentum* or *parlamentum*; Fr. *parlement*, from *parler*, 'to talk'), a meeting for conference and discussion (see PARLEMENT). In England the name of parliament has been given since the 13th century to the Great Council of the realm—the national assembly which succeeded to the powers exercised by the Witenagemote in Anglo-Saxon times. Under the influence of feudal ideas the Great Council became the high court of parliament. As the manor had its courts in which the lord met with his tenants, so the kingdom had its high court, in which the king met with the different estates or orders of his subjects, and conferred with them as to the enforcement of the good customs of the realm. At first the king claimed to exercise a measure of arbitrary discretion in issuing his writs of summons to parliament; but before the end of the 13th century it was settled and clearly understood that parliament should always consist of duly qualified representatives of the three estates of the realm—the Clergy, the Lords, and the Commons. The notion that the three estates are King or Queen, Lords, and Commons is a modern misconception.

The Three Estates—The Clergy.—The clergy were represented by the Lords Spiritual, the bishops, who sat among the Lords by virtue of their office. At one time proctors representing the lesser clergy sat among the Commons; but the clergy gave up this right in order to manage their own affairs in Convocation (q.v.). When Convocation gave up its right of taxation clergymen were permitted to vote in the election of members of the House of Commons. It would hardly be correct to say that the

clergy still form a separate estate; but the Lords Spiritual still sit in the Upper House. The Archbishops of Canterbury and York, and the Bishops of London, Durham, and Winchester are always summoned to parliament; the other bishops are also summoned, but the junior members of the episcopal bench are excluded by the acts for the creation of new bishoprics, in which it is provided that the number of Lords Spiritual is not to be increased beyond the number as it stood in 1846, when the see of Manchester was founded. The Lords Spiritual do not vote as a separate order; in other words, a bill may pass in the House of Lords though all the bishops vote against it.

The Lords Temporal.—The lords or greater barons were originally those who held lands and honours of the king by the more dignified kinds of feudal service. They were barons by tenure, and as such entitled to receive the king's writ; among themselves they were peers or equals. In course of time the writ became the evidence of title to a peerage; but since the 15th century peers have always been created by a patent from the crown, specifying the title by which the new peer is to be known, and the heirs to whom his dignity is to descend. The titles now in use are duke, marquis, earl, viscount, and baron (on which see separate articles); a peer is named as being of a particular place, but it is no longer necessary that he should have any land or feudal rights in the place named. In other words, our aristocracy is no longer a close feudal aristocracy; it owes its existence to the crown, and the crown may increase the number of peers at pleasure. This is a very important rule, for the right to create new peers enables the crown—i.e. the ministers governing in the name of the crown, and enjoying the confidence of the House of Commons—to overcome the resistance of the House of Lords. Of late years the mere threat to create new peers has been found sufficient, as may be seen on referring to the history of the Reform Act of 1832. The dignity of peerage was always a hereditary dignity; the blood of the holder was ennobled. But the sons of a peer, though they bear courtesy titles and are nominally ennobled, are commoners for all legal and political purposes. This again is a most important rule, because it prevents the nobility from becoming a closely organised caste. It seems that the crown could always create a man a peer for his life; but it was resolved in the case of Lord Wensleydale, in 1856, that a life peerage, even if followed up by a writ of summons to parliament, would not entitle the holder to sit in the House of Lords. Since the Wensleydale case the Lords of Appeal, appointed to take part in the judicial business of the House, have been made life peers by statute. In 1830 there were 401 peers on the roll of the House of Lords; in 1890, 551, 12 being minors. Of these peerages 193, or rather more than one-third, have been created since the beginning of the 19th century.

In ancient times the prerogative right to create peers was used but sparingly; there were only some 50 or 60 Lords Temporal in the parliaments of the 15th and 16th centuries. The number of Lords Spiritual was reduced by the removal of abbots and priors at the Reformation to 26, and has not since been increased. Four sat as representatives of the Irish Church from 1800 down to its disestablishment in 1869. In conferring peerages the Stuart kings were more generous, or more lax than their predecessors. At the Revolution of 1688 the number stood at about 150. On the accession of George I. the leaders of the House of Lords proposed to restrain the crown from adding to the then existing number of 178 peerages; but this scheme was vehemently opposed

in the House of Commons, and finally rejected. During the reign of George III. peers were created very freely. It was the avowed policy of the younger Pitt to fill the House of Lords with the wealthiest traders and landowners, and so to break down the family and personal factions into which a small aristocratic assembly tends to divide itself. With this object he conferred peerages so lavishly that the number created by George III. was 388.

In 1399 the Commons formally admitted 'that the judgments of parliament belong to the Lords and not to the Commons.' The House of Lords is a court of final appeal for all parts of the United Kingdom; it exercises original jurisdiction in peerage cases, in trials of peers for treason or felony, and on Impeachments (q.v.) by the Commons. When the House is sitting judicially only those members who hold or have held high judicial office take part in the proceedings. Lay peers formerly took part and voted on appeals; but this practice was justly regarded as a scandal. In 1844 some lay peers announced their intention to vote in the case of the Queen v. Daniel O'Connell, but they were persuaded to retire, and the case was decided by the legal members of the House. In its legislative capacity the House may deal with any matter affecting the public interest, and it claims the right to initiate bills which directly affect its own rights and privileges. By a convention of long standing, the Lords respect the right of the Commons to initiate money bills; they may accept or reject a money bill, but they do not amend it in detail. Any member of the House may introduce a bill, and ask that it may be read a first time; the 'reading' is of a formal character—the bill is laid on the table, and the title is read out by the clerk. If the House consents to read the bill a second time it accepts the general principle of the measure; the bill is then referred to a committee of the whole House, or to a select committee, to be amended in detail; it may then be reported to the House and read a third time and passed. If the bill is afterwards passed, or has already been passed by the Commons, it only requires the royal assent to become an act of parliament. This assent is given by the sovereign in person, or by commissioners representing the sovereign; the Lords are present in their places; the Commons, headed by their Speaker, attend at the bar of the Lords; the clerk of parliaments utters the Norman-French formula, 'Le Roy (or La Reine) le veut.' In the case of a money bill the royal assent is coupled with an expression of thanks for the 'benevolence' of parliament. The clerk endorses on the bill the date of the royal assent which turns it into an act. If the sovereign were to refuse assent the form would be 'Le Roy (or La Reine) s'avisera'—the King (or Queen) will think about it. But since the cabinet council became the chief power in the state this form of refusal has never been heard. Ministers take the lead in the business of legislation; they obtain the assent of the sovereign on the one hand, and of parliament on the other; all open conflict of powers is avoided. Queen Anne refused her assent to a Scotch Militia Bill; but since that time the royal assent has been given to every bill which passed the two Houses. Bills which await the royal assent are usually deposited in the House of Lords for that purpose; but a money bill, after passing the Lords, is returned to the Speaker of the Commons, and is brought by him to the bar of the Lords to receive the royal assent.

Precedence and Privileges.—Members of the House of Lords were formerly required to sit according to their precedence, but this rule is no longer observed. The bishops sit to the right of the woolsack; on the same side is the bench usually

occupied by ministers. Supporters of the government sit behind their leaders, members of the opposition on the other side of the House, and independent members on the cross benches in front of the table. Whether it is sitting as a legislative or a judicial body, the House of Lords possesses all privileges necessary to the safe and dignified conduct of business. Its members are free from arrest on civil process in coming, going, or returning. They are free to speak their minds without being liable to action or indictment. They have access to the crown to explain their proceedings, and the crown should put the best construction on what they do. It is a breach of privilege to reflect on the honour of the House, or on the parliamentary conduct of its members. It is technically a breach of privilege to report its proceedings; but regular arrangements are now made for the admission of reporters. It was formerly doubtful how far the printers of the House were protected, but now, under an Act of 1840, the printers of parliamentary papers, if sued or prosecuted, may obtain a stay of proceedings on producing a certificate that such papers were printed by order. The House of Lords declares its own privileges; but in doing so it is bound by the law; it cannot create a new privilege by mere declaration. Persons guilty of breach of privilege may be attached and brought in custody, censured, fined, or imprisoned for a time certain or during pleasure. The privilege of the House may be used to protect the House and its committees, and all persons having lawful business before them, together with their counsel, solicitors, and witnesses.

Officers.—The chief officer of the House of Lords is the Chancellor, or Keeper of the Great Seal, who acts as speaker for formal purposes; he does not keep order; the Lords keep their own order. It is not even necessary that he should be a lord of parliament, and he sits on the woolsack, which is supposed to be outside the House. Deputy-speakers are appointed when necessary; and there is a salaried Chairman of Committees who exercises considerable powers, especially in regard to private bills. The Clerk of Parliaments is appointed by the crown; and the Gentleman Usher of the Black Rod is one of the Queen's ushers, whom she permits to act as the messenger and executive officer of the Lords. The judges and law-officers rank as assistants of the House; they are summoned to attend in parliament, and they are present on occasions of state; the judges also come in and sit together on the woolsack when the Lords desire to take their opinions on a point of law. Formal messages to the Commons are conveyed by the Usher of the Black Rod. Judges and Masters in Chancery were formerly employed for the same purpose, but the Commons came to treat these ceremonious messages with levity, and messages now pass from one House to another by the hands of their respective clerks, except on certain important occasions, such as the opening of parliament, &c. Formerly, when the two Houses differed, a formal conference was held in the Painted Chamber, the Lords sitting with their hats on, the Commons standing and uncovered; but the modern practice of party government renders these conferences unnecessary.

The Commons.—The Commons, or 'communitas regni,' included originally three classes of persons. First, the proctors of the lesser clergy, who disappeared at an early date. Secondly, the knights of the shire, who were chosen by the lesser barons and the general body of freeholders. These free tenants held their land by honourable tenures, but they could not bear the expense of attendance in parliament. As early as the time of King John they were represented by delegates; and Simon de Montfort gave effect to the same principle when

he ordered two knights to be sent to parliament from each shire. Thirdly, there were burgesses and citizens, representing the self-governing towns of the kingdom. The burgesses also found it hard to bear the expense of attending parliament; they usually received an allowance for doing so; and some legal authorities have held that a member may still recover his 'wages' if he chooses to sue for them. No member of parliament now receives any pecuniary allowance. Payment of members is often advocated on the ground that the labouring population ought to be represented by men of their own class; it is resisted on the ground that paid members would be officials or delegates, not free representatives of the general body of citizens.

Happily for the cause of popular government, the knights and burgesses were soon welded together in one body; there has never been any legal difference between county members and borough members. Early in the history of parliament (the date cannot be exactly determined) the Commons retired to consider their own affairs in a separate chamber; one of their number presided, and acted as Speaker in communicating to the Lords the opinions of the third estate; and thus the Commons came to be organised as a separate House. The Lords remained in the old parliament chamber, and there the king continued to meet with the three estates; his throne was set in the House of Lords, and he never went into the House of Commons. Charles I. was therefore acting contrary to usage when he went in person to arrest the seven members. From about 1548 the Commons met in a room which had been known as St Stephen's Chapel, and the House is still occasionally spoken of as St Stephen's. Within the House all members are equal; but the bench immediately to the right of the chair is reserved for privy-councillors, and is now always occupied by ministers having seats in the House: their supporters sit behind them, and the members of the opposition sit to the left of the chair. Like the members of the other House, the Commons enjoy privilege of parliament; they are free from arrest on civil process in attending the House, and in coming or returning; but no person is privileged against arrest for crime or contempt of court. In the days when arrest for debt was common the privilege claimed by members of parliament, and even by their servants, was sometimes used to defeat creditors; but now an action or a bankruptcy petition is in no way impeded by privilege. A member of either House who becomes bankrupt is not permitted to sit or vote. Freedom of speech is enjoyed by the Commons as by the Lords; and they may claim, as a House, free access to the sovereign. The Commons may deal with offenders against their privileges by directing a prosecution; they do not claim the right to impose a fine, or to imprison for a time certain, but they may commit a person to prison during pleasure; persons so imprisoned may not be detained after the end of the session. The House declares its own privileges, but it cannot create a new privilege by mere declaration. In the famous case of *Stockdale v. Hansard* the House assumed authority to protect its printer against an action for libel, but the courts disregarded this resolution, and the controversy was finally settled by the passing of the Act of 1840 which has already been cited. A question of privilege will be taken up without notice at any moment; but it should be observed that a member has no privilege except when he is performing his parliamentary duty. If, for instance, a member is arrested for a crime committed out of doors, no question of privilege arises. We have seen that the Commons claim no general judicial authority, but they have claimed to deal judicially

with cases of privilege, and with questions relating to the election and conduct of their members. Election petitions used to be tried by committees of the House, but this practice led to great abuses, and in 1868 these petitions were remitted to the judges for trial. The House may exclude, suspend, or expel a member for misbehaviour; but it was settled in the case of John Wilkes (q.v.) that expulsion creates no disqualification; the person expelled may be re-elected. Burke and other high authorities attach great importance to this rule of the constitution. If the House could disqualify a member for re-election, the majority might be tempted to strengthen itself by expelling the leaders of the minority. In 1711 Sir Robert (then Mr) Walpole was expelled the House, and there is reason to believe that the vote in his case was decided by considerations of party, and not by his guilt or innocence of the charges made against him.

As representing the whole community, and not merely a limited order, the Commons have long been accustomed to take the lead in the financial and legislative business of parliament. Since the Great Charter the crown has frequently admitted that taxes are not to be levied without consent of parliament; and in the reign of Richard II., if not earlier, the Commons laid claim to the 'power of the purse.' It is now established beyond doubt that the Commons have an exclusive right to vote supplies of money, and to prescribe the ways and means by which money may be raised. This right is respected by the Lords; the last conflict between the Houses occurred in connection with the repeal of the paper duty in 1860. Estimates of public expenditure are laid before the Commons by ministers, and considered in committee of supply. This is a committee of the whole House; the Speaker leaves the chair when the committee begins; the Mace (q.v.) is taken from the table; the Chairman of Committees takes his seat at the table; and the discussion which follows is of an informal character, members being allowed to speak more than once to the same question. When some of the necessary votes have been taken in supply the House resolves itself, in like manner, into a committee of ways and means. The resolutions adopted in committee are embodied in bills, which are sent up for the assent of the Lords. At the close of the financial year (i.e. about the end of March) the Chancellor of the Exchequer, in committee of the whole House, opens his Budget (q.v.) of expenditure and revenue for the coming year. Legislative business is conducted with the same forms as in the Lords; but a member must ask leave of the House to introduce a bill. If a bill is read a second time it is considered in detail by a committee of the whole House, or by a select committee. A committee always reports its proceedings to the House, the Speaker resuming the chair for that purpose. Besides performing these financial and legislative duties, the House of Commons acts as a 'grand inquest' to inquire into all matters of public concern. It is specially bound to watch the conduct of ministers, and to inform the sovereign whether they possess the confidence of the nation or not. In other words, the support of the Commons is necessary to the existence of a ministry, while a ministry may hold power though its supporters are in a minority in the Lords. Ministers take the lead in all important business; and party discipline tends to reduce the individual private member to comparative insignificance.

Union with Scotland and Ireland—Parliamentary Reform—Democracy.—The functions of parliament have been rendered more important and difficult by the political changes of the last 200 years. In the first place there is now only one legislature for the

United Kingdom. Down to 1707 Scotland had an independent parliament; the three estates of that kingdom sat together in one house, and the conduct of business was for the most part left to a smaller body called Lords of the Articles. At the Union the Scottish parliament ceased to exist; it was agreed that sixteen Scottish peers (elected by an assembly of peers at Holyrood, at the opening of a new parliament) should sit in the House of Lords, and not less than forty-five Scottish members in the House of Commons. The Irish parliament was an assembly of a more or less provincial character, sitting in two houses. Its legislative independence was conceded, under pressure, in 1782, but it never obtained effective control over the executive (see GRATTAN). By the Act of Union the Irish parliament was taken away; it was agreed that twenty-eight Irish peers (elected for life) should sit in the House of Lords, and 100 Irish members in the House of Commons. Thus the English parliament became the parliament of the United Kingdom. By the acts extending toleration to Roman Catholics (1829), Jews (1858), and Secularists—under the Oaths (q.v.) Act of 1888—new elements have been introduced into parliamentary life, and new questions have arisen for legislative treatment. Successive Reform acts have widened the democratic basis of the House of Commons: the Act of 1832 gave power into the hands of the middle classes; the Acts of 1867 and 1884, by admitting all householders and £10 lodgers to the franchise, have given a preponderance of voting power to the working-classes. One result of these successive changes is that the Commons are now 670 in number; they are, in fact, much too numerous for a deliberative assembly. The colonies and dependencies have no direct representation in either House; but questions of imperial policy occupy no small share of the time of parliament. With the advance of democracy, the sphere of legislation has been extended; large schemes for promoting education and sanitary reform, for regulating mines, factories, and shipping, and for the creation of new executive departments and local authorities are brought forward by all political parties. Each party makes its power felt by pushing its own measures and by dilatory resistance to the measures of its opponents; obstruction has been reduced to an art; the labours of those who lead the House of Commons have become intolerably heavy, and the old rules of debate are found unequal to the strain of political conflict. In 1882 the House adopted new rules of procedure, and these rules were further amended in 1887. A motion for the closure of a debate may now be put at any moment, with the assent of the Speaker or Chairman. But a question for the closure of debate is not decided in the affirmative unless it appears that the motion is supported by more than 200 members, or is opposed by less than 40 and supported by more than 100 members. Dilatory motions for adjournment have been checked; tedious and irrelevant speakers may now be stopped by the chair; a member 'named' to the House as disregarding the authority of the chair may be suspended for a time from his service.

Officers.—The chief officer of the House of Commons is the Speaker, who is chosen by the members from among their own number, at the opening of a new parliament. The Speaker-elect presents himself at the bar of the Lords for the approval of the crown, which is given in a customary form of words by the Lord Chancellor. The Speaker then lays claim to the ancient privileges of the Commons: on returning to his own House he takes the oath before the other members. Inducted with these forms, the Speaker becomes the president and spokesman of the House, with authority

to keep order. He refers all questions of importance to the House; but his own position is one of great influence and dignity; he is the First Commoner in the kingdom, and takes precedence as such. The Chairman of Committees presides in committee of the whole House; he is also empowered to act as Deputy-speaker. The Assistant Clerk of Parliaments acts as clerk of the House. There are two other clerks; their chief duty is to keep the Journals, which are accepted by all other authorities as evidence of what is done by the House. The Serjeant-at-arms is the executive officer of the Commons.

Summoning Parliament.—When the sovereign is advised to summon a new parliament notice of that intention is given by proclamation. A writ of summons is sent to each lord of parliament; the Scottish peers elect the representative peers. A writ is also sent to the returning-officer of each constituency, commanding him to hold an election, and to return the name of the person elected. In counties the sheriff acts as returning-officer; in Scotland he acts also for burghs within his jurisdiction; in English boroughs this duty is commonly performed by the mayor. The lawful charges incurred by the returning-officer are borne by the candidates, an arrangement which is regarded with disfavour by those who wish to make it easy for poor men to enter parliament.

Places represented in Parliament.—The places represented in the House of Commons are counties and county divisions, boroughs and wards of boroughs, and universities. By the plan of redistribution adopted in 1884-85 the more populous counties and boroughs are divided into districts, each of which elects a single member. The plan is fairly convenient, and will probably hold its own in spite of the advocates of proportional representation. The seats allotted to the universities have been the cause of some controversy. In old times a university was a kind of borough within a borough; Oxford and Cambridge obtained at an early date the privilege of sending burgesses to parliament; Trinity College, Dublin, enjoyed a similar privilege, and now sends two members to Westminster; London University now elects one member, and the four Scottish universities elect two. The electors in all these cases are the graduate members of the university. Of course university men, if qualified, vote also for the places where they reside or have property, and this double representation is objected to as being inconsistent with democratic principles. There is also a considerable body of opinion hostile to all double qualifications; 'one man one vote' has been for some time a popular cry.

Electors.—The voters entitled to take part in the election are those whose names are on the register. Registration was introduced after the Reform Act of 1832; and the present law affords much more satisfactory means of proving and testing claims to vote than the rough and ready methods formerly in use. Lists of voters are made out by local authorities, and carefully revised, in England by barristers appointed for the purpose, in Scotland by the sheriff or his substitute in a registration court. The persons entitled to be placed on the register are male persons over twenty-one, not being peers, not disqualified by alienage, office, or employment, unsoundness of mind, conviction for crime or corrupt practices, or receipt of parochial relief, and possessing any of the property qualifications required by law. Before 1832 county members were elected in England by the freeholders assembled in the county court; an act of Henry VI. restricted the right of voting to those whose tenements were of the yearly value of forty shillings; in some boroughs the right of election belonged to a limited number

of persons having freeholds or burgage tenements within the boroughs; in others the inhabitants paying scot and lot voted; in others, again, the right was restricted to members or officers of the corporation. In Scotland the county qualification was a forty-shilling land of old extent, or land not of old extent rated in valuation books at £400; in Edinburgh the election was by the town-council; the member for each group of royal burghs was chosen by delegates appointed by the town-councils. In Galt's novel, *The Provost*, there is a graphic and truthful description of a burgh election under the old system. The Irish borough and county franchises were modelled on the English system; on the passing of the Roman Catholic Emancipation Act in 1829 it was thought prudent to disfranchise freeholders under £10 a year. These old franchises have been in part destroyed and in part preserved by successive acts of reform. The statute law on the subject is voluminous and complicated, and the work of simplification is beset with difficulties; the opposition is always ready to suspect the party in power of what the Americans call 'gerrymandering'—i.e. of readjusting the electorate to suit its own interests.

The qualifications which now entitle a person to be registered and to vote are classified by Sir W. Anson as follows: (1) *Property.*—In England freehold of inheritance of forty shillings yearly value, freehold for life of £5 yearly value, copyhold of £5 yearly value, leasehold of £5 yearly value held for a term of sixty years or more, leasehold of £50 yearly value, if held for a term of twenty years or more, will qualify a person to vote in counties, and in towns which rank as counties. In Scotland land or heritage of £5 yearly value, leasehold of £10 yearly value held for life or for fifty-seven years or more, leasehold of £50 yearly value held for nineteen years or more will qualify for the county franchise. In Ireland freehold of £5 net annual value, rent charge or leasehold for life of £20 annual value, leasehold of £10 value held for sixty years or more, leasehold of £20 value held for fourteen years or more will qualify for the county franchise. Special rules have been made to prevent the multiplication of small freeholds for political purposes (the process popularly known as 'Faggot-voting,' q.v.). (2) *Occupation.*—The occupier of land or tenements of the yearly value of £10 is qualified to vote in any part of the United Kingdom, but the mode of ascertaining the value varies. In English and Scotch boroughs residence in or within 7 miles of the borough is required; and in all parts of the United Kingdom this franchise is made to depend on payment of rates. (3) *Residence.*—The inhabitant occupier of a dwelling-house, or of any part of a house occupied as a separate dwelling, is qualified; throughout the United Kingdom this franchise is made dependent on payment of rates. Lodgers occupying rooms of the yearly value (unfurnished) of £10 are also qualified. Certain rights of resident burgesses and freemen in English boroughs were preserved by the Act of 1832, and the liverymen of the City Companies retain the right to vote in the City of London.

Candidates—Conduct of the Election—Election Petitions.—On receiving the writ for an election the returning-officer fixes a day to receive the names of candidates. Any male British subject of full age, not disqualified by peerage, office, conviction, &c., may become a candidate. A candidate is required to have an agent for election expenses, and in promoting his candidature he is bound to see that no breach of the law is committed, and that the total expenses are kept within the limits prescribed by the Corrupt Practices Act, 1883 (see BRIBERY). If more candidates come forward than

there are seats to be filled, a day is fixed for taking a poll of the electors; rooms or booths are fitted up for that purpose; each polling-place is supplied with a ballot-box, voting-papers, &c., and presided over by the returning-officer or one of his deputies. The elector votes by placing a cross opposite the name of the candidate of his choice; his paper is folded up by himself and dropped into the box; elaborate rules are made by the Ballot Act, 1872, to protect the secrecy of the vote (see *BALLOT*). Any material infraction of the law in conducting an election may be made the ground of a petition; the petitioners are required to find security for the costs: the petition is tried by two judges, who decide such questions of law and fact as may be raised, determine whether the person petitioned against has been duly elected or not, and report to the Speaker the result of their inquiry. If there is reason to believe that corrupt practices have extensively prevailed, commissioners may be appointed to make inquiry and report, and persons guilty of criminal offences may be prosecuted. The foregoing rules apply to the conduct of a general election, and also to the conduct of an election to fill a vacancy in the House of Commons caused by death, expulsion, or acceptance of office under the crown. The law does not permit a member of parliament to resign; if a member wishes to retire he applies to the Treasury for the stewardship of the Chiltern Hundreds (q.v.), and the acceptance of this has the effect of vacating his seat. When a member accepts high political office, as a general rule he vacates his seat, and must present himself for re-election.

Meeting of Parliament—Acts of Parliament.—When the Lords and Commons assemble at Westminster the Commons are directed to choose a Speaker. This having been done, and the members of both Houses having taken the oath of allegiance, the causes for which parliament has been called together are declared in the King's or Queen's Speech, which is read by the sovereign in person, or by the Lord Chancellor in the sovereign's presence, or by one of the lords commissioners who represent the sovereign in absence. The two Houses are free to take up matters not laid before them by the crown; business is usually begun in each House by reading a bill *pro forma*, in order to assert the right of free deliberation. Two members are chosen in each House by ministers to move and second an address in answer to the royal speech; in the Commons this motion gives rise to an aimless and discursive debate, in which the whole policy of the government is attacked by the opposition. Such are the forms with which the first session of a new parliament is begun. Each House may adjourn at its own discretion from day to day and for the customary holidays. The session comes to an end when parliament is prorogued by the crown: prorogation puts an end to all sessional orders and to all pending business, except impeachments, writs of error, and appeals to the House of Lords. The public acts of parliament passed in a session form one statute, which is divided into chapters for convenience of reference. Thus, 'the 30 and 31 Vict. chap. 20' means the 20th chapter of the statute law made in a session which began in the 30th and continued into the 31st year of Queen Victoria's reign—in other words, the session of 1867. Copies of the statutes are engrossed for preservation among the rolls of parliament, and printed copies are sent to judges and magistrates; but no form of publication is required to give validity to a statute; all subjects are bound to take note of and obey the law. In applying the rules of a statute the courts are guided by the intention expressed in the act itself; they will not look at the arguments or assurances

addressed to parliament in the course of debate. An act comes into force as soon as it receives the royal assent, unless some other time has been indicated in the act. It is a rule that no bill may be introduced twice in the same session; it has sometimes been found necessary to prorogue parliament in order that a rejected bill may be brought in again without delay.

Divisions—Committees.—A division is taken in either House by the voices of those present, the Lords crying 'Content' or 'Not content,' the Commons 'Aye' or 'No.' If the Speaker's decision as to the result of the vote is challenged, members pass out into the lobbies, and are 'told' or counted by members appointed for that purpose. In case the numbers are equal, in the Lords the question is decided in the negative; in the Commons the Speaker gives a casting vote. Matters which cannot conveniently be dealt with in the House are referred to a committee of the whole House, such as has been already described, or to a select committee. Witnesses may now be examined before committees of both Houses on oath. When a private bill is sent to a committee, the promoters and opponents attend with their counsel and agents; the inquiry partakes of a judicial character. The expense of proceedings before parliamentary committees is very great, and many proposals have been made to alter the existing system: a bill was before parliament in 1891 by which it was proposed to create a local tribunal to deal with Scotch private bills. In the House of Commons there were formerly four grand committees, for religion, for grievances, for courts of justice, and for trade. These four were discontinued in 1832; in 1882 two standing committees were appointed for the consideration of bills relating to law and courts of justice and to trade. These standing committees have done less to lighten the labours of the House than was at first expected; it is found that time may be wasted by reopening in the House questions which have been already discussed at length in the committee.

Prorogation and Dissolution.—When parliament has been prorogued it may be summoned to meet for another session; the new session is opened with a royal speech. When the government determines to 'go to the country'—i.e. to hold a general election, it is customary to put an end to the session by prorogation, and afterwards to issue a proclamation dissolving the parliament and to give directions for the issue of new writs of summons. Dissolution puts an end to the House of Commons for the time being; the members are no longer addressed by the title of M.P., and the Speaker becomes an ordinary commoner. The law directs that not more than three years shall elapse between the dissolution of a parliament and the calling of a new one; but, inasmuch as the Commons will not vote more than an annual supply of money, it is absolutely necessary that there should be at least one session of parliament in each year. No parliament may endure for more than seven years from the time when it is first summoned to meet. Triennial parliaments were established by a law of 1641; in the same year the Long Parliament got the king to agree to a bill depriving him of the right to dissolve that parliament without its own consent; the Triennial Act was repealed after the restoration of Charles II., and re-enacted in 1694. The period of seven years was fixed, instead of three years, by the Septennial Act, passed on the accession of George I. (1714), at a time when the government desired to avoid the changes of popular opinion produced by frequent general elections. The act is praised by some critics and attacked by others, because it makes members more independent of the

electors than they would be if they were constantly looking forward to an election.

'Omnipotence' of Parliament.—In foreign countries and in the British colonies the legislature is a limited body, which exercises the powers conferred upon it by a written constitution; its acts are void if they exceed its powers. An act of the congress of the United States, for example, may be set aside by a court of law if it is beyond the constitutional competence of congress. No British court can set aside an act of parliament on any such ground, for parliament defines its own powers and is not bound by any written constitution. In the words of Sir Edward Coke, the power of parliament 'is so transcendent and absolute that it cannot be confined, either for causes or persons, within any bounds.' The other legislative authorities of the empire act within the limits laid down for them by parliament. If a colonial government, for instance, wishes to deal with some matter outside the colony, it must, as a general rule, obtain an act of parliament for the purpose; a colonial legislature has an authority which is plenary as to causes and persons, but limited as to territorial area. The Septennial Act, cited above, illustrates what is meant by the omnipotence of parliament. A House of Commons, elected for three years under the Act of 1694, concurred in prolonging its own mandate to a period of seven years; and its action was perfectly legal and constitutional. Whether we should gain or lose by bringing the powers of parliament within legal bounds, it is not easy to decide.

Petitions to Parliament.—Petitions may be addressed to either House of Parliament by British subjects and persons resident in the British dominions; a petition must be presented by a member of the House to which it is addressed, except petitions

from the corporation of London, which are presented by the sheriffs of London at the bar. The Lord Mayor of Dublin has also been allowed to present a petition, and the same privilege would probably be conceded to the Lord Provost of Edinburgh. It was formerly not unusual for the member presenting a petition to make a speech, but the standing orders of the Commons now forbid this to be done. There is a committee on public petitions which reports twice a week during the session.

Parliamentary Returns.—Each House may obtain information from the executive departments by asking for returns and papers. In dealing with a subordinate department, or a department created and regulated by statute, either House may order returns; if the department is that of a high officer of state, or if the matter inquired of concerns the sovereign's prerogative, it is usual to move a humble address, praying that the documents required may be furnished. Neither House will order a return regarding the proceedings of the other; but the members of one House have seldom any difficulty in obtaining papers printed for the use of the other. No return may be ordered from private persons and associations, unless under the provisions of an act of parliament. Confidential documents (e.g. cabinet memoranda, or opinions of the law officers of the crown) are never laid on the table in either House, unless for special reasons the government thinks it desirable.

Constituencies.—The following table shows the number of members sent to the House of Commons by constituencies of the United Kingdom; the names of the electoral divisions of a county or borough not being generally specified when they are all simply taken from the points of the compass, north, north-east, central, &c.

Parma, a town of Italy, formerly the capital of the duchy of Parma, is situated on the ancient Via Emilia, and on the river Parma, 12½ miles S. from the Po, and by rail 56 miles NW. of Bologna and 79 SE. of Milan. The town is surrounded by walls and has a citadel (1591); the streets are straight and wide. Of the sixty or more churches the chief is the cathedral (1059-74), built mostly in the Lombardo-Romanesque style, with frescoes by Correggio. Other notable edifices are the baptistery, one of the most splendid in Italy, begun in 1196 and completed in 1281; the church of Madonna della Steccata (1521-39), containing 'Moses breaking the Tables of the Law' and other paintings by Parmigiano, and the tombs of the Farnese dukes; the church of St John the Evangelist (1510), with frescoes by Correggio; the ducal palace, containing art-galleries (Correggio's works), a library (214,000 vols. and 4500 MSS., including many incunabula and rare works), the archives, &c.; and numerous other palaces, public and private. There are also a university (1599), with nearly fifty teachers and more than two hundred students, a music school, a museum of antiquities, &c. The principal industrial products are pianofortes, silks, cast-iron wares, woollens, earthenware, paper, soap, &c. There are cattle, corn, and silk markets. Pop. (1881) 44,492. Founded by the Etruscans, Parma became a Roman colony in 183 B.C. After the fall of the western empire it was known as Chrysopolis (Gold Town). A stout opponent of the emperors, it was besieged and taken by Frederick II. in 1245, and again invested, but without success, in 1248. It then belonged successively to the houses of Correggio, Este, Visconti, and in 1511 to the pope. —The province has an area of 1278 sq. m., and (1889) a pop. of 285,790.

Formerly Parma was the name of a sovereign duchy of Italy, lying between the Apennines and the Po, touching Sardinia (Piedmont) on the west and Modena on the east. It comprised the two duchies of Parma and Piacenza, and had an area of 2377 sq. m. (see geography under ITALY). The territories of the cities of Parma and Piacenza fell into the hands of the pope in 1511. Pope Paul III. of the house of Farnese (q.v.) incorporated them (1545) as a duchy for his natural son Pier-Luigi, the grandfather of the celebrated Alessandro Farnese, regent of the Low Countries. On the extinction of the male line of Farnese in 1731 the duchy passed to Don Carlos of Spain, but was transferred to Austria four years later. In 1748 it was restored, along with Gualtalla, to the Spanish Bourbons. In 1796 it was seized by the French, in 1802 incorporated with France, and in 1814 was granted to the ex-empress Maria Louisa. On her death in 1847 it passed to the Bourbon Duke of Lucca. From this time until the incorporation with the kingdom of Italy in 1860 the duchy was in a most unsettled condition: the people were strongly revolutionary in feeling, and desired a union with Sardinia; but the rulers were reactionary and, supported by Austria, successfully beat down all attempts at revolution until after the battle of Magenta, when the Austrian troops withdrew and the regent for the youthful duke fled.

Parmenides, a Greek philosopher of Elea (Velia), in Lucania, and in the opinion of the ancients the greatest member of the Eleatic School (q.v.), flourished about the middle of the 5th cen-

tury B.C. Nothing is known with certainty regarding his life, but Plato tells us he visited Athens in his old age together with his pupil Zeno, and conversed with Socrates, then quite a youth—an anachronism most probably intended to account for the influence which the philosophy of Parmenides undoubtedly exercised on that of Socrates and Plato themselves. Parmenides, like his master Xenophanes of Colophon, sometimes regarded as the first of the Eleatics, expounded his philosophy in verse—his only work being a didactic poem *On Nature*. The extant remains have been rendered into English hexameters by Thomas Davidson (*Journal of Speculative Philosophy*, St Louis, 1870), and paraphrased in English prose by W. L. Courtney (*Studies in Philosophy*, 1882). The leading design of this poem is to demonstrate the reality of Absolute Being, the non-existence of which Parmenides declares to be inconceivable, but the nature of which, on the other hand, he admits to be equally inconceivable, inasmuch as it is dissociated from every limitation under which man thinks. The permanent unity of the universe is thus the ultimate object of knowledge. Parmenides is not a theologian in speculation, seeking rather to identify his Absolute Being with *Thought* than with *Deity*.

The best edition of his fragments is in S. Karsten's *Philosophorum Græcorum Reliquia* (Amst. 1835). See also the histories of philosophy of Brandis, Erdmann, Schwegler, Ueberweg, and Zeller.

Parmigiano, or PARMIGIANINO, the nickname of GIROLAMO FRANCESCO MARIA MAZZOLA, painter of the Lombard school, and the most distinguished of those who followed the style of Correggio, was born at Parma, 11th January 1504. He began to paint when little more than fourteen years of age. In 1523 he went to Rome, and was favourably noticed and employed by Clement VII. When that city was stormed by the imperialists under Constable Bourbon in 1527 Parmigiano sat calmly at work on his picture of 'The Vision of St Jerome' (now in the National Gallery, London), and was protected from the soldiers who burst in upon him by their leader. After this event he left Rome for Bologna, where he painted various works, including a celebrated altarpiece, the 'Madonna and Child,' and returned to Parma in 1531. Having engaged to execute a series of frescoes in the church of S. Maria Steccata, and having got payment in advance, he delayed so long with the work that he was thrown into prison for breach of contract, and on being released fled to Casal Maggiore, in the territory of Cremona, where he died on 24th August 1540. His best-known picture is 'Cupid shaping a Bow'; he painted portraits too, as of Charles V., Amerigo Vespucci, and himself.

Parnahyba, a river of Brazil, rises in the Serra Mangabeiras, about 9° S. lat., and throughout its course (650 miles) forms the boundary between the states of Maranhão and Piauí. It enters the Atlantic by six mouths. The stream is swift, but navigable by boats for nearly 350 miles. On the east bank, 14 miles from its mouth, is the unhealthy town of Parnahyba, with a considerable trade. Pop. 8000. See also PARANÁ.

Parnassus, a mountain in Phocis, regarded by the ancient Greeks as the central point of the earth. On its southern slope lay Delphi (q.v.), the seat of the famous oracle, and the fountain of Castalia (q.v.). The highest peak (8036 feet) was the scene of the orgies of the worship of Dionysus (Bacchus); all the rest of the mountain was sacred to Apollo and the Muses, whence poets were said to 'climb Parnassus,' a phrase still thus employed.

Parnell, CHARLES STEWART, Irish politician, was born at Avondale, in County Wicklow, June

28, 1846. His father belonged to an old Cheshire family, which purchased an estate in Ireland under Charles II., and from which had sprung Thomas Parnell the poet and Sir Henry Brooke Parnell, created Baron Congleton in 1841. His great-grandfather was that Sir John Parnell who was long Chancellor of the Irish Exchequer, and an active supporter of Grattan in his struggle against the Union; his grandfather, William Parnell, sat for County Wicklow, and published in 1819 a foolish political novel, anything but Irish in sentiment; his mother, Delia Tudor Stewart, was daughter of Admiral Charles Stewart of the United States navy. He was educated at Yeovil and elsewhere in England under private masters, and was for some time a member of Magdalene College, Cambridge, but took no degree. In 1874 he became High Sheriff of County Wicklow; next year he contested County Dublin without success, but in April 1875 was returned as an avowed Home Ruler for County Meath. He attached himself to Joseph Biggar, the member for Cavan, who was the first to discover the value of deliberate obstruction in parliamentary tactics, and during 1877 and 1878 he gained great popularity in Ireland by his audacity in the use of the new engine. There were many scenes of violence and excitement, and the new horror of all-night sittings became familiar to the House of Commons. Throughout the struggle Parnell showed equal audacity and coolness, and acquired a masterly knowledge of parliamentary forms. Mr Butt, the Irish leader, disapproved of this development of the *active* or obstructive policy, but his influence quickly gave way before Parnell's, and in May 1879 he died. The year before Parnell had been elected president of the English Home Rule Association. He now threw himself with energy into agrarian agitation, gave it its watchword—"Keep a firm grip of your homesteads"—at Westport in June, and in October was elected president of the Irish National Land League, which had been founded by Michael Davitt. Mr Parnell next visited the United States to raise funds for the cause, was allowed like Lafayette and Kosuth to address congress itself, and carried home £70,000. At the general election of 1880 he was returned for the counties of Meath and Mayo and for the city of Cork, and chose to sit for the last. He was now formally elected chairman of the Irish parliamentary party by twenty-three votes over eighteen for Mr Shaw. Meantime the agrarian agitation grew, and in a speech at Ennis, September 19, 1880, he formulated the method of boycotting as an engine for punishing an unpopular individual. Mr Gladstone's government now came to the conclusion that the objects of the Land League were contrary to the law, and in December put Parnell and several other members of the executive on trial, but the jury finally failed to agree. Next session the government brought in a Coercion Bill, which Mr Parnell opposed vigorously. In the course of the struggle he was ejected from the House, after a stormy scene, together with thirty-four of his followers, February 3, 1881. Mr Gladstone next carried his famous Land Bill, but this Parnell refused to accept as a final settlement until the result of certain test cases before the new Land Court was seen. On the 13th October Mr Gladstone sent him to Kilmainham gaol, and there he lay till released on May 2, 1882, after some private negotiations with the government conducted through the medium of Captain O'Shea. Mr Forster resigned the Irish secretaryship in consequence of the release, and next followed the terrible tragedy of Phoenix Park, of which Parnell in his place in the House of Commons expressed his detestation. The Crimes Act was now hurried through parliament in spite of the strenuous oppo-

sition of the Irish party. Already the Land League had been proclaimed as an illegal association after the issue of the 'No Rent' manifesto, but early in 1884 the Nationalists succeeded in reviving it under the name of the National League, and Mr Parnell was elected its president. The year before the sum of £35,000, mostly raised in America, had been presented to him by his admirers. After an unsuccessful attempt to make terms with the Conservatives, in the course of which he had a famous interview with Lord Carnarvon, the viceroy, Parnell flung his vote—now eighty-six strong since the lowering of the franchise—into the Liberal scale, and so brought about the fall of the short-lived first Salisbury government. Mr Parnell nominated the greater number of Nationalist candidates for the Irish constituencies, and the firm hand with which he controlled his party was seen in the promptitude with which he crushed a revolt of Healy and Biggar against his nomination of Captain O'Shea for Galway.

Mr Gladstone's views on the question of Home Rule had by this time undergone a complete change, and accordingly he introduced a Home Rule Bill, which was defeated owing to the defection of a large number of Liberal members headed by Lord Hartington and Mr Chamberlain. The consequent appeal to the country (July 1886) gave Lord Salisbury a Unionist majority of over a hundred votes, and threw Parnell into a close alliance with Mr Gladstone and the portion of the Liberal party that adhered to him. It was at this period that the *Times* newspaper published its series of articles entitled 'Parnellism and Crime'—a tremendous indictment against the chief Nationalist leaders, the most startling point in which was a series of letters published in fac-simile, one, signed by Parnell, expressing approval of Mr Burke's murder. The public excitement occasioned led to the appointment of a Special Commission to inquire into the whole matter. After an elaborate trial (extending to 128 days, and closing November 22, 1889), the most sensational event in which was the breakdown under cross-examination, and the flight and suicide at Madrid, of Pigott, the wretched Irishman who had imposed upon the *Times* with forgeries, Mr Parnell was formally cleared of the charge of having been personally guilty of organising outrages, but his party were declared to have been guilty of incitements to intimidation, out of which had grown crimes which they had failed to denounce. Parnell now raised an action against the *Times*, which was quickly compromised by a payment of £5000. The 'uncrowned king' of Ireland had now reached the summit of his power—the height of the wave was marked by the presentation of the freedom of Edinburgh, July 30, 1889, and the banquet given him on his forty-fourth birthday. But his fall in public esteem was quickly to follow. A few months later his frequent mysterious absences from his parliamentary duties were explained by his appearance, or rather his non-appearance, as co-respondent in a disgraceful divorce case brought by Captain O'Shea against his wife. After formal evidence was led by the petitioner, the usual decree was granted with costs against Parnell (November 17, 1890). The Gladstonian party in England now demanded his retirement from the leadership of the cause, and Mr Gladstone informed the Irish members that they must make their choice between Parnell and himself. They met and reappointed him their chairman, expecting, as the majority explained later, that after this recognition of his past services he would voluntarily retire at least for a time. But they had not calculated upon the characteristic obstinacy of his nature, and quickly found that their leader had no mind to efface him-

self for his country's good. After some days of profitless and heated wrangling the majority ended the discussion by leaving the room and electing Justin M'Carthy as their chairman. Parnell, with the shattered remnants of his party, now carried the warfare into Ireland; but his condemnation by the Church and the emphatic defeat of his nominees at by-elections foretold the complete collapse of his party at the general election of 1892, when seventy-two Anti-Parnellites were returned as against but nine who claimed his name and the succession to his policy. For the great discredited and discredited leader had died suddenly at Brighton, 6th October 1891, but five months after his marriage to Mrs O'Shea. Parnell's commanding personality might have made defeat less disastrous, but could hardly have prevailed against the strong conviction forced on Nationalists and English Home Rulers alike, that he had fatally confused personal ambition with patriotism.

See T. P. O'Connor's *Parnell Movement* (1896), and the *Life* (1891); also Justin H. M'Carthy, *England under Gladstone* (1884).

Parnell, THOMAS, a minor Queen Anne poet, born in Dublin in 1679, son of a commonwealth's man who at the Restoration left Congleton in Cheshire for Ireland. He had his education at Trinity College, took orders, and in 1705 received the archdeaconry of Clogher, later a prebend from Archbishop King and the vicarage of Finglass. The head of an English family settled in Ireland, with property both in that country and in Cheshire, he spent most of his time in London, where his wit procured him the friendship of Harley, Swift, and Pope, and opened to him the Scriblerus Club. Dr Johnson tells us that his well-timed change of politics coincided with the ejection of the Whigs in the end of Queen Anne's reign. After his wife's death he took to drinking, and died at Chester, July 1717, while on his way to Ireland. Next year Pope published a selection of his poems, mostly translations or adaptations, with the merit at least of being ever smooth and easy in versification. The best known of his poems is the *Hermit*, a polished and harmonious poem, based upon a tale in the *Gesta Romanorum*. Still better as poetry, however, are the two remarkable odes, the *Night-piece* and the *Hymn to Contentment*. See the admirable *Life* by Goldsmith, reprinted in the Globe edition of Goldsmith's works (1881).

Parody, a burlesque and consciously exaggerated imitation of a serious poem, the words of which should strike the ear with the very echo of the original. So to parody a writer is obviously to pay a compliment to his popularity, and at the outset we may admit the truth of Shaftesbury's paradox that 'a subject which will not bear raillery is suspicious,' provided it be not taken to mean that ridicule is to be the test of truth. The making of parodies is a harmless amusement, and moreover they may be an effective means of exposing weakness and affectation; but it must never be forgotten that, as there are, says Bacon, certain things to be privileged from jest, so there is a region of poetry into which this form of imitation may not enter. And, apart altogether from their subject, there are some poems so unapproachably beautiful in mere form and melody that to attempt a parody is a sin. Yet there are fools of such obliquity of vision and darkened understanding that they will rush in to tread even upon holy ground and try to wring a jest out of anything. For example, Sir Charles Hanbury Williams' *Old England's Te Deum* is a form of merriment altogether to be disallowed, as are also the Mock Litanies and Visitations of Sick Parliaments of Puritan times, and those three indifferent performances of Hone, mag-

nified in 1817 by the foolishness of persecution into 'impious, profane, and scurrilous libels.'

To show any reason for its existence a parody must be very good, its subject legitimately within the range of the comic, itself skilful as an adaptation of a well-known original, and that original neither too good to be above, nor too bad to be beneath, ridicule. Its highest end is to emphasise by the exaggeration of caricature some mannerism or trick of metre; its surest success depends on a felicity in catching the flow of some familiar and favourite rhythm. It is true that thoroughly to enjoy a parody must detract a little from our pleasure in the original; yet no parody will please which is not genial and human, the child at once of appreciation and knowledge. At its highest, as in Calverley, it flows from a quite unusual combination of delicacy, creative imagination, and faculty for imitation, added to a dexterous mastery of rhythms. Jeffrey, in his review of the famous *Rejected Addresses*, distinguishes between the mere imitation of externals and that higher and rarer art which brings before us the intellectual characteristics of the original. Of the latter order a diligent search has discovered but few English examples, amid the thousands of Mr Walter Hamilton's six bulky volumes.

The name parody is due to the Greeks, and the first parodist, according to Aristotle, was Hegemon of Thasos, whose parody of the *Gigantomachia* made the Athenians forget for a moment even their disasters in Sicily. Others ascribe its origin to Hipponax, a comic poet, who flourished about 540 B.C. The well-known *Batrachomyomachia*, or Battle of the Frogs and Mice, is an ancient mock-heroic *epos*; and there is extant, preserved in Athenæus, a fragment of several hundred lines by Matron, on an Attic banquet, in which each dish is introduced with epic solemnity after the manner of Homer. The comedies of Aristophanes contain many subtle touches of sarcastic banter belonging more or less definitely to this order, and we find a further development in the hexameter *Silli* of Timon of Phlius. Among the Romans we first meet this form of literature in the period of decline. The first satire of Persius is interspersed with numerous parodies on the most popular poems of the day, but there seems no adequate evidence for the assertion that the most severe of these were aimed at the verses of Nero. In France the burlesques of Scarron (*Virgile travesti*) and Dassoucy created a taste which Boileau and others strove to counteract, and were imitated in England by Charles Cotton and John Philips in his *Splendid Shilling*—a vastly overrated outrage on *Paradise Lost*. Of modern English parodies some of the most felicitous examples are to be found in the *Rejected Addresses*, full of clever and genial satire unblemished by vulgarity, of which its authors could say that of the twelve poets imitated 'not one ever betrayed the least soreness or refused to join in the laugh that we had occasioned.' The Bon Gaultier *Ballads*, by Aytoun and Sir T. Martin, contain six admirable imitations professing to be by the unsuccessful candidates for the laureateship on the death of Southey. There are some exquisite examples in the two classical children's books of Lewis Carroll, but no parodies can be compared with those to be found in C. S. Calverley's *Verses and Translations* and *Fly Leaves*. Of these it is enough merely to name 'The Cock and the Bull,' and 'Lovers, and A Reflection' as masterpieces of the art. Seven clever imitations of as many leading poets of the day, including the reputed writer himself (A. C. Swinburne), were published anonymously as *The Heptalogia, or the Seven against Sense* (1880). Among elaborate prose parodies most famous

are the *Epistola Obscurorum Virorum*, but of these either the humour has long since evaporated, or modern men cannot now feel the merriment of what drew tears of laughter from the great Erasmus. Of modern English examples may be mentioned Thackeray's 'Codlingsby' on Disraeli, and 'George de Barnwell' on Lytton; Bret Harte's *Condensed Novels*; and F. C. Burnand's 'New Sandford and Merton,' and 'Strapmore' on a too popular novel by Ouida.

See the article **BURLESQUE**; Delepierre, *La Parodie chez les Grecs, les Romains, et les Modernes* (Lond. 1871); and for a vast collection of English examples of all degrees of value, Walter Hamilton's too voluminous *Parodies of the Works of English and American Authors* (6 vols. 1884-89).

Parole (Fr., 'word') is the declaration made on honour by an officer, in a case in which there is no more than his sense of honour to restrain him from breaking his word. Thus, a prisoner of war may be released from actual prison on his parole that he will not go beyond certain designated limits; or he may even be allowed to return to his own country on his parole not to fight again, during the existing war, against his captors. To break *parole* is accounted infamous in all civilised nations, and an officer who has so far forgotten his position as a gentleman ceases to have any claim to the treatment of an honourable man, nor can he expect quarter should he again fall into the hands of the enemy he has deceived. For parole evidence, see **EVIDENCE**.

Paropamisus, an ancient name still used for a ridge, less than 1000 feet above the adjacent country, which forms part of the northern edge of the great plateau of Persia and Afghanistan, almost connecting the Hindu Kush (q.v.) on the east with the Elburz Mountains to the west (see **ASIA**, Vol. I. p. 487).

Paros, one of the larger islands in the Cyclades division of the Greek Archipelago; a low pyramid in shape, it has an area of 64 sq. m. and a pop. of nearly 7000, of whom some 2200 live in the capital, Paroskia. Wine, figs, and wool are exported. The quarries of the famous white Parian marble are near the summit of Mount St Elias (ancient *Marpessa*), and are not yet exhausted. Archilochus and Polygnotus, the painter, were born on Paros.

Parotid Gland. See **DIGESTION**, **SALIVARY GLANDS**.

Parquetry, a kind of wood mosaic used only for flooring. Parquetry floors are usually of oak, but other and more ornamental woods have also been much used for giving variety and beauty to the pattern. In the more elaborate kinds of parquetry veneers are used, but it is much more generally composed of blocks of wood squared at the sides, and laid down so as to combine and form a geometric pattern.

Parr. See **SALMON**.

Parr, CATHARINE, the sixth wife of Henry VIII., was the daughter of Sir Thomas Parr, and was born in 1512. Married first to one Edward Borough, possibly Lord Borough, and afterwards to Lord Latimer, she on July 12, 1543, became queen of England by marriage with Henry VIII. She was distinguished for her learning and for her knowledge of religious subjects, her discussion of which with the king had well-nigh brought her to the block, like so many of her predecessors. Her tact, however, saved her; for she made it appear to the king's vanity that she had only engaged him in discourse about the Reformation in order to derive profit from his majesty's conversation. She persuaded Henry to restore the right of succession to his daughters, and interested herself on behalf of the universities. After Henry's death she married

(1547) Sir Thomas Seymour, and died from the effects of child-birth in the following year.

Parr, SAMUEL, a once notable scholar, was born the son of a surgeon at Harrow-on-the-Hill, January 15, 1747. He attended Harrow School, and, after being found unfit for apprenticeship to his father's profession, was sent to Emmanuel College, Cambridge, in 1765. Two years later his father's death obliged him to leave Cambridge and accept an assistant-mastership at Harrow. Here he remained nearly five years, but, disappointed of the head-mastership on Dr Summer's death (1771), started an independent school at Stanmore, and kept it going five years. He was head-master of Colchester grammar-school (1776-78) and of Norwich (1778-86). His clerical preferments were the rectory of Asterby in Lincolnshire, the vicarage of Hatton near Warwick, and a prebendal stall in St Paul's Cathedral. He spent almost the half of his life at Hatton, and here he died, March 6, 1825. The degree of LL.D. was given him by Cambridge in 1781. In 1787 he published an edition of Bellenden, to which he prefixed his celebrated preface, which is as remarkable for its uncompromising advocacy of Whig principles as for the scrupulous Ciceronianism of its Latinity.

It is almost impossible to understand the reputation which Dr Parr once had. None of his voluminous writings justify it. That he was in some respects an accomplished scholar is undoubted, for he could write Latin of Ciceronian purity and finish; but it is equally undoubted that he never did anything with his boasted scholarship, and has left the world absolutely nothing to keep him in remembrance. Yet his complete works (edited by Dr J. Johnstone in 1828) form eight enormous tomes, and contain 5734 octavo pages, many of them printed in small type. They relate to matters historical, critical, and metaphysical, but in all 'the thread of Parr's verbosity is finer than the staple of his argument.' To his conversational powers alone he owed the fame that he enjoyed during his life. He was an amazing, an overwhelming talker. Bold, dogmatic, arrogant, with a memory profoundly and minutely retentive, and with a genuine gift of ephemeral epigram, he seemed, at the tables of statesmen, and wits, and divines, to be a man of tremendous talent, capable of any literary feat; but the learning and the repartee have left little trace of their existence, and posterity declines to admire the wonders that it has neither seen nor heard.

See E. H. Barker's ill-arranged *Parriana* (2 vols. 1828-29), De Quincey's essay, and the *Lives* by Field (1828) and Johnstone (1828).

Parr, THOMAS ('Old Parr'), was born, according to the tradition, in 1483 and died in 1635. See **LONGEVITY**.

Parra. See **JACANA**.

Parrakeet, or **PARROQUET**, a name very commonly given to many of the smaller species of the parrot family. The

Zebra Parrakeet
(*Melospittacus undulatus*).

only one we shall notice is the Zebra Parrakeet (*Melopsittacus undulatus*), a very beautiful little species, which has often been brought to England, and will breed in confinement. In the vast inland plains of Australia this parrakeet is to be seen in flocks of many hundreds feeding on the seeds of the grasses, which afford food also to many other small species. See PARROT.

Parramatta, a town of New South Wales, stands on a western extension of Port Jackson, 14 miles W. of Sydney, with which it is connected both by steamer and railway. The streets are wide and regular. 'Colonial tweeds,' 'Parramatta cloths' (first made at Bradford from wool exported hence), beer, soap, candles, and tiles are manufactured. Much fruit, especially the orange, is grown here. Pop. (1881) 8433; (1888) 12,000. Parramatta, formerly called Rosehill, is, after Sydney, the oldest town in the colony, having been laid out in 1790.

Parrhasius, one of the greatest painters of ancient Greece, was at Athens and already distinguished before the end of the 4th century B.C. According to Xenophon, he held a conversation with Socrates, and he was a younger contemporary of Zeuxis. Parrhasius appears to have surpassed all his predecessors in purity of design, accuracy of drawing, force of expression, and what is technically called 'finish.' And it seems that his vanity and pride were equal to his artistic skill.

Parricide (Lat. *paricida*) is rather a popular than a legal term. In the Roman law it comprehended every one who murdered a near relative; but in English the term is usually confined to the murderer of one's father, or of one who is *in loco parentis*. The parricide does not, in any respect, differ in Britain from the murderer of a stranger; in both cases the punishment is death by hanging. In the Roman law a parricide was punished in a much more severe manner, being sewed up in a leather sack, along with a live cock, viper, dog, and ape, and cast into the sea.

Parrish, EDWARD (1822-72), an American pharmacist, member of a family of distinguished physicians, connected for many years with Philadelphia, and best known through 'Parrish's Chemical Food.' This is the popular name for a non-official preparation medicinally known as *Compound Syrup of Phosphate of Iron*, every drachm of which contains 1 grain of phosphate of iron, 2½ of phosphate of lime, besides soda and potash.

Parrot, the type of a large and important group of birds, divided into numerous families and genera. The parrots form an extremely compact group, showing but little structural variation, and offering no 'intermediate forms' to indicate their relationship to other birds. It has been suggested that they come nearest to the birds of prey, but this is at present no more than a suggestion. They are pre-eminently tropical birds, and arboreal in habit; some species, however, range into colder countries—e.g. Patagonia and New Zealand—and some, such as the burrowing Ground Parrot of New Zealand (*Strigops*), now nearly exterminated by the cats run wild which infest the scrub, are not arboreal. They are fruit and seed eating birds, with the exception of the Kea (q.v.), which has, since the colonisation of New Zealand, taken to a carnivorous diet. As a rule the parrots are brightly coloured birds, being often, like other forest-frequenting creatures, green; there are some species, however, which are not brilliantly coloured. There is occasionally a difference of colour in the two sexes, which is best marked in species belonging to the genus *Eclectus*; in these the prevailing colour of the female is red, and of the male green; the

differences are so marked that they were actually referred to quite different genera until Dr A. B. Meyer showed conclusively that the red and green forms were merely the two sexes of the same species. The intelligence of parrots has been often commented upon, as also their power of imitating human speech; any one, however, who can endure for a sufficient time that pandemonium of noise, the parrot-house at the Zoological Gardens, will find that the clearness of utterance of the Myna or Indian Starling exceeds that of any parrot. The

great age to which parrots will live has often been exaggerated, but it is at any rate certain that some species will survive for fifty years in confinement, for an individual of the Greater Vasa Parrakeet (*Coracopsis vasa*) lived for more than fifty years at the Zoological Gardens. Parrots make their nests in holes, and lay white eggs, as is commonly the case where the eggs are concealed. Garrod has divided the parrots, on anatomical

The Gray Parrot.

grounds, into two families: (1) *Palæornithidæ* (including the Cockatoo, q.v., and Lory, q.v., the flightless New Zealand *Strigops*, and the large genus *Palæornis*) and (2) *Psittacidæ* (including the Macaws, the African parrots of the genus *Psittacus*, the American *Chrysotis*, the Australian *Platyercus*, and some other forms). The Gray Parrot (*Psittacus erythacus*), which has been a familiar cage-bird in Europe for hundreds of years, is a native of Africa, especially of West Africa. The Great Macaw belongs to the sub-family of *Conurina*, found mainly in America, one genus only (*Palæornis*) occurring in India and Africa. See Dr W. T. Greene's *Parrots in Captivity* (3 vols. 1884).

Parrot-fish, or PARROT-WRASSE (*Scarus*), a genus of fishes of the family *Labridæ*. The name seems to refer to the frequently bright colours, and partly to the shape of the mouth; for the jaws form a strong and sharp beak, and the teeth are soldered together. Over a hundred species are known, especially from the tropical coral-banks, on which they browse. The most northern species (*S. cretensis*) is the famous *Scarus*, about which Greek and Roman epicures were extraordinarily enthusiastic. Wonderful stories were told of its love, its wisdom, its habit of rumination, and the sounds which it makes. Pliny relates that in the reign of the Emperor Claudius a lot of *Scari* were brought from the Troad, released in the Italian sea, and strictly protected for five years till they became very abundant. The fish feeds chiefly on *Fucus*, and is certainly very palatable.

Parry, SIR WILLIAM EDWARD, Arctic navigator, was born at Bath, 19th December 1790, entered the navy as midshipman in 1806, and saw some active service against the Danes in 1808. In 1810 he was sent to the Arctic regions in command of a ship, for the purpose of protecting the British whale-fisheries. At this time he worked out rules for determining accurately the altitude of the pole by observations of the fixed stars. Parry took command in five expeditions to the Arctic regions: (1) in 1818, under Ross, who set out to find the North-west Passage; (2) in 1819, in chief command of two vessels, he explored Barrow Strait, Prince

Regent's Inlet, and Wellington Channel, and wintered in Melville Island, but his attempt in the spring to reach Behring Strait was frustrated by the state of the ice; (3) from May 1821 to November 1823 he was again at the head of an expedition, which, however, achieved little; (4) a fourth voyage in 1824-25 had a like result; (5) his last voyage was an attempt (1827) to reach the North Pole on sledges by way of Spitzbergen—in which he was of course unsuccessful. After his return home from his second expedition he was awarded the £5000 which parliament had offered to the navigator who first crossed 110° W. long. In 1823 he was appointed hydrographer to the navy; in 1829 was knighted, along with Sir John Franklin; and in 1837 was made comptroller of a department of the navy. In 1846 he retired, accepting the post of superintendent of Haslar; in 1852 he was raised to the rank of rear-admiral, and in the following year was appointed governor of Greenwich Hospital, an office which he held till his death, 8th July 1855, at Enns in Germany. A collected edition of his voyages was published in 1833 (Lond. 5 vols.). See *Life* by his son, Rev. Edward Parry (Oxford, 1857).

Parsees (*Parsis*, 'people of Pars or Fars'—i. e. ancient Persia; sometimes called Guebres, q.v.) is the name of the small remnant of the followers of the ancient Persian religion, as established or reformed by Zoroaster (Zarathustra or Zerdusht). The relation in which Zoroaster stood to the ancient Iranian faith and his date have been much debated; the very fact of his historical existence has even been denied; and accordingly it is difficult to dogmatise on the original principles of the Zoroastrian faith. These questions will be more fully discussed under the heads ZOROASTER and ZEND-AVESTA. It has been alleged that at first the doctrine was a pure Monotheism; that Zoroaster taught the existence of but one deity, the Ahura-Mazdāo (Ormuzd), the creator of all things, to whom all good things, spiritual and worldly, belong. The principle of his speculative philosophy, on the other hand, was dualism: there being in Ahura-Mazdāo two primeval causes of the real and intellectual world—the Vohu Manō, the Good Mind or Reality (Gaya), and the Akem Manō, or the Naught Mind or Non-reality (Ajyāiti). Certainly, however, the pure idea of Monotheism, if it ever existed, did not long prevail. The two sides of Ahura-Mazdāo's being were taken to be two distinct spirits, Ahura-Mazdāo and Angrō-Mainyush (Ahriman), who represented Good and Evil—God and Devil. These each took their due places in the Parsee pantheon ere long, and Parsism became a characteristic dualism.

The Zoroastrian creed flourished up to the time of Alexander the Great, throughout ancient Irania, including Upper Tibet, Sogdiana, Bactriana, Media, Persis, &c.; but after Alexander's death it gradually lost ground, rapidly declined under his successors, and under the Arsacidæ was much depressed. On the establishment of the Sassanians (212 A.D.), a native Persian dynasty, by Ardashir (Artaxerxes), the first act of the new king was the general and complete restoration of the partly lost, partly forgotten books of Zerdusht, which he effected, it is related, chiefly through the inspiration of a Magian Sage, chosen out of 40,000 Magi. The sacred volumes were translated out of the original Zend into the vernacular and disseminated among the people at large, and fire-temples were reared throughout the length and breadth of the land. The Magi or priests were all-powerful, and their hatred was directed principally against the Greeks. 'Far too long,' wrote Ardashir, the king, to all the provinces of the Persian empire, 'for more than five

hundred years, has the poison of Aristotle spread.' The fanaticism of the priests often also found vent against Christians and Jews. The latter have left us some account of the tyranny and oppression to which they as unbelievers were exposed—such as the prohibition of fire and light in their houses on Persian fast-days, of the slaughter of animals, the baths of purification, and the burial of the dead according to the Jewish rites—prohibitions only to be bought off by heavy bribes. In return the Magi were cordially hated by the Jews; but later we frequently find Jewish sages on terms of friendship and confidence with some of the Sassanian kings. From the period of its re-establishment the Zoroastrian religion flourished uninterruptedly for about 400 years, till in 651 A.D., at the great battle of Nahavand (near Ecbatana), the Persian army under Yezdejdird was routed by the calif Omar. The great mass of the population was converted to the Mohammedan faith; the small remnant fled to the wilderness of Khorassan, but were subjected, as might be expected, to severe oppression and persecution. Some nine thousand 'Guebres' are still found in Persia, mainly in Yezd, Kerman, and at Teheran. Others, who preferred emigration to the endless tribulations inflicted upon them by the conquering race, found a resting-place along the western coast of India, chiefly at Bombay, Surat, Ahmedabad, and the vicinity, where they now live under English rule, and are recognised as one of the most respectable and thriving sections of the community, being for the most part merchants and landed proprietors. Parsee traders have also settled at Calcutta, Madras, Aden, Zanzibar, in Burma, and in China. They bear equally with their poorer brethren in Persia the highest character for honesty, industry, and peacefulness, while their benevolence, intelligence, and magnificence outvie that of most of their European fellow-subjects. Their general appearance is to a certain degree prepossessing, and many of their women are strikingly beautiful. In all civil matters they are subject to the laws of the country they inhabit; and its language is also theirs, except in the ritual of their religion, when Zend, the holy language, is used by the priests, who as a rule, however, have no more knowledge of it than the laity. They are forward to embrace the advantages of English education, and not a few have studied law in England. Conspicuous amongst Parsee merchant-princes was Sir Jamsetjee Jejeebhoy (q.v.). In 1881 there were 73,760 Parsees in British India, two-thirds of them in Bombay city.

We have spoken of the leading fundamental doctrines as laid down by their prophet. Parsees do not eat anything cooked by a person of another religion; they also object to beef and pork, especially to ham. Marriages can only be contracted with persons of their own caste and creed. Polygamy, except after nine years of sterility and consequent divorce, is forbidden. Fornication and adultery are punishable with death. Their dead are not buried, but exposed on an iron grating in the Dakhma, or Tower of Silence, to the fowls of the air, to the dew, and to the sun, until the flesh has disappeared, and the bleaching bones fall through into a pit beneath, from which they are afterwards removed to a subterranean cavern.

Ahura-Mazdāo being the origin of light, his symbol is the sun, with the moon and the planets, and in default of them the fire. Temples and altars must for ever be fed with the holy fire, brought down, according to tradition, from heaven, and the sullying of whose flame is punishable with death. The priests themselves approach it only with a half-mask over the face, and never touch it but with holy instruments. But however great the awe felt by Parsees with respect to fire and

light (they are almost the only eastern nation who abstain from smoking), yet they never consider these as anything but emblems of divinity. The fires are of five kinds. There are also five kinds of 'Sacrifice,' which term, however, is rather to be understood in the sense of a sacred action—including the slaughtering of animals; prayer; the sacrifice of expiation, consisting either (a) in flagellation or (b) in gifts to the priest; and, lastly, the sacrifice for the souls of the dead. The purification of physical and moral impurities is effected, in the first place, by cleansing with holy water, earth, &c.; next, by prayers and the recitation of the divine word; but other self-castigations, fasting, celibacy, &c. are considered hateful to the Divinity. The ethical code may be summed up in the three words—purity of thought, of word, and of deed: a religion 'that is for all, and not for any particular nation,' as the Parsees say. Various superstitions have in the course of the tribulations of ages and the intimacy with neighbouring countries defiled the original purity of this creed, and its forms now vary much among the different communities of the present time. There are two main sects amongst them, as well as Conservatives and Liberals in usage, the latter allowing many innovations resisted by the others.

For further information, see the articles PERSIA, ZEND-AVESTA, ZOROASTER (and works there quoted), DEVIL; Monier Williams, *Modern India* (4th ed. 1887); Houtum-Schindler in the *Ztschr. Deutsch. Morgenl. Ges.*, xxxvi.; Haug, *Essays on the Sacred Language, Writings, and Religion of the Parsees* (2d ed. by West, 1878); Hovelacque, *L'Avesta, Zoroastre, et le Mazdéisme* (1880); and Dosabhai Framji Karaka, C.S.I., *History of the Parsis* (2 vols. Lond. 1884).

Parsley (*Petroselinum*), a genus of plants of the natural order Umbelliferae. The species are annual or biennial, branching, smooth, herbaceous plants, with variously pinnated leaves. Common Parsley (*P. sativum*), which has tripartite shining leaves, one of our best-known culinary plants, is a native of the south of Europe, growing chiefly on rocks and old walls, and naturalised in some parts of England. The cultivation of parsley is extremely simple, seed requiring to be sown annually in order to keep up a constant supply. A variety with curled leaflets is generally preferred to the common kind with plain leaflets, as finer and more beautiful, being often used as a garnish; it is also safer, as the poisonous Fool's Parsley (q.v.) is sometimes gathered by mistake instead of the other. Hamburg Parsley is a variety with a large white carrot-like root, cultivated for the sake of its root, and much in the same way as the carrot or parsnip. To produce large roots and of delicate flavour a very rich soil is required. The foliage of parsley is not merely of use for flavouring soups, &c., but is nutritious at the same time that it is stimulating, a quality which it seems to derive from an essential oil present in every part of the plant. Parsley contains also a peculiar gelatinous substance called *Apiine*. The bruised leaves of parsley are sometimes employed as a stimulating poultice. The seeds are a deadly poison to many birds, and when powdered they are sometimes used for killing lice.

Parsnip (*Pastinaca*), a genus of plants of the natural order Umbelliferae, having compound umbels with neither general nor partial involucre; yellow flowers, with roundish, involute, sharp-pointed petals; calyx almost without teeth; fruit dorsally compressed and flat, with a broad border, the ridges very fine. The species are annual, biennial, or perennial herbs, with carrot-like, often fleshy roots and pinnate leaves. The Common Parsnip (*P. sativa*) is a native of England, although

not of Scotland, and is abundant in some districts, particularly in chalky and gravelly soils. It is also found in many parts of Europe and of the north of Asia. It is a biennial, with angular furrowed stem, 2 to 3 feet high, pinnate leaves with ovate leaflets, rather shining, cut and serrated, and a three-lobed terminal leaflet. The root of the wild plant is white, aromatic, mucilaginous, sweet, but with some acridness; and injurious effects have followed from its use. Cultivation has greatly modified the qualities both of the root and foliage, rendering them much more bland. The parsnip has long been cultivated for the sake of its root, which in cultivation has greatly increased in size and become more fleshy. The flavour is disliked by some, as well as the too great sweetness, but highly relished by others; and the root of the parsnip is more nutritious than that of the carrot. The produce is also on many soils of larger quantity; and although the parsnip delights in a very open rich soil, it will succeed in clayey soils far too stiff for the carrot. It is rather remarkable that it has not been extensively cultivated as a field-crop, and for the feeding of cattle, except in the Channel Islands and in limited districts of continental Europe, more especially as cattle are very fond of it; and not only is the flesh of cattle fed on it of excellent quality, but the butter of dairy-cows fed on parsnips in winter is said by many to be superior to that produced by almost any other kind of winter-feeding. The mode of cultivation of the parsnip scarcely differs from that of the carrot. There are several varieties in cultivation. A very large variety called *coquaine*, cultivated in the Channel Islands on deep sandy soils, has roots sometimes 3 or 4 feet long; but this is fully twice the ordinary length, and there is a smaller turnip-rooted variety sometimes cultivated in gardens where the soil is very shallow. The parsnip is used chiefly in winter, whether for the table or for feeding cattle. It is improved rather than injured by frost, but is apt to become *rusty* if allowed to remain too long in the ground, and exhibits acid qualities after it has begun to grow again in spring. The root of the parsnip is much used in the north of Ireland for making a fermented liquor with yeast and hops, and both in England and Ireland for making *parsnip wine*. A spirit is also obtained from it similar to that of the potato. Another species, the Cut-leaved Parsnip or Sekakul (*P. Sekakul*), having pinnatifid cut leaflets, a native of India, Syria, and Egypt, is cultivated in the Levant, and is very similar in its uses to the common parsnip.

Parson, the incumbent of a benefice in a parish. He is called parson (Lat. *persona*) because he represents the church for several purposes. See CLERGY.

Parson Bird. See HONEY-EATER.

Parsons, FATHER ROBERT, the chief of the English Jesuits in their golden age, and a man of remarkable talents and achievements, was born of respectable parents in Somersetshire in 1546. When eighteen years of age he passed from the free school at Taunton to St Mary's Hall, Oxford, and after two years migrated to Balliol College, where he took his degrees of bachelor and master, and became a fellow and tutor. Here he twice took the oath abjuring the papal supremacy, but he never received orders in the English Church. His enemies in college brought charges against him which led to his forced retirement from Oxford in 1574. He shortly afterwards became a Roman Catholic, and went to Padua with a view of there studying medicine, but, soon changing his mind, he set out on foot to Rome, and offered himself to the Society of Jesus, which he entered July 1575. He was ordained priest in 1578. When in the

following year Dr (afterwards Cardinal) Allen, superior of the Douay seminary, succeeded in persuading the Jesuits to join with the seminary priests in the work of the English mission, Parsons and Campion (q.v.) were selected for the new venture. They left Rome in April 1580, with strict injunctions to meddle neither directly nor indirectly in affairs of state. Parsons landed at Dover, June 11, disguised as a merchant of jewels, in a coat of 'buff laid with gold-lace, with hat and feather.' His activity and success took both Catholics and Protestants by surprise. He employed six printers on a secret press, and by the rapidity of his movements for twelve months baffled all the attempts of the government to catch him. But soon after the apprehension of his companion, Campion, in July 1581, Parsons found it prudent to escape to the Continent, from which he never again returned to England.

Meanwhile, following the natural bent of his mind, and ignoring or evading his original instructions, he had busied himself with state intrigues, sounded the political dispositions of influential Catholic laymen when treating with them of their consciences, and thought out schemes for the subjection of England to the pope by force of arms. In Normandy, whither he at first retired, he had conferences with the Duke of Guise and with Father Creighton, who had been despatched by the pope into Scotland to negotiate with the Duke of Lennox for the liberation of the Queen of Scots; and a little later, during April and May 1582, he was at Paris conferring with the Provincial of the French Jesuits, the Archbishop of Glasgow, the papal nuncio, and the agent of the king of Spain, concerning a project for the invasion of England. The plan, which was chiefly the offspring of Parsons' brain, was carried by Creighton to the pope, and by Parsons himself to King Philip at Madrid. Now began his intimacy and influence with the Spanish king, and the series of political enterprises which culminated in the Armada of 1588. Affairs of state did not, however, exclusively occupy the Jesuit's active mind. At Rouen in 1582 he had finished his book, the *Christian Directory*, which has found favour with Protestant divines; and, with the aid of the Duke of Guise, he founded at Eu a seminary for youths in preparation for the colleges of Douay and Rome. For a short time in 1588 he was rector of the college at Rome; and after the failure of the Armada he organised seminaries or clerical establishments for his countrymen at Valladolid in 1589, St Lucar in 1591, Seville and Lisbon in 1592, and at St Omer in 1593. In the reaction which followed on the death of Allen (1595) the jealousy and suspicion with which the more loyal section of the clergy had for some time regarded the ambitious schemes of the Jesuits and the Spanish party developed into a scandalous quarrel. Disturbances broke out among the prisoners at Wisbeach and in the English college at Rome. Parsons, who went from Madrid to Rome to again assume the rectorship of the English college, now persuaded the pope to appoint George Blackwell (q.v.), a partisan of the Jesuits, as archpriest over the secular clergy, with the view of keeping the chief direction of affairs, political and ecclesiastical, in his own hands. The appointment was resisted by the leaders of the seculars with an animosity which threatened to create a schism. Parsons, upon whom the odium of the appointment chiefly fell, was accused of deceiving the pope, of tyranny over the clergy, and of continued treason against his country. The stringency of the penal laws against Catholics was laid at his door. An appeal carried to Rome by four delegates of the secular clergy led to a diminution of the Jesuits' power, though Parsons persisted to the end in resisting the en-

deavours of his opponents to obtain an episcopal government. He died at Rome, as rector of the English college, April 15, 1610.

His industry and power of work were extraordinary. He wrote English forcibly and lucidly, and was a master in the arts of controversy. His domineering spirit and political partisanship created for him bitter enemies, while his mode of prosecuting his ends justly exposed him to charges of double-dealing, equivocation, and reckless slander of his opponents. He was otherwise irreproachable in his private morals. His ambition was for his order and not for himself, and he modestly avoided the cardinal's hat. He knew how on occasions to exercise tact and prudence, and, when it was his purpose to do so, no one could write with more persuasive piety. Among the best known of his voluminous publications is *The Conference on the next Succession to the Crown*, written with the assistance of Allen and Sir Francis Englefield in favour of the infanta of Spain. He here insists on the right of the people to set aside, on religious grounds, the natural heir to the throne; and advocates principles which afterwards obtained for him the title of the first English Whig. Parliament (35 Eliz.) made it treason to possess a copy of the book, which was reprinted in the interests of Cromwell in 1648. It was again reprinted in 1681, and publicly burned at Oxford in 1683. Another curious work by Parsons, for some time disseminated in manuscript only, was his *Memorial for the Reformation*, in which he lays down rules for the guidance of the government, in the expected event of England's subjection to the pope. The book was read at dinner-time in the English college at Valladolid when Philip was preparing another Armada. The Jesuit's power of invective may be seen in his *Responsio ad Elizabethæ edictum*—a bitter libel on the queen's ministers in reply to the royal proclamation of November 1591. His *Apology* for the government of the archpriest (1601) is historically interesting, while his *Manifestation of the Great Folly and Bad Spirit of Certain in England calling Themselves Secular Priests*, a passionate attack upon the conduct and morals of his clerical brethren, exhibits him on his weakest side.

An impartial biography of this many-sided personality is still a desideratum. A brief sketch of his life and works will be found in Wood's *Athenæ* (ii. 83), and from other points of view in Dodd's *Church History* and Oliver's *Collections*. The best estimate of his character as a Jesuit missionary is that by Richard Simpson in his *Life of Campion*, where Parsons' career in England is fully traced. For his political intrigues between 1582 and 1595 the *Letters and Memorials of Cardinal Allen*, published by the Fathers of the Oratory, must be consulted. An account of his quarrels with the secular clergy will be found in the *Conflicts of Jesuits and Seculars in the Reign of Elizabeth*, by the present writer; and a number of letters and documents, with much miscellaneous information illustrating the whole period of his activity, are scattered through the volumes of Tierney's *Dodd* and Mr Foley's *Records of the English Province of the S. J.*

Parsonstown, or BIRR, a market-town in King's County, Ireland, on the river Brosna, 89 miles by rail W. of Dublin. The castle, anciently the seat of the O'Carrolls, was granted by James I. to Laurence Parsons, ancestor of the present proprietor, the Earl of Rosse. Parsonstown is a handsome, well-built town, with a statue of the Duke of Cumberland, the victor of Culloden, and a bronze statue (1876) by Foley of the Earl of Rosse, the astronomer. Pop. 4955.

Parthenogenesis (from the Gr. *parthenos*, 'a virgin,' and *genesis*, 'production'), asexual reproduction. See GENERATIONS (ALTERNATION OF).

Parthenon (Gr., 'maiden's-chamber'), the temple of Athena (q.v.) at Athens, probably the

most perfect specimen of Greek architecture. It is a great Doric temple, erected, under the superintendence of Phidias, by Ictinus and Callicrates, of Pentelic marble, with eight pillars in the width, and fifteen at each side (not counting those at the corners). The total length is 228 feet; height to top of pediment, 64 feet. This magnificent relic of Periclean times stood little injured by weather or war until, when it was being used as a Turkish magazine in 1687, a bomb from a Venetian mortar burst within, and the explosion reduced the building to its present ruined condition. Illustrations will be found at GREEK ARCHITECTURE; a view of the ruins at ATHENS; and part of the frieze at ELGIN MARBLES. See the Dilettanti Society's *Athenian Architecture* (1851; new ed. 1889).

Parthenopean Republic. See NAPLES.

Parthia, anciently a district in what is now northern Persia, lay between Media on the west and Bactria on the east, was separated from the Caspian Sea on the north by the savage land of Hyrcania, and was bordered on the south by the Iranian deserts. The Parthians were of Scythian descent, immigrants and nomads, who eventually adopted the Median dress and a semi-Aryan speech. But in war they clung to their national habits: they always fought on horseback, and both horse and rider were clad throughout in scale armour; their weapons were bows and arrows, which they discharged backwards during pretended flight as well as forwards in direct attack. Their armies were made up principally of slaves, commanded by their masters, the aristocratic nucleus of the Parthian nation. Parthia was subject successively to the Assyrians, the Medes, Persians, Greeks (Alexander the Great and his generals), and the Seleucids of Syria. In or about 250 B.C. a chief named Arsaces founded an independent kingdom in Hyrcania; his brother and successor, Tiridates, established himself in Parthia in 241 B.C. But the early kings of Parthia had much ado to maintain their position against their suzerains, the Seleucid 'great kings'; and it was not until Mithridates I. (171-138) ascended the throne, and had subdued Bactria, Media, and Babylonia, that the Parthian princes shook off completely the Syrian (Greek) yoke and became independent. This king made Parthia supreme in Iran. He greatly strengthened his power by resting it in great part upon the Magi (q.v.) and the ancient creed of Zoroaster. In the reign of his successor the Seleucid king made a determined effort to recover the lost provinces in Iran, but the expedition cost him his life and his army (129 B.C.). No sooner was this enemy disposed of than another and more formidable foe appeared in the east—the Scythians. They defeated and slew (128) Phraates, king of Parthia, levied tribute from his kingdom, and established themselves within its borders. During the first half of the 1st century the Parthian kings, by interfering in the affairs of Armenia, first came into contact with the Romans. The unprovoked invasion of Mesopotamia by Crassus (53 B.C.), his disastrous defeat and his death, make the first act in the drama of real contest that then ensued between Rome and Parthia. The remaining acts were the conquest of Syria and Palestine by Parthia (40-38); the disastrous campaign of Antony in Armenia (36 B.C.); then, after a century and a half of, in Parthia, mostly internal dissensions, the renewal of hostilities by Trajan (115-117 A.D.); the brilliant campaign of Avidius Cassius (164-165); the capture of Ctesiphon by Severus (199) and his repulse before Atra (201); and the defeat of Macrinus, the Roman emperor, and his ignominious payment of fifty million denarii to his enemy (217-218). During nearly all this period the Euphrates

was looked upon by both combatants as the frontier line between their respective empires. The Parthian capital was Ctesiphon, a suburb or twin-capital with Seleucia, all through the duel with Rome. The Parthian empire was overthrown in a battle fought in 224 (or 227) by Ardashir, a prince of Persia, a province of ancient Iran, who founded the subsequent dynasty of the Sassanids (see PERSIA). The Parthian kings during the most flourishing period of their power used Greek as their official language, adopted some of the Greek deities, and in other ways put themselves under the influence of Greek civilisation. But the hold of this civilisation grew weaker as time went on, and Greek ceased to be the official language in the 2d century A.D.

See histories of Parthia by Rawlinson (1873), Schneidewirth (Heiligenstadt, 1874), and Spiegel (Leip. 1887).

Partick, a town of Lanarkshire, prettily situated, chiefly on a rising ground on the Kelvin, immediately above its junction with the Clyde, and 3 miles WNW. of the Cross of Glasgow, of which city it now forms a suburb. Nine-tenths of the workmen of Partick are engaged in shipbuilding-yards, but there are also many flour-mills, cotton-factories, and bleach-fields. A large proportion of the inhabitants are engaged in business in Glasgow, and for their accommodation extensive ranges of handsome villas have been built here. Partick was made a police-burgh in 1852-66. Pop. (1851) 3131; (1881) 27,410; (1891) 36,538. See *Wallace's Parish of Govan* (1877).

Partinico, a town of Sicily, 32 miles SW. of Palermo by rail. Pop. 21,000.

Partnership is the relation which subsists between persons carrying on business in common with a view to profit. Technically it has no reference to the relation between shareholders and a limited company. The law of partnership for the United Kingdom has been placed on a clear and intelligible footing by the Partnership Act, 1890, 53 and 54 Vict. chap. 39, which does not change the law established by decisions, but states it in an authoritative manner. Joint tenancy, or joint property, or sharing gross returns does not by itself make a man a partner. The receipt of a share of net profits is a strong indication of partnership, but it is not conclusive in such cases as a creditor, a servant or agent, the widow or child of a deceased partner, the vendor of the good-will of a business, receiving payment or remuneration by way of a share in net profits. Where the person carrying on the business becomes bankrupt, however, the creditor or vendor who is paid out of profits is postponed to the other creditors. In Scotland the firm is a legal person distinct from the individual partners, but a partner may be charged on a decree against the firm, and on payment of a firm debt is entitled to relief *pro rata* from the firm and the other partners. In all ordinary transactions each partner, as agent, binds the firm, unless the person dealt with knows that the partner has in fact no authority. The firm is not bound where the partner pledges its credit for a purpose apparently not connected with the business. In England and Ireland the partners are liable jointly, in Scotland severally, for firm debts: in England and Ireland the estate of a deceased partner is subject to prior payment of separate debts. The firm is liable for the misapplication by a partner of property received by the firm, except in the case of property of which the partner is trustee when the other partners have no notice of the trust. Every person who by words or conduct holds himself out as a partner, or permits himself to be so represented by others, is liable to anybody who relied on such representations. But this will not make the executors of a deceased partner liable because the name

of the deceased has been used by the firm after his death. The admissions of a partner bind the firm, and notice of any fact to a partner is also notice to the firm, except in the case of a fraud upon the firm. A new partner does not become liable, nor does a retiring partner cease to be liable, to existing creditors. But the consent of creditors to discharge a retiring partner, or to accept the new firm as the only debtor, is easily presumed from a course of commercial dealing. Continuing guarantees or cautionary obligations are revoked as to future transactions by any change in the constitution of the firm which is debtor or creditor in the obligation. Unless the contrary appears, property bought with the money of the firm is held to have been bought on account of the firm. Heritable property bought for the firm is treated as movable between partners. Unless otherwise agreed, all partners are entitled to share equally in profits and capital, and must contribute equally to losses. The firm must indemnify every partner in respect of proper payments made and liabilities undertaken by him. If a partner advances capital beyond his share, he is entitled to interest at 5 per cent. Every partner may take part in management, but no partner is entitled to remuneration for so doing.

No new partner may be introduced without the consent of all the other partners. The majority of partners cannot expel a partner. Every partner has access to the firm books. If no time has been fixed for the duration of the firm, any partner may at any time dissolve it by notice to his copartners. If the partners go on trading after the time fixed for dissolution they are presumed to do so under their former agreement so far as that may be applied to a partnership at will. Every partner must account to the firm for any benefit derived by him from any partnership transaction, or any use of partnership property or business connection. The same rule applies if without consent a partner carries on a separate business competing with the firm. An assignment by a partner to his creditor of a share in the business does not entitle the creditor to inspect books, or to require accounts, or to interfere in management, but merely to receive share of profits, or to receive the value of the share when realised on dissolution. Apart from agreement, partnership is dissolved by the death or bankruptcy of any partner, or by the business becoming unlawful. Further, the court may decree a dissolution (1) where partner is of permanently unsound mind; (2) when partner becomes permanently incapable of performing his duties; (3) when partner's conduct prejudicially affects the carrying on business; (4) when partner persistently breaks the agreement, or so conducts himself that it is not reasonably practicable for the other partners to act with him; (5) when the business can only be carried on at a loss. A person dealing with a firm after change in its constitution is entitled to treat all *apparent* members of the firm as still partners until he receives notice of the change. A retiring partner, not known to be a partner, is not liable for debts contracted after his retirement. After dissolution the authority of partners to bind the firm continues so far as necessary for a proper winding up—viz. in having the property of the partnership applied to payment of the debts and liabilities of the firm, and the surplus assets applied in payment of what is due to the partners after deducting what is due by the partners to the firm. If after a partner's death or retirement the other partners carry on business without any settlement of accounts, they must account for share of profits or pay interest at 5 per cent. in the option of the outgoing partner or the representatives of deceased partner. An option to purchase, however, is generally given by the contract in such cases.

In Scotland, as already stated, the firm is a distinct *persona*. Therefore in actions by or against the firm the individual partners need not be named, though in practice one or two of them generally are named. Each partner may also sue the firm; and the firm may be sequestrated without any of the partners being sequestrated.

The law of the United States is based on English common law, but many of the states of the Union have their own special legislation; and, contrary to the practice of Britain, *limited* partnerships, resembling the French *Sociétés en Commandite* (see *COMMANDITE*), are fully recognised. On this subject the New York legislation has been generally followed; the *general* partners being responsible, the special partners liable only to the extent of the funds put by them into the concern. Creditors cannot directly proceed against the representatives of a deceased partner.

See Sir N. Lindley's *Treatise on the Law of Partnership* (6th ed. 1891), the great authority; also J. Parsons' *Exposition of the Principles of Partnership* (1889); F. Pollock's *Digest of the Law of Partnership* (4th ed. 1888); and, for the United States, Kent's *Commentaries* (13th ed. 1884), and Story, *Law of Partnership* (1841). See also the articles *COMPANY*, *CORPORATION*.

Partridge (*Perdix*), a genus of gallinaceous birds, of the family Tetraonidæ, having a short, strong bill, naked at the base; the upper mandible convex, bent down at the tip; the wings and tail short; the tarsi as well as the toes naked, the tarsi not spurred. The Common Partridge or Gray Partridge (*P. cinerea*) is the most plentiful of all game-birds in Britain, and becomes increasingly plentiful as cultivation is extended, whilst the range of the moorfowl is restricted. Hence it has

a, Common Partridge (*Perdix cinerea*); b, Red-legged Partridge (*P. rufa*).

greatly increased during the 19th century in Britain, and, though not preserved to the same extent as are pheasants, it affords considerable sport. It is not found in the Outer Hebrides. On the continent of Europe it is abundant in almost all districts suitable to its habits, from Scandinavia to the Mediterranean, and is found also in the north of Africa, and in some parts of the west of Asia. It varies considerably in size, those found in rich arable lands being generally the largest, and about 12½ inches in entire length, whilst those which inhabit poorer and more upland districts, or where heather abounds, are rather smaller. The female is rather smaller than the male. The upper parts of both are ash-gray, finely varied with brown and black; the male has a deep chestnut crescent-shaped spot on the breast, which is almost or altogether wanting in the female. A variety called the Mountain Partridge has the plumage brown. The Partridge is seldom found far from cultivated land. It feeds on grain and other seeds, insects and their larvæ and pupæ; and the pupæ of ants

are generally the food sought at first for the young. The nest is usually on the ground, among brushwood and long grass, or in fields of clover or corn, and generally contains from twelve to twenty eggs. The young run as soon as they are hatched. Both parents show a very strong attachment to their young, and great courage in repelling assailants; they have also recourse, like many other birds, to stratagem to draw off the most powerful and dangerous enemies, such as dogs, in another direction, fluttering close before them as if broken-winged, whilst the brood escape. Until the end of autumn the parent birds and their brood keep together in a *covey*; late in the season several coveys often unite into a *pack*, when it becomes much more difficult for the sportsman to approach them. The flight of the partridge is strong and rapid for a short distance, but it does not seem to be capable of a long-sustained flight. The eggs of partridges are often hatched, and the young birds reared, by the domestic hen, the chief requisite being a plentiful supply of ants when the birds are very young. Partridges thus reared become very tame, but they seldom breed in the aviary.

The Red-legged Partridge (*P. rufa* or *Caccabis rufa*, the genus or sub-genus *Caccabis* being distinguished by a rudimentary blunt spur on the tarsi) is a native of the south of Europe and of the Channel Islands, often called the French Partridge. It is now also plentiful in some parts of England, particularly Norfolk and Suffolk, into which it has been introduced, and whence it has largely driven out the common breed. It is said to have been brought to England from Guernsey during the reign of Charles II.; and the French Revolution of 1789, with its sudden abolition of the game-laws, is said by Carlyle to have caused 'two signs—emigrant flights of French seigneurs, emigrant winged flights of French game.' The red-leg is rather larger than the common partridge, stronger on the wing, and less easily approached by the sportsman, whilst it is also less esteemed for the table. The upper parts are of a reddish-ash colour; the throat and cheeks white, bounded by a collar of black, which expands in black spots on the breast; and the sides exhibit bars of black. The plumage is smooth. Two other species, nearly allied to this, are found in some of the southern parts of Europe. India has a number of species. The habits of all the species much resemble those of the common partridge, but the *P. rufa* prefers heavy clay land and heaths, in which respect it greatly differs from the gray partridge.—The name partridge is sometimes loosely used so as to refer to the North American species of Grouse (q.v.) and various species of *Ortyx* (see VIRGINIAN QUAIL), and in South America is sometimes given to the Tinamou (*Rhynchotus*).

Partridge Berry. See GAULTHERIA.

Partridge-wood, a very pretty hardwood from the West Indies and Brazil; the product of the leguminous tree *Andira inermis*. See ANDIRA.

Pasadena, a pretty country town in southern California, 10 miles by rail E. of Los Angeles. It has a great hotel with accommodation for 500 people, and a pop. of about 12,000.

Pasargadæ, one of the most ancient cities of the Persians, containing a palace and great treasures, was in the province of Persis, and stood in a plain surrounded by mountains, on the river Cyrus. It is identified with ruins near the modern Murghab, north-east of ancient Persepolis, and 70 miles north-east of the modern Shiraz.

Pascagoula, a navigable river in the south-eastern part of Mississippi, and formed by the junction of the Leaf and Chickasawha. It flows

85 miles south to a small bay of the same name on the Gulf of Mexico.

Pascal, BLAISE, one of the best writers and profoundest thinkers France has produced, was born of a good legal family, at Clermont-Ferrand in Auvergne, 19th June 1623. His father, Étienne Pascal, was a president of the Court of Aids there, and was himself a man of high character and capacity; his two surviving sisters, Gilberte and Jacqueline, grew up beautiful and accomplished women, with something of their brother's intellect and all his spiritual elevation of character. The elder of the two, Gilberte (born 1620), married her cousin M. Périer in 1641, penned a tender and touching sketch of her brother's life, as well as her sister's, and had her own history written by her gifted and austere daughter Marguerite (1646–1733). Jacqueline (born 1625) wrote verses as a child, and in maturer life remarkable letters and *Thoughts* on the 'Mystery of the Death of Christ.' After a troubled spiritual experience she became one of the sisters of Port Royal in 1652, but failed to find all the happiness she sought for, and died nine years later, immediately after having been persuaded into subscribing against her conscience the formula required from the Port-Royalists, which she had vehemently resisted as a treasonable betrayal of the cause. Her brother, at first willing to submit, now offered the strongest opposition to any further concessions, and, at an interview with Arnauld, Nicole, and Sainte-Marthe, argued the point with such vehemence that he fell fainting to the ground.

Their mother died in 1626 or 1628, and in 1630 their father went to live in Paris amongst the men of science of his time. He trained his gifted son with the greatest care, and Madame Périer has told us of the child's astonishing precocity, how he refused to rest without knowing the reason for everything, and how, when purposely kept from mathematical books, he worked out for himself at twelve the propositions of Euclid as far as the thirty-second in the first book. Still more, at sixteen he wrote a treatise on conic sections which called forth the mingled incredulity and astonishment of Descartes, and indeed forms the foundation of the modern treatment of the subject. It was never published, but Leibnitz saw it, and Pascal himself gave a résumé of it in his *Essai pour les Coniques* (1640). His father's protest against one of Richelieu's financial measures brought him into trouble, and indeed drove him awhile into hiding, but the cardinal's anger was abated by the intercessions of Jacqueline and her charming acting in a representation by young girls of Scudéry's *L'Amour Tyrannique*. Richelieu sent him as Intendant to Rouen in 1641, and here about 1646 an accident brought him into contact with the Jansenists, and turned into a new current the destinies of his children. Here the boy gave himself to study with unbroken devotion, despite wretched health and almost incessant sufferings from nervous prostration. To this period belongs his first conversion, and we find him in the intemperate zeal of a first love testifying to the earnestness of his convictions by denouncing to the archbishop the errors in the teaching of a Capuchin monk at Rouen. In 1647 he published his *Nouvelles Expériences sur le Vide*, and next year occurred his famous Puy de Dôme experiments on atmospheric pressure, which may be said to have completed the work of Galileo and Torricelli. The reputation he gained earned him the jealousy of Descartes, and the attacks of the Jesuit fathers of Montferrand and Paris.

His calculating machine was a brilliant achievement of the first years at Rouen; the later scientific labours of his life were contributions to the infinitesimal calculus, to the theory of the equilib-

rium of fluids, the mathematical theory of probability, and the properties of the cycloid. In the very last months of his life we find him busily engaged in a scheme for running omnibuses on the streets of Paris.

In the autumn of 1647 he returned to Paris, and we find him frequently accompanying Jacqueline in her visits to the church of Port Royal. Next year their father returned to Paris as Councillor of State, and took the pair to Clermont for nearly two years. In September 1651 he died, and Jacqueline, now free to carry out her desire, joined Port Royal in the January of 1652. From some of her exaggerated phrases Pascal has been needlessly supposed to have lived a worldly life with the Duc de Roannez and other friends, and his *Discours sur les Passions de l'Amour* has been interpreted as inspired by a hopeless passion for Charlotte Gouffier de Roannez, the duke's sister, then about sixteen years old. Certain it breathes a genuine passion throughout, and there can be little doubt that it was written out of some real experience. If Pascal did love her, it is most probable that he never told his love, for he continued to the close the warm friend and correspondent of herself and her brother alike. She vacillated awhile between the cloister and the world, passed through her novitiate at Port Royal, then married the Duc de la Feuillade, saw her children die and her own health decay, and early sank into the grave.

In the autumn of 1654 Pascal's second conversion occurred, and from this period date those severe and gloomy austerities which darkened his life and doubtless hastened him to the grave. The immediate occasion may have been a narrow escape from death through his horses running away when driving to Neuilly, but the moment that remained ever sacred in his memory was that of a remarkable vision or ecstasy, November 23, 1654, commemorated in a few broken sentences of impassioned and mystical devotion in his Profession of Faith, or Amulet, as Condorcet called it, which was found after his death, copied in his own handwriting both on paper and parchment, and sewn into his doublet, being apparently stitched anew into every change of clothes. (See, but only for its facts, Lélut's *L'Amulette de Pascal*, 1846.) From this time a complete change passed over his life; he subjected himself to the most rigid mortifications, complete denial of self, boundless charity, and absolute obedience to his spiritual director, and ever wore around his body a girdle of iron, the sharp points of which he would press into his flesh when he felt in danger from worldly temptations or wandering thoughts. For a time he lived in Port Royal, and henceforth he threw himself with a passionate devotion into its cause. Arnauld was condemned by the Sorbonne in 1655, not merely for doubting whether the famous Five Propositions condemned were actually contained in the work of Jansen, but also for asserting the identity of the Augustinian and Jansenist doctrines of *gratia efficax*, and for declaring that the arguments used against the *Augustinus* were themselves erroneous or falsified; and his friends now thought the time had come for the public to be informed about the whole question at issue.

In a happy hour Pascal was induced to lend his pen to the cause, and on the 23d January 1656, in the interval between the first and second judgment of the Sorbonne on Arnauld, appeared *A Letter written to a Provincial by one of his Friends*. A second was issued a few days later, and as its successors followed he assumed the pseudonym of 'Louis de Montalte.' These 'little letters'—the greatest tracts for the times that were ever issued—flew from hand to hand, and the rage and fury of the Jesuits knew no bounds. Never before had

been seen in the whole range of controversy such delicate yet scathing irony, such lightness of touch yet keenness of thrust, such Socratic directness and point, such mastery of incisive argument wedded to perfect grace and felicity of phrase and rare distinction of style. 'The best comedies of Molière have not more wit than the first Provincial Letters,' says Voltaire, and he adds, 'Bossuet has nothing more sublime than the concluding ones.' Voltaire tells us that Bossuet himself confessed that had he not written his own, he would rather have written them than any other book he knew; even Madame de Sévigné bowed her head before their sovereign delicacy and perfection of style; Boileau owned them unsurpassed in ancient or modern times; Perrault places them above Plato for wit, Lucian for delicate and artful railery, and Cicero's orations for strength and ingenuity of reasoning; and Gibbon tells us that almost every year he perused them with fresh pleasure, and from them learned 'to manage the weapon of grave and temperate irony, even on subjects of ecclesiastical solemnity.' There are altogether eighteen Letters from the pen of Pascal himself, a brief fragment of a nineteenth ascribed to him, and a twentieth on the Inquisition from the pen of M. Le Maître. The first two deal with the special question between Arnauld and the Sorbonne; the third and two concluding letters are closely connected with these; the intervening thirteen (4-16) open up the whole subject of the moral theology of the Jesuits, and form the most formidable attack ever made upon the order. The fabric of the moral theology or casuistry of the Jesuits, with all its subtle equivocations and refinements for the extenuation of sin, appalled the austere soul of Pascal as he read into it; and by the end of the tenth letter, after completing his exposition of their theology, he turns to address the Jesuit fathers directly, and breaks into language of eloquent and indeed sublime denunciation. The eleventh defends the application of the method of railery to serious subjects; the twelfth and thirteenth rise to an eloquence equalled only in Demosthenes; the sixteenth is that the length of which he excuses because he had not had time to make it shorter. In the composition of his Letters Pascal owed much to the materials collected in the Port Royal work, *La Théologie Morale des Jésuites* (1644). His quotations were confessedly often furnished for him from the wider reading of friends like Nicole and Arnauld, but he tells us that he himself read Escobar's seven volumes twice through, and never made use of a single passage supplied to him without having specially examined it and its context. It has been charged against him that he sometimes quotes inaccurately, and that he is unfair in taking quotations out of their setting, but the real grievance of his adversaries is nothing more than this, that he turns their flank by taking their own positions and developing them practically to their natural conclusions. And if it be said that he treated with too great seriousness the statements and arguments of inferior writers, it must be remembered that all these books were issued under the *imprimatur* of the order. At anyrate the Jesuits were much readier with denial and denunciation than counter-arguments and proof; the replies of Pirot (1657), Daniel (1694), and Dumas (1700) were pitiful failures, and hardly more can be said of the onslaught of Joseph de Maistre (in *De l'Eglise Gallicane*, 1821) and of the Abbé Maynard's edition of the Letters with a professed refutation (1851). Pascal's own final judgment of his work was expressed in these solemn words: 'Though my Letters be condemned at Rome, what I condemn in them is condemned in Heaven. Ad tuum, Domine Jesu, tribunal appello.'

Between his conversion and the beginning of his

great controversy Pascal seems to have lived chiefly at Port Royal under the spiritual guidance of M. de Sacy, but he never took up his abode as a regular inmate there. His Letters occupied him till the spring of 1657, and during the following year he busied himself in a scheme for a great Apology of religion, his faith meanwhile being quickened by his belief in the famous Miracle of the Holy Thorn, according to which his niece, Marguerite Périer, a pupil at Port Royal, had been miraculously cured of an obstinate *fistula lacrymalis* by a touch of a fragment of the crown of Christ. But his health gave way during 1658, and thenceforward to the close he bore the burden of constant suffering with more than saintly patience and resignation. Indeed he laboured to deaden every sensation of pleasure in life, in his food, his studies, and even the affections of his friends. Meanwhile his weakness grew upon him, study and composition became possible only in brief intervals, and on 19th August 1662 he sank to rest under his sister's roof at Paris, his own house having been given up to a poor family one of whose children had been seized with smallpox.

Seven years later (1669) appeared his *Pensées*, with a preface by Madame Périer's son—the result of the editorial labours on his fragmentary papers of a committee of influential Jansenists. Unhappily these perplexing fragments were garbled to a great extent in the interests of orthodoxy and ecclesiastical policy by exaggerated prudence and misdirected zeal, just as they were in 1776 by Condorcet in the interests of heterodoxy. The Abbé Bossut's edition in 1779 was long accepted as authoritative; but in 1842 Cousin first showed the real state of the case in his celebrated Report to the French Academy, and startled the world by declaring that Pascal was a complete sceptic in philosophy, and a Christian only through external influences entirely unconnected with logic or reason. To M. Prosper Faugère belongs the honour of first giving (1844; Eng. trans. by Pearce, 1850) a complete and authentic text, although all readers will not accept his supposed discovery of the indications of an interior arrangement. Havet, in his edition (1852; 2d ed. 1866), thinks it hopeless to discover the true order, and therefore returns to Bossut's arbitrary but familiar arrangement. Victor Rochet, again (1873), adopts an elaborate arrangement, professedly founded on Pascal's original plan, and maintains that everything falls naturally into it. The best edition is that of M. Molinier (2 vols. 1877-79), an independent arrangement mainly on the lines of Faugère's. It is this last version which has been admirably translated into English by C. Kegan Paul (1885).

Pascal's *Pensées* are detached thoughts dashed rapidly off, intended as materials to be shaped into his projected Apology for the Christian faith. They are thrilled through and through with passionate emotion and ever-present personality, and they contain some of the most profound, suggestive, and startling thoughts that have ever been expressed on the greatest mysteries within the range of human speculation. From one point of view it is easy to construct from them, as Cousin did, a theory that their author was a pessimist and sceptic of a far deeper dye than Montaigne, but profounder study proves this view but a shallow paradox at best. The conversation with De Sacy (first published in 1728 by Des Molets) offers the best key to Pascal's philosophy of life. Here he takes Montaigne and Epictetus as his representatives, the first of the Pyrrhonist, Epicurean, and sceptic, who mocks man's aspirations after spiritual truth, and insists upon his weakness, his ignorance, and doubt; the second, of the Stoic, who looks at man only on his lofty side, insists on his freedom and moral dignity, and points out in his moral nature the image and likeness of God. Pascal regards these two opposites as united in the gospel of Christ, the overwhelming certainty of which arises out of its alone affording a key to the tormenting anomalies and contradictions of nature,

at once to the moral law as revealed by conscience within and to all the disorder of the world as discovered by conscious experience—to man's greatness and man's degradation, and the reason for both the one and the other. Man's spiritual capacity alone enables him to realise his intrinsic greatness, which was revealed to him once for all when for his sake the Highest was joined to the lowest, in the incarnate union of Divine Power and Love with human degradation and pain. This is a mystery beyond man's power of demonstration, and a deeper ground for certainty must be sought in its essential correspondence, not with the intellect alone, but with the whole complex nature of man. Yet with all this there exist in the *Pensées* startling fragments deeply tinged with scepticism, although many of these may be interpreted with Sainte-Beuve as a kind of shorthand notes to fix ideas that flashed across his mind of difficulties to be afterwards considered. Of these none is more famous than the wager essay, in which, as has been said, and with truth, Pascal plays at pitch and toss with the existence of God and the immortality of the soul. Such a passage as this is a product, says Tulloch, of one of those 'moments of terrible doubt, when the soul is so borne away on the surge of the sceptical wave that rises from the depth of all human speculation that it can only cling to the Divine by an effort of will, and with something of the gamester's thought that this is the winning side.' The *Pensées* owe much to Montaigne and Charron, and, as Molinier has shown, to the 13th-century Spanish writer Raymond Martin.

The only complete editions of Pascal's works that need be mentioned are those of Bossut (1779), Lahure (1858), and Faugère (8 vols. 1886 *et seq.*). Of the *Provincial Letters*, besides the Abbé Maynard's edition (1851) already mentioned, and M. Lesieur's reprint of the original quarto (1867), there are editions by Villemain (1829), De Sacy (1877), De Soyres (Lond. 1880), L. Derome (1885 *et seq.*), and Molinier (2 vols. 1891). The famous Latin translation by Wendrock [Nicole], for which he read his Terence thrice over, appeared at Cologne as early as 1658. There are English translations by Royston (1657), Pearce (1849), and Dr McCrie (1846). Of the *Pensées* there are editions by Frantin (1835), Faugère (1844, containing what seems to be the most authentic portrait), Havet, with an admirable commentary (1852; 3d ed. 1881), Lahure (1858), Louandre (1854), Rochet (1873), and Molinier (1877-79). English translations are those by Walker (1688), Craig (1825), Pearce (1850), and Kegan Paul (1885). For Jacqueline Pascal's Life, see the works by Cousin (1845) and Sophy Winthrop Weizel, *Sister and Saint* (New York, 1880). Her miscellaneous writings, letters, and poems, together with those of Madame Périer and Marguerite Périer, were edited by Faugère (Paris, 1845).

See vols. ii. and iii. of Sainte-Beuve's *Port Royal* (1842-48), and Charles Beard's *Port Royal* (1861); the studies by Reuchlin (Stutt. 1840), Vinet (1856), Cousin (1857), H. Weingarten (Leip. 1863), Dreydorff (admirable, Leip. 1870), Tulloch, in 'Foreign Classics' (1878), and Joseph Bertrand (1891). Admirable articles on Pascal are those in the *Edinburgh Review* for January 1847 (by Henry Rogers), the *Quarterly Review* for October 1879, the *British Quarterly Review* for October 1884 (by C. Kegan Paul), and Dean Church in *Companions for the Devout Life* (1875). See also the articles ARNAULD, JANSEN, and PORT ROYAL in this work.

Paschal. See PASSOVER, EASTER, HOLY WEEK.

Pasco. See CERRO DE PASCO.

Pas-de-Calais (Fr. for Strait of Dover), a department in the north of France, formed out of Artois and Picardy, and bounded on the W. by the Strait of Dover and the English Channel. Area, 2550 sq. m.; pop. (1861) 724,338; (1886) 853,526. The surface is level, with the exception of a low ridge running to the north-west, and ending in

Cape Gris-nez (q.v.). The soil is fertile, mostly under cultivation, and watered by numerous short rivers, the majority of which are navigable and connected by canals. The coast-line is 80 miles in length, and the shores are in certain parts low and sandy. The climate is exceedingly inconstant. Fishing is actively carried on, particularly in the neighbourhood of Boulogne. Coal, iron, and other minerals are raised and worked, and considerable quantities of turf are cut. The industrial establishments are numerous and important, as iron-foundries, beet-root sugar factories, glass-works, potteries, tanneries, and others. Boulogne and Calais are the principal harbours. There are six arrondissements—Arras, Béthune, St Omer, St Pol, Boulogne, and Montrenil. The capital is Arras.

Paseng. See GOAT.

Pasewalk, a town of Prussia, 26 miles by rail WNW. of Stettin, has varied industries. It was plundered and burned three times by the Imperialists in the Thirty Years' War, by the Poles in 1657, and by the Russians in 1713. Pop. 9514.

Pasha' (spelt also *pacha* and *bashaw*), a title, derived from the Persian, used in the Ottoman empire, and applied to governors of provinces, or military and naval commanders of high rank. The title was limited in the early period of the Ottoman empire to the princes of the blood, but was subsequently extended to great officers of the empire. The three grades of pashas used to be distinguished by the number of the horse-tails—three, two, or one—borne before them as their standards. This antique system was abolished by Mahmud II., but the three ranks still survive. Every general is *ex-officio* a pasha, so is every vali or governor of a province. The Sheikh-ul-Islam, on the other hand, is never a pasha, but only an effendi.

Paskevitch, IVAN FEODOROVITCH, Count of Erivan and Prince of Warsaw, a Russian field-marshal, was born at Poltava, May 19, 1782. He was educated in the school of pages, entered the army, served against the French in the campaign in 1805, which was ended by the defeat of Austerlitz, and afterwards against the Turks. Then he took a prominent part in the campaign of 1812, especially in the battles of Smolensk, Borodino, Leipzig, and in the capture of Paris. In 1826 he was appointed commander-in-chief against the Persians, whom he completely defeated, conquering Persian Armenia, taking Erivan, and ending the war by a peace (1828) exceedingly favourable to Russia. In recompense for these services he was created Count of Erivan, and received a grant of £100,000. In 1828 and 1829 he made two campaigns against the Turks in Asia, took Kars, Erzerûm, and other fortresses, and terminated the war by the treaty of Adrianople in 1829. In 1831 he suppressed the rising in Poland by capturing Warsaw, and was made governor of the reconquered country. Under his rule Poland was (1832) definitively incorporated as Russian territory. When the Hungarians took up arms in 1848 Paskevitch was sent to the assistance of Austria, and, after defeating the Hungarians in several battles, compelled Görgei to surrender at Vilagos (1849). In 1854 he took command of the Russian army on the Danube; but fortune, which had hitherto invariably smiled upon him, deserted him at Silistria, where he was wounded. Thereupon he resigned the command, retired to Warsaw, and died 1st February 1856. See Life by Tolstoi (Paris, 1835), and Schterbatoff (St Petersburg, 1888), both in French.

Pasque Flower. See PULSATILLA.

Pasquinade, an anonymous or pseudonymous publication of small size, sometimes printed, sometimes only posted up or circulated in manuscript, and having for its object the defamation of a character, or at least the turning of a person to ridicule. The name is derived from *Pasquino*, a tailor remarkable for his wit and sarcastic humour, who lived in Rome towards the close of the 15th century, and attracted many to his shop by his sharp and lively sayings. Some time after his death a mutilated fragment of an ancient statue, considered to represent Menelaus supporting the dead body of Patroclus, was dug up opposite his shop, and placed at the end of the Braschi Palace, near the Piazza Navoni. It was named after the defunct tailor, and the practice originated of affixing to it placards containing satires and jests relative to the affairs of the day—the pope and the cardinals being favourite victims of the invisible satirists. See a French monograph by Mary Lafon (2d ed. 1877).

Passage, BIRDS OF. See BIRD, Vol. II. p. 172.

Passaglia, CARLO, a Catholic theologian, was born of humble parents at Lucca, 2d May 1812, was trained a Jesuit, and in 1844 became professor in the Collegio Romano. He was eminent alike for his learning and eloquence. During the troublous times of 1849–51 he taught in a Jesuit college in England. In 1855 he published an elaborate treatise on the doctrine of the Immaculate Conception, but ere long he resigned his chair, and in 1859, leaving the Society of the Jesuits, entered warmly into the discussions as to the temporal power of the pope, and wrote a famous pamphlet, *Pro Causa Italica ad Episcopos Italianos*. The result was that he had to withdraw to Turin, where he edited the *Mediatore* and became professor of Moral Philosophy. At Turin he died, 12th March 1887.

Passaic, a city of New Jersey, on the Passaic River, 11 miles by rail NW. of Jersey City. Besides foundries and print-works, it has manufactories of woollens and shoddy, whips, india-rubber, chemicals, &c. Pop. (1880) 6532; (1890) 13,028.

Passamaquoddy Bay, in North America, opens out of the Bay of Fundy, at the mouth of the St Croix River, between Maine and New Brunswick. It is 15 miles long by 10 wide, and shut in by a cluster of islands so as to form an excellent harbour.

Passarowitz, or more correctly POSHARE-WATZ, a town of Servia, 9 miles S. of the Danube and 40 SE. of Belgrade. Pop. 9394. Here was signed, July 21, 1718, the treaty between Venice and the emperor, on the one side, and the Porte on the other, by which a truce of twenty-five years was established, and the Banat of Temesvar, the western portion of Wallachia and Servia, Belgrade, and part of Bosnia were secured to Austria.

Passau, a town of Bavaria, stands on a rocky tongue of land, on the right bank of the Danube, beside the influx of the Inn, and opposite the confluence of the Ilz with the Danube, close to the frontier of Austria, and 72 miles by rail SE. of Ratisbon. The city proper is connected with its suburbs on the other side of the Inn and the Danube by means of iron bridges; and picturesque hills encircle the whole town. The cathedral was rebuilt after a fire in 1680; the bishop's palace is now in part converted into public offices. The Passau Agreement between the Roman Catholic and Protestant estates of the empire was signed here on 29th July and 15th August 1552. Passau was long an important fortified post, being looked upon as the key of the Danube in that part of its course. There were two strong citadels, one dating from 737, the other from 1215–19, besides other fortified works. The town grew up around an old Roman camp.

and in 739 was made the seat of a bishopric founded by St Boniface. The town came into the hands of Bavaria in 1803. It has important manufactures of leather, porcelain, and parquet-floors, besides boats, metal-ware, and mirrors, and considerable trade in salt, timber, corn, and Passau tiles (made at Oberzell). Pop. 15,583.

Passenger Pigeon (*Ectopistes migratorius*), a species of pigeon, a native of North America. The

Passenger Pigeon
(*Ectopistes migratorius*).

genus to which it belongs has the head small, the bill short, the tail very long and wedge-shaped, the wings long and pointed. The male of the passenger species, generally known in North America as the Wild Pigeon, is about 16½ inches long, the tail increasing the length to 25 inches. The colour is grayish blue above, breast and sides reddish brown, rest of the under parts white. The female is smaller and duller coloured than the male. They migrate at irregular intervals in enormous flocks (of many millions at times) seeking for food, and are killed in large numbers, their flesh being dark coloured, but good eating. The passenger pigeon is found throughout temperate North America.

Passeres (Lat. *passer*, 'sparrow'), the name given by Cuvier to the order of birds otherwise called Insectores, comprising more than half of all the birds. As the order has no well-marked characters, sparrow-like or other, common to all its members, neither name is prominent in newer classifications. See BIRD, Vol. II. p. 173.

Passionflower (*Passiflora*), a genus of plants almost exclusively natives of the warm parts of America, and belonging to the natural order Passifloraceæ. The flowers are hermaphrodite, with a coloured calyx, generally of five segments; the corolla also of five segments or wanting; always having a more or less conspicuous crown of filaments springing from the throat of the tube formed by the base of the calyx and corolla. The stamens are five, inserted in the tube of the calyx, united in a tube to near the apex, where they divide, and are surmounted by the much-reflexed anthers. The ovary is one-celled, elevated on a stalk, surmounted by three thick styles with thick clove-like stigmas. The fruit is fleshy. This genus has received its name from fanciful persons among the first Spanish settlers in America imagining that they saw in its flowers the emblems of our Lord's passion; the filamentous processes being taken to represent the crown of thorns, the nail-shaped styles the nails of the cross, and the five anthers the marks of the wounds. The species are mostly half-shrubby evergreen or stove climbers, of rapid growth; and most of them have lobed leaves, with from two to seven lobes. The flowers of many are large and beautiful, on which account they are often cultivated in hothouses. Some of the species are also cultivated in tropical countries for their fruit, particularly those of which the fruit is known by the

name Granadilla (q.v.). The apple-fruited Granadilla or Sweet Calabash of the West Indies is the fruit of *P. maliformis*, which is about two inches in diameter, containing within a hard stringy shell an agreeable gelatinous pale yellow pulp. *P. quadrangularis* is the common Granadilla, a native of Jamaica and South America, but is cultivated in all parts of tropical South America, and occasionally in hot-houses in Britain for the sake of its fruit. The fruit is oblong in shape, often six inches in diameter transversely. The skin when ripe is greenish yellow in colour, thin, but tough and leathery, and contains a very succulent pulp of a purple colour which is sweet and slightly acid. It is generally eaten with wine and sugar. The root of the plant is poisonous, owing to the presence of an active principle called *passiflorine*, the properties of which are similar to morphine. The laurel-leaved Granadilla is *P. laurifolia*, the fruit of which is named *Water-lemon* by the English and *Pomme de Liane* by the French in the West India Islands. It grows to about the size of a hen's egg, becomes yellow, dotted over with white when ripe, and contains within the tough thin rind a whitish sweet watery pulp, delicately aromatic and slightly acid. It quenches thirst, allays heat, and induces appetite. *P. incarnata*, a species with herbaceous stems, a native of the warm parts of South America, produces an edible orange-coloured fruit about the size of an ordinary apple. The fruit of *P. edulis* is about two inches long and slightly less in diameter, assuming a livid purple colour when ripe, and contains an orange-coloured pulp with the flavour of a somewhat acid orange. The fruit of some species of passionflower, however, is not only uneatable, but fetid; and the roots, leaves, and flowers of some have medicinal properties, narcotic, emmenagogue, anthelmintic, febrifugal, &c. The hardiest species, the Blue Passionflower (*P. cœrulea*), grows well enough in some parts of France, and even in the south of England.

Passionflower (*Passiflora cœrulea*).

Passionists, a religious congregation of priests of the Roman Catholic Church, the object of whose institute, indicated by their name, is to preach 'Jesus Christ and him crucified.' The founder, St Paul of the Cross, was born in 1694 near Genoa, obtained the sanction of Benedict XIV. in 1741, and died at the mother-house of the society on the Cœlian Hill at Rome in 1775. The cross appears everywhere as their emblem, and a large crucifix forms part of their very striking costume. They practise many personal austerities, and their ministerial work consists chiefly in holding what are called 'missions' wherever they are invited by the local clergy, in which sermons on the passion of Christ, on sin, and on repentance, together with the hearing of confessions, hold the principal places. For a time the congregation remained in obscurity; but in the first half of the 19th century

it rose into notice. In 1842 it secured a footing in England, whose conversion had been the founder's special aim, and in which there are now five houses; there are two in Ireland and one in Scotland. The American province, begun in 1852, numbers between one and two hundred religious houses. There are many Passionist fathers in Bulgaria and Roumania, in Belgium and New South Wales.

Passion Music. See ORATORIO.

Passion Play. See MYSTERIES.

Passion-Week, the name commonly given in England to the week immediately preceding Easter, and otherwise called Holy Week (q.v.). But, by the proper rubrical usage, Passion-Week is that which precedes Holy Week, commencing on Passion Sunday, the fifth Sunday of Lent. In the Roman Catholic Church, with this Sunday begins the more solemn part of Lent, and during the succeeding fortnight the *Gloria Patri* is omitted at the Introit, and all pictures, crucifixes, statues, and other sacred representations are veiled.

Passive Obedience. See DIVINE RIGHT, BODIN, FILMER.

Passover, a well-known feast of the Jews. The English word *passover* is a translation of the Hebrew *pesach*, which in Aramaic with the post-positive article becomes *pascha*; whence the Greek, Latin, and various Romance forms of the word. The original meaning of the verb may perhaps be traced in 1 Kings, xviii. 26, where it is rendered 'leap' or (revised version margin) 'limp,' and suggests a religious dance. The root occurs in Tiphisah (1 Kings, iv. 24) or Thapsacus, an important ford or ferry over the Euphrates. The Passover is one of the oldest recurrent sacrifices of the Hebrews; an account of its origin is given in Exod. xii.; famous celebrations of it are described in 2 Chron. xxx., xxxv., and Ezra vi.; and the laws and regulations relating to it will be found in Exod. xii. 1-51, xiii. 3-10, xiii. 14-19, xxxiv. 18-26, Lev. xxiii. 4-14, Num. ix. 1-14, xxviii. 16-25, Deut. xvi. 1-8. These laws were formerly held to be all practically contemporary pieces of legislation; but they are now known to be of very various dates and to relate to widely-different religious and social conditions (see PENTATEUCH). In all of them the Passover is intimately associated with the Feast of Unleavened Bread; but the latter is essentially an agricultural festival, and the earliest origin of the Passover must doubtless be sought in the times when the Israelites were still a purely nomadic and pastoral people, and gave religious expression to their thankfulness for the annual increase of their flocks and herds by sacrifices 'of the firstlings of the flock and the fatlings thereof' (Gen. iv. 4). The recollection of such an annual festival, which would naturally be held in spring, survives in the Jehovistic narrative of the events preceding the exodus, which largely turned on the refusal of Pharaoh to allow the people to go out into the wilderness to sacrifice. It was, we infer, a nocturnal lunar feast, held at the spring full moon, and this character it retained throughout; it consisted of the firstlings of the flock and of the herd, and even as late as the close of the 7th century B.C. the victim was not necessarily a lamb (Deut. xvi. 2; cf. 2 Chron. xxxv. 7: 'lambs, kids, bullocks'). With the settlement of the Israelites as an agricultural people in Canaan, the agricultural festivals, marking the various stages of harvest and ingathering, naturally gained in prominence, and the pastoral Passover came to be more and more closely associated with a harvest feast which also fell in spring—that of unleavened bread—when after the presentation of the first sheaf before Jehovah the people entered at once upon the enjoyment of the new corn, without waiting for the

tedious process of leavening their dough. The usages of the various local and domestic sanctuaries in the land were made uniform (Deut. xvi. 1-16) by the promulgation of the law of one exclusive place of worship. Of subsequent modifications made on the Deuteronomic code by the Priestly legislation the most interesting perhaps are the stricter definition of the kind of victim, the substitution of roasting for 'boiling' (see Deut. xvi. 7, revised version margin), and the interpolation of an additional day into the accompanying feast (Deut. xvi. including the Passover in the seven days of unleavened bread, while Numbers xxviii. counts the seven days from the 15th, not the 14th, of the month).

The celebration of the Passover in later times had public and official aspects which were invested occasionally at least with great pomp and ceremony, as may be gathered from the descriptions already referred to in Chronicles and Ezra; but, just like great ecclesiastical functions in our own day, it also had its private and domestic side. From Talmudic sources we gather a good deal that is of interest as to Passover customs in connection with the life of Jesus and the last supper. The company for a single lamb varied from ten to twenty; first the cup of consecration, over which the master of the house had pronounced a blessing, was drunk; then hands were washed and the meal served, consisting of bitter herbs, cakes of unleavened bread, a sauce called *haroseth*, made from dates, raisins, and vinegar, the paschal lamb, and the flesh of subsidiary (Deuteronomic) sacrifices. The master of the house dipped a morsel of unleavened bread into the *haroseth*, and ate it, and a similar 'sop' was given to every one present. Afterwards the paschal lamb was eaten, and three other cups of wine were drunk at intervals with thanksgivings and singing of the Hallel (Psalms cxiii.-cxviii.). To the Jews of the Dispersion the Passover, together with the Feast of Unleavened Bread, has always had great importance, though the lamb, not being slain at the Temple, is not regarded as strictly the paschal lamb of the law.

That the paschal lamb typified Christ is taught by Paul (1 Cor. v. 7), and also by the author of the fourth gospel (John, xix. 36), who, as is well known, represents the crucifixion as having taken place at the time of the Passover, and attaches importance to the fact.

For the history of the Passover in its bearings on Old Testament criticism, see Wellhausen's *History of Israel* (1885), Dr W. H. Green's *Hebrew Feasts* (New York, 1885), and other works cited under PENTATEUCH and BIBLE. For later Jewish practice, see Bartolocci's *Bibliotheca Rabbinica* or Bodenschatz's *Kirchliche Verfassung der Juden*.

Passow, FRANZ, scholar, born at Ludwigslust in Mecklenburg, 20th September 1786, was educated at Gotha and Leipzig, and in 1815 became professor of Archaeology at Breslau, in 1829 director also of the museum of art there. He died 11th March 1833. His *Handwörterbuch der griechischen Sprache* (1819-24; 5th ed. 1841-57) is the work that preserves his memory, and formed the basis of Liddell and Scott's *Greek Lexicon*. See his *Life* by Wachler (Bresl. 1839).

Passport, a warrant of protection and permission to travel, granted by the proper authority, to persons moving from place to place. Passports are sometimes issued by the ministers and consuls of the country which the traveller intends to visit, which cannot, however, be done without the consent or connivance of the state of which the holder of the instrument is a subject; they properly proceed from the authorities of the state to which the traveller belongs, and ought to bear the *visa* or countersignature of the minister or consul of the country which he is about to visit. In some

European states no one is allowed to go abroad without a passport from his government authorising him to leave the country—a provision used as a means of detaining persons charged with crime; and passports are even required by the natives to enable them to go from place to place in their own country. The regulations of different states have varied much regarding the use of passports; and of late years there has been a great relaxation of the stringency of the regulations connected with them. Sweden was the first country to give up demanding passports in time of peace; Russia and Turkey still insist on them; sometimes, as during anti-socialist excitements, German authorities demand passports from foreigners not travelling, but wishing to reside for a period of weeks in any given place; Portugal asks them of persons leaving the country by sea; and on the French and German frontiers the neighbour-governments are specially inquisitorial. Within the United Kingdom no passports are required; but for a British subject travelling in some parts of the Continent they are still requisite. Even where not necessary, they are often useful in order to prove identity—in asking for letters at a foreign post-office, for example. At some of the German universities the production of passports and other 'papers' is required of all foreign students matriculating. The passport most used by British subjects is that of the British Secretary of State for Foreign Affairs, which is now granted to any British subject for a fee of two shillings, and is good for life. If the applicant be not personally known to the Secretary of State, he must either be recommended to him by some person who is known to him, or produce an application in his favour by some banking firm established in London or elsewhere in the United Kingdom, or a certificate of identity signed by a mayor, magistrate, justice of the peace, minister of religion, physician, surgeon, solicitor, or notary resident in the United Kingdom. In certain cases the production of a certificate of birth may be required. If the applicant be a naturalised British subject his certificate of naturalisation must be forwarded to the Foreign Office.

In time of war passports or safe-conducts may be granted in special cases by neutral powers, to protect persons and property from belligerents, and by a belligerent to protect from interference by its own ships or forces.

Passy, a western suburb of Paris (q.v.).

Pasta, GIUDITTA (JUDITH), opera singer, was born of Jewish parents, Negri by name, at Como near Milan, 9th April 1798, and received her musical education at Como and in the conservatoire at Milan. She married a singer called Pasta before 1816, and was at first a failure on the stage. Her first great triumph was achieved at Verona in 1822, seven years after she began to sing. The year following she was engaged at the Paris Italian Opera, where her singing excited great admiration. From 1825 to 1833 was the period of her most splendid triumphs, which were won principally in London and Paris. She withdrew from the stage in the following year, and resided on the banks of Lake Como till she died on 1st April 1865. She had a magnificent voice, which passed easily from the highest soprano notes to the gravest contralto tones. In addition she possessed fine dramatic power. Her principal rôles were Medea, Desdemona, Semiramide, La Sonnambula (the opera of this name was written for her by Bellini), Nina, Camilla, and Giulia in *Romeo e Giulia*.

Pasteboard. See CARDBOARD, MILLBOARD, STRAWBOARD.

Pastel, chalk mixed with other materials and various colours, and formed into Pencils or Crayons

(q.v.). Drawings with such dry, coloured crayons may be made on paper or parchment, and have been especially used in portraiture.—Pastel is also a name for Woad (q.v.).

Pastes. See GEM.

Pasteur, LOUIS, distinguished for his researches in chemistry and pathology, and more precisely for many discoveries in regard to bacteria, was born on 27th December 1822, at Dôle in the department of Jura. From the college of Arbois he passed to Besançon, and thence to the Ecole Normale and the Sorbonne in Paris. After the completion of his preparatory studies he held various academic positions at Strasburg, Lille, and Paris, where in 1867 he became professor of Chemistry at the Sorbonne. Since 1886 the centre of his work has been at the Pasteur Institute in Paris. His work was at first chemical. Following up well-known researches by Arago, Biot, and Mitscherlich, Pasteur discovered the facets on tartrate crystals and what are called left-handed tartrates. He also propounded the theory that 'molecular dissymmetry'—supposed to be expressed in the power which solutions of some organic substances have of causing a beam of polarised light to rotate—was characteristic of living matter and its products.

It is said that a German manufacturer of chemicals noticed that impure tartrate of lime fermented when dissolved and exposed in the sun, and that this prompted Pasteur to an investigation, the result of which was the discovery of a living ferment—a micro-organism comparable in its powers to the yeast-plant which Cagniard-Latour and Schwann had discovered in alcoholic fermentation. Pasteur was further able to show that the little organism would, in a solution of paratartrate of ammonia, select for food the 'right-handed' tartrates alone, leaving the 'left-handed', although the difference between these is merely physical not chemical. Having got hold of a clue, Pasteur went on to show that other fermentations—lactic, butyric, acetic—are essentially due to organisms. He was naturally led to corroborate and extend Schwann's researches on putrefaction, which is also due to micro-organisms, and this path of investigation enabled him to make important practical suggestions in regard to the making of vinegar and the prevention of wine disease, as also to correct insufficiently careful experiments which were leading many to believe that spontaneous generation was demonstrable.

Prompted by his illustrious master Dumas, Pasteur next (1865) directed his inquiries to those diseases of silkworms by which the silk industry in France had been almost ruined. It is said that he had never before even seen a silkworm, though he knew the supposed disease-germs which had been demonstrated by previous investigations in the insect's blood. These he traced from egg to larva, from chrysalis to moth; and, as the pébrine disease is distinctly manifest in the adults, though it may be hidden in the young, the practical conclusion was plain that unhealthy moths should be rejected, and that all precautions should be taken to prevent infection. But Pasteur's work on the diseases of silkworms overstrained him, and in 1868 he was laid aside by paralysis. Soon, however, he was at work again, investigating beer as he had investigated wine, detecting the intruders which sometimes interfere with the life of the yeast-plant and spoil the brew. His researches began to come yet closer to human life, for he attacked the problem of splenic fever, the bacillus of which had been discovered by Davaine (1863), and skillfully traced from stage to stage by Koch (1876). Of Pasteur's investigations in this connection, that by which he showed that birds were not liable to fall

victims to splenic fever, because the temperature of their blood is too high for the prosperity of the germ, may serve as a characteristic illustration. Passing from splenic fever to fowl cholera, Pasteur showed that it was possible to attenuate the virulence of injurious micro-organisms by exposure to air, by variety of culture, or by transmission through various animals. He thus 'tamed' the bacillus of splenic fever, and demonstrated by a memorable experiment that sheep and cows 'vaccinated' with the attenuated bacilli were protected from the evil results of a subsequent inoculation with the virulent virus. Pasteur's subsequent researches in regard to hydrophobia are discussed in the article on that subject. We have by no means mentioned all that Pasteur's rapid industry and experimental genius have achieved, but sufficient illustration has been given of the splendid series of discoveries by which he has enriched science and benefited humanity.

See the *Life* by his son-in-law, translated from the French by Lady Claud Hamilton, with an introduction by Professor Tyndall (1885).

Pastille (diminutive of *paste*) originally applied to lozenges as little portions of confectionery paste, but it has been of late chiefly confined to a mixture of odorous materials, as in the case of the *fumigating pastilles*, which are burned either as incense or as a means of diffusing an agreeable odour. They are composed of charcoal powder, with such aromatic gums as benzoin, ladanum, &c., and powders of sweet-scented woods and barks, as sandalwood, cinnamon, and especially cascarilla barks. Essential oils are also added, and the whole are worked into a paste with a little gum-mucilage, and formed into small sharp-pointed cones about an inch and a half high, and half an inch broad at the base. When perfectly dry they are used by lighting at the point, and as they burn down an agreeable odour is given out with the smoke. Another kind of pastille, usually in the form of a small pill covered with gold or silver leaf, is used for perfuming the breath; it is made of similar ingredients, excepting the charcoal.

Pasto, a town in the south-west of Colombia, in a fertile valley 8350 feet above sea-level. Above it rises the volcano of Pasto (14,000 feet above the sea); and in 1827 the town was destroyed by an earthquake. It manufactures cloth. Pop. 10,000.

Paston Letters, a collection of over a thousand letters and papers, mostly written by or to particular members of the Norfolk family of Paston, and covering almost the whole 15th century (1422-1509). They are of especial value as giving a glimpse into the life of England during the Wars of the Roses. The family took its name from the village of Paston, near the sea, about 20 miles N. of Norwich, and gradually grew upwards out of the condition of the smaller gentry of Norfolk. Its most famous members were William Paston, Justice of Common Pleas under Henry VI.; his son John, executor to the famous Sir John Fastolf; Clement Paston, a brave sailor under Henry VIII.; Sir Robert Paston, created under Charles I. first Viscount, then Earl, of Yarmouth. His son William married Lady Charlotte Boyle, an illegitimate daughter of Charles II., but with him the main line and the title became extinct. It was due to the extravagance of the last that the letters were sold to Peter Le Neve, from whom they passed into the hands of 'honest' Tom Martin of Palgrave, and eventually of Sir John Fenn, who edited a selection in two quartos in 1787. The editor presented the originals of these to the king, and was knighted, but these originals have since strangely disappeared. Volumes iii. and iv. followed in 1789; vol. v. posthumously, edited by Mr Serjeant Frere, in 1823. The originals of vol. v. were dis-

covered at Mr Serjeant Frere's house at Dungate, Cambridgeshire, in 1865; those of iii. and iv. were long missing, but the whole 220 were discovered in 1875 at the family mansion of the Freres at Roydon Hall near Diss, together with ninety-five unpublished letters of the same period, described in Mr Gairdner's third appendix. These 311 letters were offered for sale in a London auction-room in 1888, but failed to find a purchaser at 500 guineas.

There is an admirable edition of the Paston Letters by James Gairdner in Arber's 'Annotated Reprints' (3 vols. 1872-4-5). It contains double as many letters as Sir John Fenn's, and, moreover, the letters are here for the first time arranged in chronological order. Mr Gairdner's answer (*Fort. Review*, No. 11) to Herman Merivale's attack on the authenticity of the Paston Letters (*Fort. Review*, No. 8) was completely satisfactory.

Pastor (*Pastor roseus*), a beautiful bird allied to the starlings. It is a native of the plains of Western Asia, winters in India, and strays even to north-west Europe. The greenish-black plumage

Pastor (*Pastor roseus*).

is relieved by pink about the shoulders and some other parts. The bird is a welcome enemy of locusts, and the name probably refers to its habit of following flocks of sheep.

Pastoral Epistles. See BIBLE, Vol. II. p. 124; and the articles TIMOTHY, TITUS.

Pastorales. See BASQUES.

Pastoral Letter, a letter addressed, either at certain stated times or on the occurrence of some notable occasion, by a 'pastor,' but especially by a bishop, to the clergy under his jurisdiction, to the laity of his flock, or to both.

Pastoral Poetry professes to delineate the scenes and incidents of shepherd life. As an attempt to realise an imaginary and highly idealised state of society it is a completely artificial form, and it has already disappeared from literature, never to be revived. The delightful Dorsetshire poems of Barnes exhibit the only natural method in which pastoral society can give subjects to modern poetic art. The pastorals of our modern literatures are essentially a humanistic revival of the Greek *idyl* of Theocritus, Bion, and Moschus, and the Latin *eclogue* of Virgil, and first made their appearance in Tuscany in the 16th century. The earliest dramatic pastoral is the *Favola di Orfeo* of Politian, performed at the court of Mantua in 1472, but the first complete pastoral was Agostino Beccari's comedy, *Il Sacrificio*, played at Ferrara in 1554. Its finest and most famous successors were the *Aminta* of Tasso, represented at the court of Ferrara in 1573, and Guarini's *Pastor Fido*. The earliest non-dramatic pastoral was G. Sannazaro's *Arcadia* (1504), which through Sidney's famous romance with the same title exercised a great influence upon English literature. In Spain the pastoral flourished during the

16th century, some of the most notable names being Gil Vicente, Jorge de Montemayor (*Diana*, 1524), and Cervantes (*Galatea*, a pastoral romance, 1584). In France we already find Rémy Belleau's miscellany, *La Bergerie* (1565), and the writing of pastorals was practised long after even by the great Richelieu. After Honoré d'Urfé's *Astrée* (1610), came a long succession of lengthy pastoral romances by Mdlle. de Scudéry, La Calprenède, and Gomberville. In England we had already had Alexander Barclay's translations of Baptist Mantuan, and Barnaby Googe's *Eglogs*, *Epytaphes*, and *Sonnettes* (1563), before the twelve charming eclogues composing Spenser's *Shepherd's Calendar* (1579) formed once for all a faultless model for posterity. The poem is appropriately dedicated to Sir Philip Sidney, whose pastoral romance of *Arcadia* outstrips in point of literary beauty all other fictions of that class. Its successors were Robert Greene's *Morando* (1584) and *Menaphon* (1589), Lyly's *Gallathea* (1584), Peele's *Arraignment of Paris* (1584), and, most famous of all, Lodge's *Rosalynde* (1590). Spenser's poetical idealisation of pastoral life, again, gave rich inspiration to Drayton, Daniel, Barnfield, Marlowe, Nicholas Breton, Wither, William Browne, Herrick, Ben Jonson (*Sad Shepherd*), and Fletcher (*Faithful Shepherdess*, 1610, the finest of all pastoral plays). An 18th-century revival gave us the pastorals of Ambrose Philips and of Pope, and awakened a pretty quarrel between the two ill-matched champions; Gay's *Shepherd's Week* was much better poetry than either, and was brightened by honest humour and glimpses of genuine country life. An imitator, Allan Ramsay, also achieved a success in his *Gentle Shepherd*, which is almost as good as Gay, though far behind Spenser.

Pastoral Staff, often also, although not properly, called Crosier (q.v.), one of the insignia of the episcopal office, sometimes also borne by an abbot. It is a tall staff of metal, or of wood ornamented with metal, having, at least in the Western Church, the head curved in the form of a shepherd's crook, as a symbol of the pastoral office. From an early time the pastoral staff was connected with the actual possession of the jurisdiction which it symbolises. The giving of it was one of the ceremonies of investiture; its withdrawal was part of the form of deprivation; its voluntary abandonment accompanied the act of resignation; its being broken was the most solemn form of degradation. We annex as a specimen of the highest art the pastoral staff of William of Wykeham, now preserved in his foundation, New College, Oxford. A very early form of the pastoral staff is represented at FILLAN (ST).

Pastoral Staff.

Pastoral Theology, that branch of theological science which regards the duties and obligations of pastors in relation to the care of souls.

Pasture. A pasture may be defined as a crop of mixed grasses and clovers, or other leguminous plants, intended for purposes of grazing. Such a crop usually occupies the land for many years, and is then called permanent pasture. The chief benefit accruing to the farmer is that the mixed plants occupy the land more completely than the same constituents grown in separate plots. The various

species of the mixture overlap and foster one another; thus produce is increased, and quality of herbage improved. From this point of view, a pasture is an agricultural device for increasing the amount of land at disposal, since from a single acre of mixed crop as much produce may be obtained as from, say, $1\frac{1}{2}$ acre laid down under pure sowings.

The chief plants used in Britain for forming pasture may be classified thus:

(A) *Top Grasses*.—Cock's-foot (*Dactylis glomerata*), Meadow Fescue (*Festuca pratensis*), Meadow Fox-tail (*Alopecurus pratensis*), Timothy (*Phleum pratense*), Italian Ryegrass (*Lolium italicum*).

(B) *Bottom Grasses*.—Crested Dog's-tail (*Cynosurus cristatus*), Fiorin (*Agrostis stolonifera*), Hard Fescue (*Festuca duriuscula*), Rough-stalked Meadow Grass (*Poa trivialis*), Smooth-stalked Meadow Grass (*Poa pratensis*), Wood Meadow Grass (*Poa nemoralis*), Sweet Vernal (*Anthoxanthum odoratum*), Yellow Oat-grass (*Avena flavescens*), Perennial Ryegrass (*Lolium perenne*).

(C) *Clovers and Leguminous Plants*.—Alsike Clover (*Trifolium hybridum*), Red Clover (*Trifolium pratense*), White Clover (*Trifolium repens*), Trefoil (*Medicago lupulina*), Bird's-foot Trefoil (*Lotus corniculatus*).

This list includes several species which are not permanent, but of short duration, as Timothy, Italian and perennial, ryegrass, red and Alsike clover, and trefoil. Timothy lasts from four to six years, and at times even longer. Perennial ryegrass has a very misleading name, inasmuch as it may die out in three or four years; in other cases, where seeding is prevented, the ryegrass may become, to all intents and purposes, a perennial plant. The reasons for including short-lived constituents in permanent pasture are obvious. They not only give increased produce during the first years of the lea, when the permanent species are slow in coming forward, but hold possession of land which would otherwise be bare, and thus keep out worthless plants. Place is made for the expanding perennials by the short-lived species which gradually die out. This must be carefully borne in mind when fixing the proportion of short-lived plants in a mixture.

The following are the leading principles according to which the various constituents of a mixture are proportioned: (1) To obtain maximum produce, the land must be filled with roots as thoroughly and completely as possible. This is accomplished by incorporating deep-rooted and shallow-rooted plants in due proportions. If, for example, a soil is 3 feet deep, and the roots occupy merely 1 foot of this depth, two-thirds of the land is, evidently, lying idle and unutilised, not for one year, as when under an ordinary crop, but for a long series of years in the case of a permanent pasture.

(2) The nutritive value of the mixed herbage depends upon the relative proportion of grass and clover: the albuminoid ratio increases with the amount of clover. For a permanent pasture good proportions are clovers, 20 to 30 per cent. of total area; grasses, 70 to 80 per cent.

(3) As many species as possible should be represented in the mixture. If one is injuriously affected by drought, another, which revels in drought, is ready to take its place; if one is late, another is early; if one is not relished by the browsing animal, another is, and so on.

(4) Those species which are best and most suitable for the soil should be most largely represented.

(5) Certain species liable to overrun the pasture, or to destroy other good plants, ought to be represented in extremely small proportions. This applies more particularly to ryegrasses (especially

Italian), crested dog's-tail, and smooth-stalked meadow grass.

(6) The short-lived components should not cover more than one-third of the whole land.

According to these principles, a mixture suitable for a wet clay might be proportioned as follows :

Area of the land to be covered by clovers, 20 per cent :

Red clover.....5 per cent.	White clover.....5 per cent.
Alsike clover.....5 "	Bird's-foot trefoil...5 "

Area to be covered by short-lived grasses, 20 per cent :

Timothy.....15 per cent. | Perennial ryegrass....5 percent.

Area to be covered by permanent grasses, 60 per cent :

Cock's-foot.....20 per cent.	Rough-stalked meadow
Meadow fescue.....15 "	grass.....10 per cent.
Meadow fox-tail....10 "	Smooth-stalked do. 5 "

The percentage area of land to be occupied by each component being determined and known, the percentage numbers have to be translated into pounds of seed per acre. To get the number of pounds corresponding to these areas the covering power of each kind of seed used must be known. We assume, as a basis for calculation, that the seed is perfect in quality—i.e. the percentage of purity is 100, and the percentage of germination also 100. According to Stibler, one acre of land is covered by the following amounts of perfectly pure and germinating seeds :

	Lbs. of Seed per acre.		Lbs. of Seed per acre.
Cock's-foot.....	28	Hard fescue.....	19
Meadow fescue.....	56	Sweet vernal.....	12
Meadow fox-tail.....	10	Yellow oat-grass.....	7
Timothy.....	21	Perennial ryegrass.....	58
Italian ryegrass.....	49	Alsike clover.....	14
Crested dog's-tail.....	20	Red ".....	24
Florin.....	11	White ".....	12
Rough-stalked meadow grass.....	13	Trefoil.....	23
Smooth-stalked ".....	18	Bird's-foot trefoil.....	7

In using these numbers as a basis for calculating mixtures, allowance must be made for seeds which cannot germinate on account of imperfect tillage, and also for the overlapping of the plants when grown in mixture. An allowance of 50 per cent. is found, in ordinary cases, to meet these requirements. The amount of seed per acre actually used in mixtures is, accordingly, the amount calculated for an acre and a half.

The mixture already given for a wet clay soil when translated into pounds of perfect seed per acre (making an allowance of 50 per cent.) is :

Red clover.....1.8	Cock's-foot.....8.4
Alsike clover.....1.0	Meadow fescue.....12.6
White "......9	Meadow fox-tail.....1.5
Bird's-foot trefoil......5	Rough-stalked meadow
Timothy.....4.6	grass.....1.9
Perennial ryegrass.....4.3	Smooth-stalked ditto......9

By simple proportion pounds of perfect seed can be immediately converted into pounds of commercial seed of any given quality.

Patagonia, the most southern region of the South American continent, extending from S. lat. 39° southwards to the Strait of Magellan, which, for a distance of 375 miles, separates it from the desolate archipelago of Tierra del Fuego. Length, upwards of 1000 miles ; greatest breadth, about 480 miles ; area, about 322,550 sq. m. ; population, doubtfully estimated at about 20,000. Like the rest of the continent, Patagonia is divided by the Andes into two very unequal and dissimilar territories. Since 1881 nearly the whole country east of the watershed has been formally recognised as part of the Argentine Republic ; while Chili, which previously claimed a considerable share of that area, has contented herself with the country to the west and a strip along the southern coast. Thus the political in the main agrees with the physical partition.

Western or Chilian Patagonia (63,000 sq. m.), comprising the territory of Magellan, is rugged and mountainous. Along the coast, and stretch-

ing from 42° S. to the Strait of Magellan, are numerous islands, with precipitous shores, belonging apparently to the system of the Cordilleras ; the principal being the Chonos Archipelago (q.v.), Wellington Island, the Archipelago of Madre de Dios, Queen Adelaide's Archipelago, and Desolation Island. These islands, together with several peninsulas, notably Taytao, form a coast almost as rugged as that of Norway ; but in none of them do the mountains rise to the snow-line. Even in the Cordilleras proper the summits are less lofty towards the south ; but the following are worthy of note—the volcanoes of Minchinmavida and Corcovado (respectively 8000 and 7510 feet high), Monte San Valentin (12,697), Chalten or Fitzroy volcano (7120), and Mount Stokes. From the Andes to the Pacific the strip of shore is so narrow that the longest river of this district has its origin only about 13 miles from the coast. In the Island of Chiloe (q.v.), to the north of Western Patagonia, the mean temperature of winter is about 40°, that of summer rather above 50° ; while at Port Famine, 800 miles nearer antarctic latitudes, the mean temperature is in winter about 33°, and in summer about 50°. This unusually small difference in the mean temperature of the extremes of Western Patagonia is due to the great dampness of the atmosphere all along the coast. The prevailing winds blow from the west ; heavily charged with moisture from the Pacific Ocean, they strike against the Andes, and cause almost perpetual precipitation from Chiloe to the Strait of Magellan. South of 47° S. lat. hardly a day passes without rain, snow, or sleet. This continual dampness has produced forests of almost tropical luxuriance, which yield valuable timber. Coal is mined in the neighbourhood of Punta Arenas (Sandy Point) ; and here the Chilian government has, since 1851, a colony and penal settlement (pop. in 1882, 1291).

Eastern or Argentine Patagonia consists mainly of high undulating plains or plateaus rising in successive terraces, and frequently intersected by valleys and ravines. These plateaus are occasionally covered with coarse grass, but more frequently with a sparse vegetation of stunted bushes and herbs ; elsewhere the surface is strewn with huge boulders, and again rugged with heaps or ridges of bare, sharp-edged rocks. Keen and often piercing blasts sweep chiefly from the west ; and as this wind has already parted with its moisture on the other side of the mountains, hardly any rain falls in Argentine Patagonia during seven or eight months of the year. The soil in many places is strongly impregnated with saltpetre, and salt-lakes and lagoons are numerous. North of the Rio Chico, and towards the seacoast, there is a wild, weird, desolate region called by the Indians 'The Devil's Country.' Several wastes of this kind fringe the Atlantic, and formerly induced the belief that Patagonia was a barren and waterless desert ; but the interior, though not fertile, really abounds in lagoons, springs, and streams, and the banks of the rivers are capable of cultivation. Along the eastern base of the Andes, also, there is a great tract of territory which is astonishingly picturesque and fertile, with great forests to which the Indians retire for shelter from the freezing winds of winter. The principal rivers of Argentine Patagonia are the Rio Negro (q.v.), which forms its northern boundary, the Chubut (q.v.), Deseado, Chico, Santa Cruz, and Gallegos. All these rivers rise in the Andes. To the west of San Martin and Moreno appears the smoking summit of Chalten ; and the whole scenery of the district, with rugged mountains rising sheer from the water, with glaciers, snows, and floating icebergs, is unspeakably grand and terrible. The

whole of Eastern Patagonia has probably been raised above the sea-level in the Tertiary period, and its most characteristic geological feature is its boundless expanses of shingle. The flora is in consequence exceptionally poor, and appears to be mainly derived from the lower slopes of the Andes. Herds of horses and, in the more favoured regions, cattle are bred; pumas and foxes, armadillos, skunks, and tucutucos (a peculiar rodent) are met with; and among the birds are condors, hawks, partridges, and flamingoes, ducks, and other water-fowl. But by far the most important animals are the guanaco or Huanaca (q.v.), sometimes in herds of two hundred or more, and two species of Rhea (q.v.).

Inhabitants.—The population of Western Patagonia, estimated at 3200 (or, including Tierra del Fuego, 4000), consists of a number of small indigenous nomadic tribes of Araucanian stock who live by fishing and hunting, and the settlers at Punta Arenas or Magellan's colony, mainly immigrants from Chiloe and other parts of Chili. In Eastern Patagonia the Argentine herdsmen are beginning to pasture their cattle in the northern valleys, and Chilian immigrants are moving eastwards. The Patagonians proper or Tehuelche Indians, who are confined to Eastern Patagonia, are perhaps about 7000 strong. They are generally divided into two great tribes, the northern and the southern, which speak the same language, but are distinguishable by difference of accent. The northern range chiefly over the district between the Cordilleras and the Atlantic, from the Rio Negro to the Chubut, and even the Santa Cruz River. The southern, who appear to be on an average taller and finer, and are more expert hunters, occupy the rest of Patagonia as far south as the Strait of Magellan. The two divisions are much intermixed. Magellan described the Patagonians as 'so tall that the tallest of us came up only to their waists;' and, though such extravagant statements have led others to deny the claim of the Patagonians to be considered exceptional, there is no doubt that they are one of the tallest races on the globe. The average height of the male members of Musters' party was rather over 5 feet 10 inches; two others, measured at Santa Cruz, stood 6 feet 4 inches each; Pikechoche, who was in Berlin in 1879, was 5 feet 9 inches high, and stretched 5 feet 11 inches with his arms. The muscular development of the arms and chest is extraordinary, and in general the body is well proportioned. The Patagonians are splendid swimmers, can walk great distances and for two and even three days on end without being tired. Their cranial characteristics are somewhat disguised by the fact that the hinder part of the skull is artificially flattened, the custom being to strap the child's head back to a board to prevent it 'wagging' when carried about the country on horseback. This process, however, appears only to exaggerate a natural tendency; and it is asserted by the most scientific investigators that the Patagonian skull is, next to that of the Lapps, the shortest in the world. The jaws are powerful, though with no trace of prognathism. The expression of their face is ordinarily good-humoured though serious; their eyes are dark brown, bright and intelligent, their noses aquiline and well-formed, their foreheads open and prominent. The complexion of the men, when cleansed from paint, is a reddish or rather yellowish brown. Thick flowing masses of long coarse, black, glossy hair cover their heads. The scanty natural growth of beard, moustaches, and even eyebrows, is carefully eradicated. The young women are frequently good-looking, displaying healthy, ruddy cheeks when not disguised with paint. The dress of the men consists of an under-garment round the

loins, a long mantle of hide with the fur inside, and boots or buskins of skin. The dress of the women is very similar. Both sexes are fond of ornaments. Besides mantles of guanaco hide, their only manufactures are saddles, bridles, stirrups, and lassos, which often evince wonderful ingenuity and nicety of execution.

The Patagonians believe in a great and good spirit who created the Indians and animals. Idols are unknown, and whatever religious acts the natives perform are prompted by dread of demons. Kindly, good-tempered, impulsive children of nature, the Tehuelche take great likes or dislikes, becoming firm friends or equally confirmed enemies. Protestant missions have been established amongst them. They are steadily decreasing through disease and bad liquor supplied by traders, and before long will be extinct. The language is quite different from either Pampa or Araucanian. Of European settlements there are few in Argentine Patagonia. The oldest, Patagones (formerly El Carmen), on the Rio Negro, about 18 miles from its mouth, has a population of about 2000, composed of Spanish and other settlers (negroes), and convicts from Buenos Ayres. There are also the Welsh colony on the Chubut (q.v.), and a petty station at the mouth of the Santa Cruz.

History.—Magellan, before passing through the strait, had in 1520 sailed along the whole of the Patagonian coast; and it is commonly believed that it was from the large footsteps (*patagones*) observed near his winter-quarters at S. Julian that the country derived its name. Another suggested etymology is the Quichua word *patacuna*, 'terraces,' the rule of the Incas having extended hither. The great plain was traversed by Rodrigo de Isla in 1535. Sarmiento de Gambo (commemorated by the mountain in Tierra del Fuego) added greatly to the knowledge of the west and south (1579-80), and founded Spanish settlements, doomed to early extinction, at Nombre de Dios and San Felipe (Port Famine). English interest in the country, aroused by Drake's voyage in 1577, was kept up by Davis, Narborough, Byron, Wallis, and the Jesuit Falkner, and at last the beginning of a real scientific acquaintance with the interior was made by King, Fitzroy, Darwin, and Musters. Since 1870 careful explorations have been carried out by Argentine travellers.

English works on Patagonia are Falkner's (1774), Snow's (1857), Musters' (1871), Beerbohm's (1878), Lady Florence Dixie's (1880), Coan's (1880), Lucy Fossarieu's (French, 1884).

Patan, a walled town of India, in the territory of the Guicowar of Gujarat, 64 miles NW. from Ahmadabad, stands on a tributary of the Banas. It manufactures swords, spears, pottery, and silk and cotton goods. Standing on the site of the ancient Anhilwara, and the capital of native dynasties from the 8th century to the present day, Patan is surrounded with lofty walls, and has numerous architectural ruins. Pop. (1881) 32,712.

Patanjali is the name of two celebrated authors of ancient India, who are sometimes looked upon as the same personage, but apparently for no other reason than that they bear the same name. The one is the author of the system of philosophy called Yoga (see SANSKRIT LITERATURE), the other the critic of Pānini (q.v.), circa 140 B.C.

Patches. During the whole of the 17th and beginning of the 18th century these fantastic ornaments were commonly worn by women and sometimes by men. In *Jack Drum's Entertainment, or the Comedie of Pasquil and Katherine* (1601; 2d ed. 1616), they are thus mentioned: 'For even as blacke patches are worne, some for pride, some

to stay the Rheume, and some to hide the scab,' &c.; and in the *Artificial Changeling* (1650) there is a woodcut showing the lady of fashion, with a coach, coachman, two horses, and postillions gummed on to her forehead, and the rest of her face ornamented with a star, two crescents, and a large round spot. In the same year (1650) a Bill against 'painting, black patches, and immodest dresses' was read for the first time, but got no further. In vain were sermons preached; in vain did *Morbus Satanicus*, or *The Sin of Pride*, in 1666 reach the 15th edition; in vain did satirists assail the *Metamorphosis of Fair Faces into Foul Visages* (temp. James I.); the senseless custom was still rife when (1712) Pope described among the treasures of Belinda's toilet-table 'Puffs, Powders, Patches, Bibles, Billet-doux' (*Rape of the Lock*, l. 138). Attempts have been made to revive the fashion, but without success. See Fairholt's *History of Dress and Costume in England* (2d ed. 1860).

Patchouli, a perfume derived from the dried branches of *Pogostemon patchouli* (natural order Labiatae), first introduced into Britain as an article of merchandise in 1844. The name is from the Tamil *patchei*, 'gum,' and *elei*, 'leaf.' The plant, a low shrub 2½ or 3 feet high, is a native of Silhet, the Malay coast, Ceylon, Java, the neighbourhood of Bombay, and probably also of China; but, owing to the fondness of Asiatics for the perfume which it yields, it is difficult to say where it is native or cultivated. Every part of the plant is odoriferous, but the younger portions of the branches with the leaves are chosen; they are usually about a foot long. The odour is peculiar and difficult to define, but it has a slight resemblance to sandalwood; it is very powerful, and to many persons is extremely disagreeable. The odour of patchouli was known in Europe before the material itself was introduced, in consequence of its use in Cashmere to scent the shawls with a view of keeping out moths, which are averse to it; hence the genuine Cashmere shawls were known by their scent, until the French found the secret, and imported the herb for use in the same way. In India it is used as an ingredient in fancy tobaccos and as a perfume for the hair. It is also much prized for keeping insects from linen and woollen articles. The essence of patchouli is a peculiar heavy brown oil, with a disagreeably powerful odour; it is obtained by distillation, and requires extreme dilution for perfumery purposes. A cwt. of the plant yields about 28 oz. of the oil. The Arabs believe it to be efficacious in preventing contagion and prolonging life.

Patella. See KNEE, and LIMPET.

Paten (Lat. *patina*, 'a dish'), a small circular plate employed for the wafers or bread in the eucharistic service. It is always of the same material as the chalice, often richly chased or carved, and studded with precious stones.

Patent Medicines. In popular language this term is very loosely applied; being used to include not only patent medicines strictly so called, but also all proprietary medicines and all medicines liable to stamp-duty. The exact meaning of the technical phrase 'patent medicine' has never been defined by a legal judgment, but it is almost certain that it would only be held to include such medicines as are sold under the authority of letters-patent (i.e. for which a patent has been taken out), and that it does not include other dutiable medicines. The number of medicines for the making of which patents have been taken out in Britain is comparatively small, amounting only to about 220 articles between the years 1711 and 1887, and most of these are no longer in use. Patented medicines, therefore, constitute only a very small proportion

of those medicinal preparations which are liable to stamp-duty. Medicines which are so liable embrace a very wide category. A preparation to be liable to stamp-duty must be one which is to be 'used or applied externally or internally as a medicine or medicament for the prevention, cure, or relief of a disorder or complaint incident to or in any wise affecting the human body.' Then it must also be brought under one of the following six causes, which constitute liability to duty: (1) the seller must have or claim to have an occult secret or art for making or preparing, or (2) an exclusive right or title to making or preparing; or (3) it must have been patented; or (4) it must be, or have been, recommended to the public as a nostrum (Lat. *noster*, 'our') or proprietary medicine, or (5) as a specific, or (6) as beneficial for the prevention, cure, or relief of any disease. Any one of these entails liability to stamp-duty independently of the others.

All other medicines are exempt from stamp-duty; that is to say, drugs the 'denominations, properties, qualities, virtues, and efficacies' of which are known and admitted in medicine, and in the making or preparing of which no secret art or exclusive right is claimed by any person. Instruments, electric and galvanic apparatus, liver-pads, and similar appliances, cigarettes, preparations intended to be burned and inhaled or used as disinfectants, natural products, mineral waters, lozenges and confectionery, articles of toilet and perfumery, are all as a rule exempt from stamp-duty unless under special circumstances. The first tax on proprietary and secret medicines in Great Britain was imposed in 1783, when all persons who sold medicines and who had not been bred as doctors or apothecaries were required to take out a license on which they paid stamp-duty, and in addition *ad valorem* stamp-duties were imposed on the medicines. It was estimated by the then Chancellor of the Exchequer that the new tax would yield £15,000 per annum. This act was amended two years later, and has been so altered by thirteen subsequent acts that none of its original provisions now remain. The patent-medicine stamp is a narrow label convenient for pasting on to a bottle or box. Such stamps are supplied by the commissioners of stamps, but for an extra payment any person may have the privilege of having stamps printed in the stamping department of Somerset House for his own exclusive use and on his own forms. The stamp affords no government guarantee of purity; its presence on any bottle or package simply signifies that the duty has been paid. The medicine must be stamped before it is sold either wholesale or retail, or for foreign or home consumption. Medicines are not considered liable to duty as long as they remain in bulk, nor are samples distributed gratis liable. The rates of duty vary from 1½d. on a package not exceeding 1s. in value to £1 on a package upwards of 50s. in value. The vendors of dutiable medicines are required to take out a yearly license, for which they pay 5s. Penalties are enforced for any infringement of the regulations. In 1860 the medicine-stamp duty yielded a revenue of £43,692; in 1870, £72,353; in 1880, £135,366; the year ending March 31, 1890, it was £217,264. See Alpe, *Handy Book of Medicine Stamp Duty*.

Patents. In the widest sense of the term, a patent is a royal grant made by letters-patent (*litterae patentes*) or open letters, 'so called because they are not sealed up, but exposed to open view, with the Great Seal' (or a lawful substitute for the Great Seal) 'pendent at the bottom; and are usually addressed by the sovereign to all the subjects of the realm' (Blackstone). The principal grants made by letters-patent are titles of honour, such as

peerages and baronetcies, appointments to judicial and administrative offices, charters of incorporation, and monopolies of the right to make, use, exercise, and vend new inventions. Of these grants it is here proposed to consider the last mentioned alone, to which the term patent is in common parlance restricted. It may, however, be observed in passing that the procedure connected with royal grants other than patents for inventions is still intricate and technical, resembling that which was in use for patents of invention before the Patent Law Amendment Act of 1852, and that such grants are enrolled on the Patent Rolls, and may be seen at the Record Office or, in the case of recent grants, at the Chancery Enrolment Office, London.

From a very early period in our history the sovereign has enjoyed and exercised the prerogative of securing to inventors, for a limited term, 'the sole right of making, using, and vending' new and useful inventions. Thus, it is stated that Edward III., on the representation of some alchemists, granted a commission to two friars and two aldermen to inquire whether a philosopher's stone might be made, and, on their reporting that the project was feasible, granted to the two aldermen a patent of privilege that they and their assignees should have the sole making of the philosopher's stone. Upon the royal prerogative, however, of which this case offers an early, though in all probability by no means the earliest, illustration, the common law placed certain definite and well-understood restrictions. (1) The sovereign could not grant the sole right to sell articles in common use. Thus, letters-patent granting to one John Peechey the sole importation of sweet wines into London were, at a parliament held in the fiftieth year of the reign of Edward III., declared to be void. (2) A grant of the sole right to exercise a known occupation was bad. This was decided as to the manufacture and importation of playing-cards in the leading case of *Darcy v. Allin*. (3) The grantee was required to have been at least the *introducer* of the invention within the realm. (4) The term of the grant must be for some limited period, such as might be sufficient for the instruction of others. (5) The subject-matter must be such as, in the result, led to a new trade or manufacture. (6) The patented invention must possess the incidents of utility and novelty, and must not be prejudicial or inconvenient to trade (1 Webster Patent Cases, 7. n.).

In the reign of Elizabeth, however, and still more emphatically in the reign of James I., the old common-law monopoly changed its character. The number of *bona-fide* inventions or discoveries was small. But the financial and political difficulties of the sovereign were great. The royal prerogative of granting limited monopolies 'for the good of the realm and the furtherance of trade' came, with many other doubtful expedients, to the sovereign's assistance. The common-law limitations were ignored. Currants, salt, iron, powder, cards, calfskin, paper, tin, sulphur, and a hundred other commodities in common use were appropriated to monopolists for practically unlimited periods. The patentees were enabled to charge extortionate prices for inferior articles, to enter (at least under the saltpetre patents) private houses and ransack stables and cellars for infringing articles, and to have infringers brought before the council and punished for contempt of the royal authority. After a protracted struggle, in the course of which Queen Elizabeth recalled most of her obnoxious grants, and James published a counterblast against monopolies, which influenced his subsequent conduct very slightly, the famous Statute of Monopolies was passed in 1624. The purview of the measure has often been misrepresented. It did not, as we have seen, *create* the royal prerogative to

grant letters-patent for inventions. But it declared that all such monopolies as the sovereign had latterly been granting were contrary to law and void. It then excepted from this sweeping prohibition (*inter alia*) 'grants of privilege for the term of fourteen years or under, thereafter to be made, of the sole working or making of any manner of new manufactures within the realm, to the true or first inventor or inventors, which others, at the time of making such letters-patent and grants, shall not use, so as also they be not contrary to the law, nor mischievous to the state, by raising prices of commodities at home, or to the hurt of trade, or generally inconvenient.'

This saving clause in the Statute of Monopolies is the foundation of the modern English patent system. It preserves, and at the same time limits, the royal prerogative to grant monopolies of inventions, and it gives a most succinct, and yet a complete, statement of the characteristics of a valid patent-grant. The *term* of the grant is to be fourteen years or under; and patents are in fact now always granted for a term of fourteen years. The *grantee* is to be 'the true and first inventor'—words which a series of judicial decisions has interpreted as including the first importer from abroad—of the patented invention. The *privilege* conferred is the sole and exclusive right to work or make the invention; and the *subject-matter* of a valid grant is 'any manner of new manufacture within the realm' which is (a) not in use at the date of the grant, (b) not contrary to law or mischievous to the state, (c) not to the hurt of trade, or (d) not generally inconvenient. The next important measure in the history of our patent law is Lord Brougham's Act, 1835. At common law, letters-patent were wholly void for any defect in part, not being a mere clerical error which the Master of the Rolls could correct; and a patentee was liable to be deprived of his patent from the failure of some condition, such as want of novelty in a very trifling part of the invention. The Act of 1835 enabled a patentee to enter with the clerk of patents, by permission of the crown, signified by the *fiat* of the law officer, a *disclaimer* of any part of the title or a memorandum of any alteration therein, which upon being filed by the clerk of patents, and enrolled with the description of the patent, was deemed and taken to be part of the letters-patent in all courts whatever. A still more important change was introduced by the Patent Law Amendment Act, 1852. The policy of granting patents is not only to reward inventors, but to induce them to disclose their inventions to the public. Different means of attaining the latter object have been adopted at different stages in the history of our patent law. The earliest practice was to insert in the grant a proviso requiring the inventor and his assignee to take apprentices during the last seven years of the term, and to teach them 'the knowledge and mystery' of his invention. In the reign of Queen Anne the patentee was required within a certain period (usually six months) after obtaining his patent to enrol at one of the public record offices a *specification* or description of his invention, upon the accuracy and sufficiency of which the validity of his grant in great measure depended. This practice had several grave disadvantages. There were three offices in which specifications might be enrolled—the Enrolment Office, the Rolls Chapel, and the Petty Bag Office; in each of these offices a laborious search might have to be made before a particular specification could be discovered and inspected. Again, the interval of time which elapsed between the grant of a patent and the enrolment of the specification enabled a patentee first to obtain protection for what might be merely

a crude idea, and then to work out its details, altering and modifying them at will, during the protected interval. The Patent Law Amendment Act of 1852, adopting a practice which was in force in several continental countries, and which was strongly recommended by most of the witnesses who gave evidence before the committees of 1829 and 1851, provided that a petition for the grant of letters-patent should be accompanied by a statement in writing, describing the nature of the invention which it was sought to patent; this statement was called the *provisional specification*. The effect of the procedure prescribed by the act was that a patentee might use his invention for six months without prejudice to his patent by that user, but he obtained no rights against the public until his patent had been sealed. The patentee was merely protected against the consequences of his own publication, and enabled to employ workmen and obtain machinery without the risk of being betrayed.

The existing law of patents depends upon the Statute of Monopolies, the Patents Acts, 1833-88, and the Patents Rules, 1890, made by the Board of Trade under statutory authority. The present procedure to obtain a patent is as follows: An application signed by the inventor himself, and accompanied by a 'provisional specification,' in which the nature of his invention is briefly and generally described, is lodged at the Patent Office. The application and specification are then referred by the comptroller-general, who is the official head of the department, to an examiner who ascertains and reports to him whether (1) the nature of the invention has been fairly described, (2) the application, specification, and drawings, if any, have been prepared in the prescribed manner, (3) the title selected by the applicant sufficiently indicates the subject-matter of the invention, and (4) the specification does not describe more than one invention. No preliminary examination as to the novelty of the invention is held. The comptroller may, however, refuse to grant a patent for any invention of which the use would, in his opinion, be contrary to law or morality, and from such refusal no appeal can be taken. If the examiner report against the applicant on any of the grounds mentioned above, the comptroller may require the application, specification, or drawings to be amended before he proceeds with the application. Against this decision the applicant may appeal to the law officer, whose judgment is final. If, however, the examiner report in the affirmative upon each of the issues submitted to him, the application is accepted. Within nine months—a period which the comptroller may on payment of the prescribed fee extend to ten months—from the date of his application the applicant must deposit at the Patent Office a *complete specification*, particularly describing the nature of the invention and the best method of carrying it out. If the examiner report that the complete specification (1) does not fairly describe the invention, (2) does not terminate with a distinct claim or claims, (3) claims more than one invention, or (4) varies materially from the provisional, the comptroller may refuse to accept it unless and until it has been amended to his satisfaction. From such a refusal the applicant may appeal as before to the law officer, whose decision is final. When the complete specification has been accepted it is printed and published, and the details of the applicant's invention are then for the first time thrown open to public inspection. The comptroller-general causes the fact of the acceptance to be advertised in the official journal of the Patent Office, and the patent is not granted until after the expiration of two months from the date of such advertisement. At any time within that

period any person may oppose the grant on any one or more of the following grounds: (1) that the applicant had obtained the invention from the opponent or from some person of whom the opponent is the legal representative; (2) that the invention had been patented in this country on an application of prior date; (3) that the complete specification describes or claims an invention other than that described in the provisional, and that such other invention forms the subject of an application made by the opponent in the interval between the leaving of the provisional and the leaving of the complete specification. No other ground of opposition is recognised. The opposition is heard and determined by the comptroller-general, whose decision may be appealed against to the law officer. In the event of there being no opposition, or of the opposition proving unsuccessful, the patent is issued under the seal of the Patent Office and bears the date of the original application. The term of the patent is fourteen years from its date. The grant extends to the United Kingdom and the Isle of Man, but not to the Channel Islands or to any of the British possessions or colonies. Under the Act of 1883 a patent lapses at the end of four years unless a certificate of renewal has been obtained on payment of the prescribed fee. The taxes payable for keeping up a patent amount to £150. The specification or drawings relating to a patent may be amended by leave of the comptroller-general after advertising and hearing any opposition to the proposed amendment. No amendment will, however, be sanctioned the effect of which is materially to enlarge the scope of the invention originally claimed. The comptroller-general and probably the Master of the Rolls have power to correct merely clerical errors. If a patentee both fails to work his invention himself and refuses to permit other persons to do so, the Board of Trade may compel him to grant licenses upon reasonable terms.

The infringement of a patent may be restrained by injunction, and punished by damages awarded in an action at law. A patent will be *revoked*—or, as it is termed in Scotland, *reduced*—if it is proved to the satisfaction of the proper court to have been obtained by fraud or false suggestion on the part of the patentee, or to lack the essential requisites of novelty and utility.

A patentee is not compelled to mark articles made according to his invention as 'patented.' But any person who represents that an article sold by him is patented, when in fact no patent has been granted for the same, is liable on summary conviction to a fine not exceeding £5.

Prior to 1835 the term of a patent could only be extended by a special act of parliament (cf. Edmunds' *Patents for Inventions*, pp. 373-376). But the frequency of applications for statutory assistance suggested the propriety of framing some general measure for the extension or prolongation of letters-patent, and Lord Brougham's Act was passed with that view. Other enactments, of which the interest is now chiefly historic, followed; and section 25 of the Act of 1883 completed the legislation upon this subject. The judicial committee of the Privy-council has power to extend for a further period of seven, or in exceptional cases of fourteen, years the term of a patent which, although highly meritorious and useful, has not adequately remunerated the patentee, from circumstances beyond his control, during the original term. It is now the practice of the judicial committee to prolong letters-patent by ordering a *new grant* to be made for the extended term.

Patent Agents.—Before the Patent Law Amendment Act, 1852, only about 500 patents were taken out annually in England. The patent business of

the country would not, therefore, support a separate profession; and the parliamentary reports of 1829 and 1851 throw a somewhat painful light on the proceedings of many of those persons who carried on the work of patent agents in connection with other callings. Under the Act of 1852, however, the number of patents annually obtained greatly increased; foreigners and British subjects abroad desired to patent their inventions more frequently than before, and consequently the work of the patent agent became a distinct profession. On the 12th of August 1882 an Institute of Patent Agents was incorporated under the Companies Acts, 1862 to 1880. The Patents Act, 1888 (sect. 1), created a Register of Patent Agents, on which every person who assumes the name of 'patent agent' after July 1, 1889, must be enrolled under a penalty not exceeding £20. *The Register of Patent Agents Rules*, issued by the Board of Trade, came into operation on 12th June 1889, and gave to the Institute of Patent Agents a practically complete control over the whole profession. A communication to a patent agent is not privileged from disclosure in a court of law, even although he be a solicitor.

The Patent Office.—All the formal, and much of the judicial, work connected with the grant of letters-patent for inventions is done at the Patent Office in Southampton Buildings, Chancery Lane, London. At the head of the whole department is an officer called the comptroller-general, who is appointed by, and responsible to, the Board of Trade, and is assisted by a staff of examiners, clerks, &c. In addition to his formal and judicial duties relating to applications, the comptroller attends to the Register of Patents, in which the names of patentees and notifications of all assignments and licenses must be entered, and prepares an annual report as to the work of the Patent Office, which is laid before both Houses of Parliament. The Patent Office contains a valuable free public library, which is ordinarily open from 10 A.M. to 10 P.M., and in which all the publications of the Patent Office—specifications, reports of cases, illustrated official journals, &c.—may be consulted.

Patents in the United States.—Before the Declaration of Independence patents were occasionally issued by the colonial governments; and the constitution of the United States expressly vested in congress powers 'to promote the progress of science and useful arts by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries.' The congress of 1790 passed an act regulating the issue of patents for inventions, requiring the would-be patentee to petition the Secretary of State, the Secretary of War, or the Attorney-general; with the approval of any two of these the description of the patent was certified by the Attorney-general, and the president directed the issuing of the patent. The patent was recorded in the office of the Secretary of State, and delivered to the patentee under the great seal of the United States. Under this law, which remained practically unchanged till 1836, patents were granted with little examination, and the responsibility of deciding whether the patentee had made out his case was left wholly to the courts—a system found to be inconvenient and unsatisfactory for the interests of the public. On occasion of a fire at the Patent Office, when many of the documents were destroyed, congress repealed former acts and established a new system, which remains in force till now. The general principles of the law are the same as in England, but the term for which patents are granted is seventeen years—longer than elsewhere. The Patent Office is attached to the department of the Secretary of the Interior. The commissioner, assistant-com-

missioner, and three examiners-in-chief are appointed by the president, with the consent of the senate. The chief clerk, a staff of a hundred examiners (principal, first assistants, second assistants, third assistants), draughtsmen, copyists, attendants, &c. are nominated by the commissioner of patents and approved by the Secretary of the Interior. The office publishes pamphlets on *The Patent Laws and Laws relating to the Registration of Trade-marks and Labels*, and *The Rules of Practice in the United States Patent Office*, which may be had on application. But inventors are recommended to secure the assistance of 'patent lawyers,' who are a distinct branch of the legal profession. The minimum expense may be stated at \$60; but difficulties and references to various authorities may greatly increase the outlay. The number of patents issued in the United States greatly exceeds that of any other country. In 1837-46 the number was 5019; in 1847-56 it was 12,578; in the decade 1877-86 it was 169,478; in the century ending 10th April 1890 nearly 437,000 grants were made.

The International Convention.—It has long been the desire of inventors and legislators to bring about an assimilation of the patent laws of the world. As early as 1851 a society called the 'Association of Patentees' included in their list of proposed reforms in the patent law 'international arrangements for a mutual recognition of the rights of inventors.' Adopting in substance the views of Sir H. Bessemer, Sir William Armstrong, and Mr C. W. Siemens, the Select Committee of 1872 recommended that 'Her Majesty's government be requested to inquire of foreign and colonial governments how far they are ready to concur in international arrangements' in relation to the proposed international patent law. In accordance with this recommendation Earl Kimberley, then Colonial Secretary, directed the governors of the British colonies to ascertain the state of colonial opinion upon the subject. At the same time our representatives abroad were required by Lord Granville to prepare succinct reports upon the patent laws of the countries to which they were severally accredited, and these reports were published and laid before parliament in 1873 (C-741). The inquiries thus held showed that colonial and foreign official opinion was in the main favourable to the proposed change, and also that, all divergencies notwithstanding, there existed in the patent laws of the world ample materials out of which an international patent system might eventually be created. The International Congress at Vienna in 1873 and the Paris Congress, organised during the Exhibition of 1878, carried the movement forward; and on 20th March 1883 an 'International Convention for the Protection of Industrial Property' was signed at Paris. The plenipotentiaries of the contracting parties exchanged ratifications on 6th June 1884, and the convention came into effective operation a month later. The original signatories were Belgium, Brazil, Spain, France, Guatemala, Italy, Holland, Portugal, Salvador, Servia, and Switzerland. The accession of Great Britain was delayed until special statutory power had been given to the crown to allow the *ante-dating* of patents granted under the convention. The adhesion of Great Britain to the convention took place on 17th March 1884, and was formally accepted on the 2d of April following. The United States, Norway, Turkey, Tunis, New Zealand, and other countries have subsequently joined the International Union. Germany is the most important European state that still holds aloof. The principal changes introduced into our patent system by this important treaty are these: (1) Formerly a patentee could not import into some of the states now comprised in the union

articles manufactured according to his patent in this and other countries without forfeiture of his rights. Free importation of such articles without the penalty of forfeiture is now allowed. (2) An applicant for a patent in any one of the contracting states may obtain protection for the same invention here at any time within seven months from the date of his foreign application. The subsequent application is *ante-dated* to the date of the first application, and is consequently not defeated by prior publication or user in the protected interval. The working of this provision may be best explained by a simple illustration. A, a French inventor, applies for a patent in Paris on 1st June 1890. At any time within seven months from that date he may apply to the English Patent Office to protect the same invention which he is patenting in France, and the *English application, and the patent granted thereunder, are dated back to the 1st of June*. The result is that A may, for almost seven months after his French application, publicly use his invention in England with perfect safety. No one can say that the patent subsequently granted to him is bad for want of novelty, because the patent ultimately bears the date of the 1st of June, and thus protects the period during which he was using the invention in England.

In connection with the International Convention an international office or bureau has been established at Berne in Switzerland. Its expenses are defrayed by the governments of all the contracting states, and it publishes a monthly periodical entitled *La Propriété Industrielle*, and devoted to the interests of the union. The convention provides for conferences being held successively in one of the contracting states by delegates from the said states with a view to perfect the system of the union. The first meeting took place at Rome in April and May 1886. The number of applications at the English Patent Office for protection under the convention amounted to twenty-six in 1887 and to seventy-one in 1888.

In some countries, such as the United States of America, the Patent Office inquires strictly into the novelty and utility of every invention submitted to it for protection. In others, such as France and Turkey, there is no preliminary examination as to novelty or utility. Indeed, in France the patentee, if he refers to his title at all, is obliged to add the words *sans garantie du gouvernement* or their initial letters, S.G.D.G. In most European states a patentee is compelled to 'work' his invention within a certain time prescribed by law or limited in the grant; but this regulation or *exploitation* law, as it is called, is usually enforced in cases of voluntary and unjustifiable inaction alone. In the United States *designs* are patentable, apparently with a view to the encouragement of the decorative arts. In Switzerland processes apparently cannot be patented. Russian patent law imposes restrictions on the patenting of inventions of war.

See Carpmael's *Patent Laws of the World* (1885), with its supplements, published under the auspices of the Institute of Patent Agents; Lewis Edmunds' *Law of Patents* (1890); W. C. Robinson's *Law of Patents* (3 vols. 1890); the Reports of the Parliamentary Committees (1829-87); the Reports of the Commissioners of Patents (1852-84), and by the Comptroller-general since 1884. See also COPYRIGHT, MONOPOLY, TRADE-MARKS.

Pater, WALTER, was born in London, August 4, 1839, and educated at King's School, Canterbury, and at Queen's College, Oxford, taking a classical second-class in 1862. He was elected to an open fellowship at Brasenose; has travelled in Italy, France, and Germany; and, both by his subtle critical insight and the exquisite finish of his style, has earned his rank among the best prose-

writers of his time. With a wise reticence he has husbanded his gift, hence all his work maintains the same high level of excellence. His books are *Studies in the History of the Renaissance* (1873), a series of essays on art and letters, on such men as Leonardo, Botticelli, Joachim du Bellay, and others, written in exquisitely modulated prose, with faint traces of a conscious daintiness, from which he soon shook himself free; *Marius the Epicurean: his Sensations and Ideas* (2 vols. 1885), an imaginary biography of a young man brought up in Roman paganism, who passes through varied spiritual experiences, meets Marcus Aurelius himself, and at last, shortly before his unexpected death, makes acquaintance with the mysterious new eastern religion, yet without being profoundly influenced by it; *Imaginary Portraits* (1887) of Watteau, Denys l'Auxerrois, Sebastian van Storck, and Duke Carl, whose dream was 'to bring Apollo with his lyre to Germany' half a century at least before his time; and *Appreciations* (1889), a volume of admirable criticism on Charles Lamb, Wordsworth, Coleridge, Rossetti, Sir Thomas Browne, Blake, and on Style itself.

Paterculus, MARCUS VELLEIUS, a Roman historian, born probably about 19 B.C. He served under Tiberius as prefect or legate in Germany, Pannonia, and Dalmatia, was quaestor in 7 A.D., and praetor in 15. He was alive in 30, and may have perished the year after as a friend of Sejanus. His *Historia Romana* is a compendium of universal, but more particularly of Roman history, in two books. The work, as we have it, is not complete, the beginning, and a portion following the 8th chapter, being wanting. The work is slovenly and superficial, marred moreover by inflated rhetoric as well as by ignorant errors, and by fulsome flatteries of Cæsar, Augustus, and Tiberius. The *editio princeps* appeared at Basel in 1520. Good editions are those of J. C. Orelli (1835), F. Kritz (1840-48), and C. Halm (1876).

Pateres were small pieces of ordnance, now obsolete, worked on swivels; most commonly used on board ships, where they were mounted on the gunwale, and discharged showers of old nails, &c. into hostile boats.

Paterno, a town of Sicily, 11 miles NW. of Catania, at the southern base of Mount Etna. Pop. 15,230.

Pater-Noster (Lat., 'Our Father'), called also THE LORD'S PRAYER, a short form of prayer suggested or prescribed by our Lord to his disciples (Matt. vi. 9-13; Luke, xi. 2-4) as the model according to which, in contrast with the prayers of the Pharisees, their petitions ought to be framed. The Pater-Noster has been accepted as, by excellence, the form of Christian prayer. It formed part of all the ancient liturgies, usually introduced with a preface, and said between the consecration of the elements and the communion, except the so-called Clementine liturgy, in which it does not appear at all, and the Abyssinian, in which it is said, as in the English, after the communion. St Gregory finally settled its place in the Roman Mass, immediately after the Canon and before the fraction. Whereas in the East it was said by both priest and people, in the Roman use it was recited by the priest alone. The Catechism of the Council of Trent contains a detailed exposition and commentary on it, and in all the services, not only of the Roman Missal, Breviary, Ritual, Processional, and Ordinal, but in all the occasional services prescribed from time to time, it is invariably introduced. In the Mass it is said aloud, but in the Breviary secretly, or with at most the first and concluding words said audibly. In the Rosary of the Virgin Mary it is combined

with the Hail Mary (whence the larger beads of the 'Rosary' are sometimes called *Pater-Nosters*), and perhaps the most usual of the shorter devotions among Roman Catholics is the recitation of the 'Pater,' with one or more 'Ave Marias,' concluding with the Doxology. The Pater-Noster as commonly used by Protestants concludes with the clause, 'for Thine is the kingdom, the power, and the glory for ever [or, for ever and ever]. Amen,' but this is wanting in the most ancient authorities. This embolism or intercalated prayer occurs in all the liturgies, Roman, Mozarabic, Gallican, Greek, Coptic, and Armenian. Of the two gospels—that of Matthew and that of Luke—in which the prayer is contained, that of Luke has not this clause; and even in the gospel of Matthew it is found only in the later MSS., in which it cannot be doubted that it is a modern interpolation. It was retained, however, in Luther's German translation, in the Prayer-book (original) version, and in the English authorised version. In the revised version it is omitted both in Matthew and Luke; in Luke, 'which art in heaven,' the whole of the third petition, and 'deliver us from evil' are relegated to the margin; and in Matthew, 'deliver us from evil' is properly rendered 'deliver us from the evil one.'

Many polyglot collections of the Pater-Noster have been published from the 16th century downwards, the most remarkable of which are those of John Chamberlayne in 150 languages (1715), of Conrad Gesner in 200 (1748), and that of Padre Hervas in 307 (1787). There are expositions of the Lord's Prayer by Origen, Chrysostom, Gregory Nyssa, Cyprian, Luther, Leighton, and Tholuck. See Moses Margolouth, *The Lord's Prayer no Adaptation of existing Jewish Prayers* (Lond. 1876).

Paterson, capital of Passaic county, New Jersey, is on the Passaic River (which here has a perpendicular fall of 50 feet), and on the Morris Canal (connecting it with the Delaware River), 15 miles by rail NW. of New York City. It contains several locomotive-works, an iron-forge and rolling-mill, and numerous manufactories of cotton, paper, and linen and woollen goods, &c.; but chiefly it is famous for its silk-factories. These considerably exceed 100 in number, and have made Paterson 'the Lyons of America.' Pop. (1870) 33,579; (1880) 51,031; (1890) 78,347.

Paterson, ROBERT, 'Old Mortality,' was born near Hawick in 1712 or 1715, and served his apprenticeship as a stone-mason to an elder brother near Lochmaben. He married soon after 1740, and, renting a quarry for himself, took to carrying gravestones into Galloway. From about 1758 he neglected to return to his wife and five children, and for upwards of forty years devoted himself to the task of repairing or erecting headstones to Covenanting martyrs, wherever such had been buried. So Joseph Train wrote to Scott, who tells how about 1800 he himself met 'Old Mortality' at Dunnottar, engaged 'in the usual business of his pilgrimage.' From the old man's son, however, Train got a different story, without a hint of Cameronian zeal. Paterson died at Bankend, 29th January 1801, and was buried at Caerlaverock, where a monument was erected to him by the Messrs Black in 1869.

See the Introduction (1830) to *Old Mortality*, and Dr Crawford Tait *Ramage's Drumlanrig Castle and the Douglasses* (Dumfries, 1876).

Paterson, WILLIAM, the greatest commercial schemer of the 17th century, was, like Law, a Scotchman, and was born at Skipmire farm in Tintwald parish, Dumfriesshire, in April 1658. His early career is obscure, but it appears that he carried a pack through England, settled some time at Bristol, next lived in the Bahamas, whether as preacher or buccaneer, and here matured his famous Darien Scheme. Returning to Europe, he promoted his

scheme in London, Hamburg, Amsterdam, and Berlin, made a fortune by commerce in London, founded the Hampstead Water Company in 1690, and projected the Bank of England, and was one of its first directors in 1694. Paterson next went to Edinburgh, and soon talked the whole nation into his Darien Scheme. He sailed with the expedition in a private capacity, shared all its troubles, and returned with its survivors a broken man, in December 1699. But his energy remained unabated. When in 1701 William resolved to carry the contest with Louis XIV. into the heart of Spanish America, Paterson was taken into the king's confidence, and but for his death might have seen his dreams of Darien realised. He had a considerable share in promoting the union of Scotland with England, and was elected to the first united parliament by the Dumfries burghs. By a special act of parliament in 1715, he was awarded £18,241 as indemnity for his losses by the Darien Scheme; but he did not live long to enjoy it, for he died on 22d January 1719. Paterson was no mere dreamer, but a far-seeing financier, and a free-trader before free-trade times.

See DARIEN SCHEME; the *Life of Paterson*, by S. Bannister (1858), editor of his *Works* (3 vols. 1859); and W. Pagan's *Birthplace and Parentage of W. Paterson* (Edin. 1865).

Pathans. See AFGHANISTAN.

Pathology (from the Gr. *pathos*, 'disease,' and *logos*, 'a discourse') is that department of medicine which treats of the doctrine of diseases, their nature, causes, symptoms, and progress. General pathology deals with disease or morbid processes in general, and special pathology with particular diseases. Pathology is also divided into internal and external, and into medical and surgical. Pathology may be treated as falling into the departments of nosology, etiology, morbid anatomy or pathological anatomy, symptomatology, and therapeutics. Humoral pathology was based on the theory that all diseases were due to the disordered condition of the humours and fluids of the body. Cellular pathology, associated with the name of Virchow, gives prominence to the action of cells in the healthy and diseased functions of the body. See ANATOMY, DISEASE, MEDICINE, PHYSIOLOGY, and the articles on the several diseases in this work; also works on pathology by Wilks and Moxon (1875), Wagner (Eng. trans. 1876), Coats (1883), Delafield and Prudden (New York, 1885), Cornil and Ranvier (trans. 1886), Woodhead (1885), Ziegler (trans. 1883-86), Payne (1888), Hamilton (1889), Rindfleisch (trans. 1885), Sutton (1886).

Patiala, a native state in the Punjab, India, partly in the plain south of the Sutlej, partly amongst the hills near Simla. Pop. (1881) 1,467,433; area, 5887 sq. m. The capital, also called Patiala, has a pop. of 53,629.

Patkul. See CHARLES XII.

Patmore, COVENTRY KEARSEY DEIGHTON, poet, was born at Woodford in Essex, July 23, 1823, the son of P. G. Patmore, author of *Literary Reminiscences*. He published a volume of *Poems* in 1844, and three years later joined the staff of librarians in the British Museum, where he remained till 1868, when he purchased a small estate in Sussex. Soon after he settled at Hastings, where he built a large Catholic church. His second volume of poems, *Tamerton Church-tower*, &c. (1853), prepared the way for his greatest work, *The Angel in the House*, an elaborate, exquisite, and sincere poem of love from the domestic side, which has had a great popularity, but not beyond its deserts. It consists of four parts, all included under the general title for the first time in the edition of 1866: *The Betrothal*

(1854), *The Espousals* (1856), *Faithful for Ever* (1860), and *The Victories of Love* (1863). A carefully revised edition of this poem was issued in his collected poems (1878 and 1886), preceded by an essay on *English Metrical Law*, and including also *The Unknown Eros, and other Odes*, published in 1877. Patmore edited the anthology entitled *The Children's Garland* (1862), the *Autobiography* of Barry Cornwall (1877), and the posthumous poems of his son, Henry Patmore (1884). *Horilegium Amantis*, a selection from his poems, was edited by R. Garnett in 1888.

Patmos, a rocky and barren island, of most irregular outline, in the *Ægean Sea*, one of the *Sporades*, lies to the south of *Samos*, and is now called *Patino*. Area, 16 sq. m. It is celebrated as the place to which the apostle John was exiled; in a cave here, it is said, he saw the visions recorded in the *Book of Revelation*. On the top of a mountain stands the famous monastery of 'John the Divine,' built in 1038. The island is under Turkish rule, but is inhabited by about 4000 Greeks, mostly sponge-fishers. See Tozer, *Islands of the Ægean* (1890); and the Marquis of Bute in the *Scottish Review*, v. 103.

Patna, called also **AZIMABAD**, a city of Bengal, 140 miles E. of Benares by rail, extends 9 miles along the Ganges and 2 miles back from the river; but the streets are narrow and crooked, and the houses mostly mean in appearance. Apart from the Gola or government granary (1786), the government opium-factories, Patna College, the shrine of Shah Arzani, the mosque of Sher Shah, a Roman Catholic church, and a Mohammedan college, there are no buildings of moment. Its railway communication, and its central position at the junction of three great rivers, the Son, the Gandak, and the Ganges, avenues for the traffic of the North-west Provinces, render Patna of great importance as a commercial centre. The chief imports are cotton goods, oil-seeds, salt, sugar, wheat, and other cereals; they reach an annual value of nearly 4 million sterling. The exports, principally oil-seeds and salt, with cotton, spices, English piece-goods, cocoa-nuts, and tobacco, exceed 6½ million sterling in value. Patna, under its early name of *Pataliputra*, is supposed to have been founded about 600 B.C. It was visited by Megasthenes, the Greek historian, about 300 B.C., and called *Palibothra* by him. In modern times Patna is notable as the scene of a massacre of British prisoners by Mir Kasim in 1763, which led to war and annexation by the English, and for the mutiny at Dinapur, the military station of Patna, in 1857. Patna ranks as the seventh city of India in point of population: pop. (1872) 158,900; (1881) 170,654.—The district has an area of 2079 sq. m., and a pop. (1881) of 1,756,856; the *division*, an area of 23,726 sq. m., and a pop. of 15,063,944.

Patna, a native state of the Central Provinces, India; area, 2399 sq. m.; pop. (1881) 257,959. It has been under the management of a British political agent since 1871. Patna, the chief town, has a pop. of 2053.

Patois, the French term for dialects of a language spoken especially by the uneducated. See **DIALECT**.

Paton, JOHN GIBSON, missionary to the New Hebrides, the son of a stocking-maker, was born in the parish of Kirkmahoe, Dumfriesshire, 24th May 1824. After some experience in Glasgow City Mission, he offered his services for the foreign mission field in connection with the Reformed Presbyterian Church, and on his ordination he settled down towards the end of 1858 amongst the cannibal natives of Tanna. Here he laboured amidst trials and difficulties till 1862, when he was forced to leave, owing to the hostility of the natives.

For the next twenty years his work was on the neighbouring island of Aniwa, the whole population of which became Christian. Both by voice and pen he afterwards attracted public attention and sympathy towards this field of mission labour; and his brother published and edited his graphic and thrilling missionary narratives, 1st and 2d series (1890). In 1891 he was made a D.D. of Edinburgh.

Paton, SIR NOEL, painter, was born in Dunfermline, 13th December 1821, and studied for a time at the Royal Academy, London. His cartoon sketch, 'The Spirit of Religion,' gained one of the three premiums at the Westminster Hall competition in 1845. Two years thereafter his oil-picture of 'Christ bearing the Cross' and his 'Reconciliation of Oberon and Titania' jointly gained the prize of £300. The latter and its companion-picture, the 'Quarrel of Oberon and Titania,' are now in the National Gallery at Edinburgh. 'Dante Meditating the Episode of Francesca' was exhibited in Edinburgh in 1862; the 'Dead Lady' in 1864; and 'The Pursuit of Pleasure' in 1865. Scenes from fairyland and from ancient legend, and religious and mystical allegory, painted with grace, tenderness, and something of over-refinement, have made his work familiar, and have been often engraved. Among his other pictures are 'Home from the Crimea,' 'In Memoriam,' a scene from the Indian Mutiny; a series of six picture-illustrations of the 'Dowie Dens o' Yarrow,' 'Luther at Erfurt,' 'The Fairy Raid,' 'Faith and Reason,' 'Gethsemane,' 'Christ and Mary at the Sepulchre,' 'The Man of Sorrows,' 'Mors Janna Vitæ,' 'The Spirit of Twilight,' 'Thy Will be Done' (1879); 'Beati Mundo Corde' (1891), &c. He has illustrated Aytoun's *Lays of the Scottish Cavaliers*, and in 1864 he executed twenty illustrations of the *Ancient Mariner*. He is an R.S.A., was appointed Queen's Limner for Scotland in 1865, received the honour of knighthood in 1867, and in 1876 was made an LL.D. of Edinburgh. He has published two volumes of poems.

Patras, or **PATRÆ**, a fortified seaport town and the most important in the west of Greece, climbs up a hillside and spreads out at its foot on the eastern shore of the Gulf of Patras, by rail 81 miles W. by N. of Corinth and 137 W. by N. of Athens. It is a handsome city, having been almost entirely rebuilt after the ravages of the war of liberation (1821). It is defended by a citadel, is the seat of an archbishop, and has a spacious new harbour (1880) protected by a mole. It ships great quantities of currants, chiefly to Great Britain and France, the former taking from 50,000 to 60,000 and the latter from 18,000 to 38,000 tons annually. Besides currants, olive-oil, wine, valonia, &c. are exported. The imports embrace chiefly woollen and cotton goods, iron, machinery, coal. British ships import goods to the annual value of £246,400, and carry away exports to £1,173,000. Pop. (1879) 25,494; (1889) 44,970. *Patræ* is the only one of the 'twelve cities' of Achaia which still exists as a town; but most of its relics have been swept away by earthquake (551, 1820) and siege (by the Spaniards in 1532 and 1595, by the Knights of St John in 1603, and by the Greeks, 1822-23). It was an early seat of Christianity, having an archbishop before 347.

Patria Potestas. See **FAMILY, PARENT AND CHILD**.

Patriarch (Gr. *patriarchês*, 'the head of a tribe') is the name given to the heads of the families in the antediluvian period of Scripture history, and is still more familiar as the designation in Jewish history of the three progenitors of the Jewish people, Abraham, Isaac, and Jacob.

In the later history of the Jews, too, after the destruction of Jerusalem, the Greek name was used to designate the heads of the college which was regarded as a continuation of the old Sanhedrim; one of whom, the patriarch of the west, resided at Tiberias, in Galilee, and the other, the patriarch of the Eastern Jews, at Babylon. The patriarch of Tiberias was also regarded by the Roman imperial government as municipal head of the Jews of Palestine. The most familiar use of the word, however, is in the history of the Christian church. It is the name given to the bishops of certain great metropolitan sees, who not only held rank beyond other metropolitans, but also enjoyed a jurisdiction over all the metropolitans included in their district almost identical with that of the metropolitan in his own province. It is certain that the name and the office were both recognised before the Council of Nice, at which time, as we learn from the sixth canon, the patriarchal sees, acknowledged by 'ancient custom,' were three in number, Rome, Antioch, and Alexandria. After the translation of the seat of empire to Byzantium, thenceforward called Constantinople, that see, originally subject to the metropolitan of Heraclea, obtained metropolitan and afterwards patriarchal rank, and eventually established a precedence over the patriarchs of Antioch and Alexandria, being second only to Rome. The contests between the patriarchs of Rome and Constantinople were among the chief causes of the Greek Schism. To these four patriarchates was added a fifth in the year 451, that of Jerusalem, which was formed out of the ancient patriarchate of Antioch. The limits of these five patriarchates can only be loosely assigned. After the Greek Schism, and particularly after the establishment of the Latin Kingdom of Jerusalem, Latin prelates were appointed with the title and rank of patriarch in the four great Eastern sees resident at Rome; in 1847 the Latin patriarch took up his residence in Jerusalem. The Catholic Church also recognises Maronite, Melchite, and Syrian patriarchs of Antioch, an Armenian patriarch of Cilicia, and a Chaldaic patriarch of Babylon. There are also minor patriarchs of Venice, of Spain, and of the Indies. For the patriarchs of the Orthodox Eastern Church, see GREEK CHURCH.

Patrician (Lat. *patricius*, from *pater*, 'father'), a name given to the members of Roman *gentes* of whom the *populus Romanus* originally consisted, and to their descendants by blood and adoption. On the establishment of the plebeians as a distinct order, sharing certain rights with the patricians, the patriciate became an aristocracy of birth, in the exclusive possession of a number of important privileges. A long struggle between the two orders ended in the attainment by the plebeians of a political equality, and the establishment of a new aristocracy of *nobiles* based on wealth and office (see NOBILITY, ROME). Under Constantine the dignity of *patricius* became a personal title; not hereditary, but conferring very high honour and certain privileges. The popes in after times conferred the same title on eminent persons and princes; and elsewhere also the title of patrician was bestowed on distinguished subjects.

Patrick, St., a distinguished missionary of the 5th century, commonly known as the Apostle of Ireland. There is some uncertainty as to the date and place of his birth. His birth is assigned to the year 372 by Ussher (*Ecc. Brit. Antiq.*, in vi. pp. 375-380, with which compare Wh. Stokes's Introduction to *Tripartite Life of St Patrick*, p. cxxxvii., Rolls series, Lond. 1887). Of the place, it is only known for certain, from his own Confession, that his father had a small farm near

Bannavem Taberniæ; and in one of the ancient lives he is said to have been born at Nemthur. Arguing on these data, together with other collateral indications, some writers assign his birth-place to the present Boulogne-sur-Mer; others to a place on the estuary of the Clyde (called from him Kilpatrick) near Dumbarton. His father, as he himself tells, was a deacon named Calpurnius, and his grandfather, Potitus, a priest; his mother, according to the ancient biographers, was named Conches or Conchessa, and was a sister of St Martin of Tours. Patrick's original Celtic name is said to have been Succat, Patricius being his Latin designation. In his sixteenth year he was seized, while at his father's farm of Bannavem Taberniæ, by a band of pirates, and with a number of others was carried to Ireland and sold to a petty chief, in whose service he remained for six years. This chief's name was Milcuic or Milchu. He lived in the valley of the Braid near Slemish Mountain, just outside the town of Broughshane, in the centre of the County Antrim, where a town-land called Ballyligpatrick ('the town of Patrick's hollow') still preserves the memory of his residence. This district of Antrim was then famous for its piratical expeditions into Britain, as the vast finds of Roman coins all along the Antrim coast as far as Coleraine amply prove. After six years Patrick succeeded in effecting his escape, and, probably after a second captivity, went to France, where he became a monk, first at Tours and afterwards in the celebrated monastery of Lerins, which was then the residence of John Cassian, the admirer of Egyptian monasticism, and of vast numbers of Egyptian monks; hence the numerous points of contact with Egyptian customs which have been noticed in the ancient Irish Church (see IRELAND, Vol. VI. p. 210, G. T. Stokes's *Celtic Church*, p. 188, and Butler's *Coptic Churches*, passim). In the year 432 he went as a missionary to Ireland when sixty years of age, after he had been ordained by an unknown Gallic bishop named Matorix or Amatorix, or else by Germanus of Auxerre; Palladius, who had been sent by Pope Celestine as missionary to that country a short time before, having died. He seems to have been made a bishop in his forty-fifth year.

The leading facts of Patrick's life in Ireland as they are collected out of the various documents are these. He sailed from France to Wales or Ireland. The Welsh claim that he landed in Wales before he went to Ireland (see Giraldus Cambrensis, iii. 379, Rolls series). The communication, however, between Wales and the east coast of Ireland has been very frequent from the earliest ages. He first landed as a missionary in Ireland at the town of Wicklow at the mouth of the river Vartry; thence he sailed north to convert his old master Milchu, who destroyed himself at his approach. Milchu was a chief of Northern Dalriada, a district which extended from the middle of Antrim to Newry. In the County Down, in the south of the same Dalriada, he converted another chief named Dichu, who bestowed upon him the first Christian church that St Patrick possessed. It was called Sabhall (Saul) or 'the barn,' and it is still a church called by exactly the same name. St Patrick then set out to Tara in the County Meath, which was at that period the central point of meeting for all the tribes of Ireland. There he preached to the king of Tara, Laoghaire, or Leary (as the name should be pronounced), where Patrick is said to have used the shamrock to illustrate the doctrine of the Trinity; this is, however, a mere modern legend. Thence he proceeded to Connaught, as far as Croagh-Patrick in Mayo, to Ulster, and as far as Cashel in the south. We can trace his footsteps in all these directions by the topography of the country as well as by the documents which are extant. His mission was eminently

successful. He adopted the expedient of addressing himself first to the chiefs, and of improving, as far as possible, the spirit of clanship and other existing usages of the Irish for the furtherance of his preaching; nor can it be doubted that he had much success in Christianising the ancient Irish system of belief and of practice. According to the accounts of his Irish biographers, he founded 365 churches and baptised with his own hand 12,000 persons. He is said also to have consecrated 450 bishops, ordained a vast number of priests, and to have blessed very many monks and nuns. After he had been some twenty years engaged in his missionary enterprise, he is said to have fixed his see at Armagh about the year 454, where he held probably more than one synod, the decrees of which have been a subject of much controversy. He died at Saul, the spot which Dichu had given him on his first arrival, and was buried at Downpatrick, where his relics were preserved down to the period of the Reformation. The place is still venerated by the people. The date of his death is much disputed, the Bollandists placing it in 460, while Ussher holds it to have been 493. Dr Todd inclines strongly to the latter opinion, in which case Patrick's age would have been quite 120. The only certainly authentic literary remains of St Patrick are his 'Confession' and a letter, both of very rude Latinity, but of much historical interest. The letter is addressed to Coroticus, by some supposed to have been a Welsh chieftain named Caradoc (from whom Cardigan is named), by others regarded as a pirate chief from near Dumbarton (W. Stokes's *Tripartite Life of St Patrick*, Introd. p. c.), who had made a descent on the Irish coast, and slain or carried off, with circumstances of great cruelty, a number of the Irish, many of whom were neophytes. These, with some other remains ascribed to him, as also decrees of synods, were published in Wilkins' *Concilia*, and separately by Ware, *Opuscula S. Patricii* (1656). The Book of Armagh is in MS. in Trinity College, Dublin, dating from the 8th century. The copy in it of St Patrick's Confession claims to have been made from St Patrick's autograph. For this MS., see Stokes's *Celtic Church*.

A good biography of St Patrick is that of the Rev. J. H. Todd (Dublin, 1863); a more recent one is by E. J. Newell (1890). The best and latest edition of all the documents concerning St Patrick is Dr Whitley Stokes's two vols. in the Rolls series (1887) styled the *Tripartite Life of St Patrick*, where every fragment bearing upon his history has been industriously gathered and critically estimated. Dr Whitley Stokes has there printed the documents from the Book of Armagh which are the earliest authentic notices of the saint, and the foundation upon which all later lives have been built.

Patrick, SIMON, a learned English divine, born at Gainsborough in Lincolnshire, 8th September 1626, was educated at Queen's College, Cambridge, and was successively rector of St Paul's, Covent Garden (1662), where he laboured heroically through the horrors of the Great Plague, Dean of Peterborough (1678), Bishop of Chichester (1689) and of Ely (1691). He died May 31, 1707. A theologian no less devout than erudite, an ecclesiastic of wide sympathies and large sagacity, he established a solid reputation by his excellent sermons, of which may be selected for special mention that preached at the funeral of John Smith of Cambridge, printed with Smith's *Select Discourses*; his admirable if sometimes prolix devotional and expository treatises, some of which are still read; and his sound and frequently reprinted paraphrases and commentaries on the historical and poetical books of Scripture from Genesis to Canticles (10 vols. 1695-1710). Of the expository works may here merely be named *A Brief Exposition of the Ten Commandments and the Lord's Prayer, The Parable*

of the Pilgrims, The Heart's Ease, The Christian Sacrifice, Advice to a Friend, The Devout Christian Instructed, and Jesus and the Resurrection Justified. His *Autobiography* was first printed at Oxford in 1839, and is included in the complete Oxford Clarendon Press edition of his works, edited by the Rev. Alexander Taylor (9 vols. 1858).

Patrick, THE MOST ILLUSTRIOUS ORDER OF ST., a national order of knighthood for Ireland, established by George III. on the 5th of February 1783, and enlarged in 1833. It now consists of the Sovereign, the Grand-master (the lord-lieutenant of Ireland for the time being), and twenty-two Knights. The *Collar* of the order (of gold) is composed of roses alternating with harps, tied together with a knot of gold, the roses being enamelled alternately white within red, and red within white; and in the centre is an imperial crown surmounting a harp of gold, from which the badge is suspended. The *Badge or Jewel* is of gold, and oval; surrounding it is a wreath of shamrock proper on a gold field; within this is a band of sky-blue enamel charged with the motto of the order, *QUIS SEPARABIT MDCCCLXXXIII*, in gold letters; and within this band a saltire gules (the cross of St Patrick), surmounted by a shamrock or trefoil slipped vert, having on each of its leaves an imperial crown or. The field of the cross is either argent or pierced and left open. A sky-blue *Ribbon*, worn over the right shoulder, sustains the badge when the collar is not worn. The *Star*, worn on the left side, differs from the badge only in being circular in place of oval, and in substituting for the exterior wreath of shamrocks eight rays of silver, four of which are larger than the other four. The order is indicated by the initials K.P.

Order of St Patrick.

Patripassians (Lat. *pater*, 'father,' and *passus*, 'suffered'), a name given to one of the earliest classes of anti-Trinitarian sectaries (2d century), who, in maintaining the oneness of the Godhead, were said by their enemies to believe that, as it was true to say that Jesus, in whom dwelt the Logos, or the Son, suffered, therefore it would be true to say that the Father suffered. Their principles are in the main the same with those of the Sabellians (q.v.).

Patristic Literature. See **FATHERS OF THE CHURCH**, and separate articles.

Patroclus. See **ACHILLES**.

Patron (Lat. *patronus*, from *pater*, 'father'), among the Romans originally signified a citizen who had dependents, who were called *clients*, attached to him. Before the time of the Laws of the Twelve Tables, the most frequent use of the term *patronus* was in opposition to *libertus*, these

two words being used to signify persons who stood to one another in the relation of master and manumitted slave. The original idea of a patron apart from the manumitter of slaves continued to exist. A Roman citizen, desirous of a protector, might attach himself to a patron, whose client he thenceforward became; the patron was the guardian of his client's interest, public and private; as his legal adviser he vindicated his rights before the courts of law. The client was bound on various occasions to assist the patron with money, as by paying the costs of his suits, contributing to the marriage portions of his daughters, and defraying in part the expenses incurred in the discharge of public functions (see *ROME*). As the patron was in the habit of appearing in support of his clients in courts of justice, the word *patronus* acquired in course of time the signification of advocate or legal adviser and defender, the client being the party defended. *Patron* in after times became a common designation of every protector or powerful promoter of the interests of another; and the saints who were believed to watch over the interests of particular persons, places, trades, &c. acquired in the middle ages the designation of their patron saints.

The term *Patron* has also been applied to those who endowed or supported churches and convents. The question of ecclesiastical patronage, or the right of the patron to present to livings, is dealt with in *ADVOWSON*, *FREE CHURCH*, *INVESTITURE*, *SCOTLAND (CHURCH OF)*, *STATE CHURCH*.

Patterson-Bonaparte. See *BONAPARTE*, Vol. II. p. 288.

Patteson, JOHN COLERIDGE, the martyr-bishop, was born in London on 1st April 1827, the son of Sir John Patteson, judge in the Queen's Bench, and of a niece of Coleridge the poet. He passed through Eton and Balliol College, Oxford, and was elected a Fellow of Merton in 1852, and in the following year appointed curate of Alington, near Ottery St Mary, in Devonshire. But his thoughts soon turned to missionary work, and in 1855 he sailed with Bishop Selwyn of New Zealand. The next sixteen years he spent amongst the Melanesian Islands—New Hebrides, Banks, Solomon, and Loyalty Islands; and in 1861 he was consecrated Bishop of Melanesia. A most unselfish man and a true Christian, he was greatly beloved by the islanders, whom he likewise loved and faithfully watched over, protecting them to his utmost against the white kidnappers of the Pacific. He was killed by the natives of Nukapu, one of the Santa Cruz group, on 20th September 1871, it is believed in revenge for relatives carried away by the white 'slavers.' See *Life* by Miss Yonge (2 vols. 1874).

Patti, ADELINA, prima-donna, was born at Madrid, 19th February 1843, the daughter of a Sicilian tenor and the 'Signora Barilli,' a Roman. At seven she sang 'Casta Diva' in Tripler Hall, New York; and in the same city she made her operatic début as 'Lucia' in 1859. In London she first appeared in 1861 as 'Amina' in *La Sonnambula*, when her success was as splendid as it had been in America, and as it since has been wherever she has sung—Paris, St Petersburg, both the Americas, &c. In Russia, in 1870, she received from the emperor the Order of Merit. Her voice is an unusually high soprano, reaching to F in alt, of rich bell-like tone and remarkable evenness; to these qualities she adds purity of style and the highest artistic finish. Equally at home in the tenderness of deep passion and the sprightly vivacity of comedy, she has also sung splendidly in oratorio. She married in 1866 the Marquis de Caux, and, on her divorce from him in 1886, the tenor Ernesto Nicolini. Her home

is Craig-y-nos Castle, near Swansea.—Her elder sister, CARLOTTA, born at Florence in 1840, was likewise a very fine vocalist, though a slight lameness prevented her from appearing much in opera. She made her début at New York as a concert-singer in 1861, married in 1879 the 'cellist Ernst de Munck, and died at Paris, 28th June 1889. See Engel's *From Mozart to Mario* (1886).

Pattison, MARK, scholar, was born in 1813 at Hornby in Yorkshire, but brought up mostly at Hauxwell, of which parish his father had become rector. The eldest of twelve children, of whom ten were daughters, he grew up amid the Yorkshire moors, with a close knowledge of nature and a love for field-sports, which in the one form of fishing lingered with him till the last. He was educated at home until he entered Oriel College at Oxford in 1832. A shy and awkward lad, diffident and hesitating, without the wholesome discipline of public school life, he suffered much in his first years as an undergraduate, but his sufferings were the fruit of his own lack of self-reliance, his morbid self-consciousness, and hyper-sensitiveness of temperament. He took his bachelor's degree in 1837 with a second-class in classics, and was elected Fellow of Lincoln College in 1839. Under the dominant influence of Newman he gave himself first to the study of theology, twice (1841–42) carried off the Denyer prize, wrote two *Lives of the Saints*, translated for the 'Library of the Fathers' the Matthew in the *Catena Aurea* of Aquinas, and almost followed his master into the fold of Rome, being saved only, as he himself explains, by his habits of study and a constitutional slowness to act. Fortunately we have his own account of his spiritual growth, out of the Puritanism of his home into the wider atmosphere of Anglicanism, and how that in its turn fell from him as the larger horizon of the Catholic Church opened itself up before his eyes, only to disappear before 'the highest development, when all religions appear in their historical light as efforts of the human spirit to come to an understanding with that Unseen Power whose presence it feels, but whose motives are a riddle.' His reaction from Newmanism: reawakened within him all his zeal for pure scholarship, and, no less lofty in his ideal of the teacher than the student, he soon became a tutor of altogether exceptional devotion and influence, and acting head of the college as sub-rector, under the aged Dr Tatham. On the death of the latter in 1851 Pattison was kept out of the headship which was his right by a discreditable obscurantist intrigue, which gave an almost paralysing blow to his sensitive nature. A further unsuccessful attempt was made to deprive him of his fellowship on the technical plea that he had not proceeded in time to the degree of B.D., and the result of his disappointment was that for ten years he took little real interest in the life of Oxford, while his ideas of university reform henceforth grew rather towards an increase of the professorial than the tutorial system. But his educational sympathies soon extended far beyond mere college life; he published an article on education in the *Oxford Essays*, acted as assistant-commissioner on the Duke of Newcastle's Commission of Inquiry into Elementary Education in Germany, rambled in the long vacations through England, Scotland, and Germany, visiting most of the universities of the latter country, and served for three months of 1858 as *Times* correspondent at Berlin. Meanwhile he gave himself with rare devotion to severe and unbroken study, and scholars soon came to recognise his Roman hand in the columns of the *Quarterly*, the *Westminster*, and the *Saturday Review*. His luminous and thoughtful *Report on Elementary Education in Protestant*

Germany appeared in 1859; his equally learned and temperate paper on 'Tendencies of Religious Thought in England, 1688-1750,' in *Essays and Reviews* (1860). At length in 1861 he was elected Rector, but, though he made an exemplary head, the spring and elasticity of earlier days were gone. In 1862 he married the accomplished Emilia Frances Strong, afterwards Lady Dilke, who helped him to make Lincoln a social and intellectual centre for a world much wider than the walls of Oxford. Down to his last illness and his death at Harrogate, 30th July 1884, he lived wholly for study, maintaining a mediæval rather than modern ideal of the life of the scholar as a sufficient end in itself.

Everything Mark Pattison wrote was characteristic; nowhere else among contemporaries could be found such fullness of knowledge and earnestness of thought, shaped ever into terse and vigorous English. Yet his standard of perfection was so high that his actual achievement is far more suggestive than demonstrative of his powers, and the greatest project of his life—the study of Scaliger—remains a fragment, printed by Professor Nettleship in vol. i. of Pattison's collected *Essays* (1889).

Besides the books already named he published *Suggestions on Academical Organisation* (1868); admirably annotated editions of Pope's *Essay on Man* (1869) and *Satires and Epistles* (1872); *Isaac Casaubon, 1559-1614* (1875), which grew out of his Scaliger studies; *Milton*, almost the best book in the 'English Men of Letters' series (1879); the *Sonnets of Milton* (1883); and *Sermons* (1885). His posthumous *Memoirs* (1885) was a strikingly frank judgment of himself and others—even his own father—and a remarkable revelation of a singular moral and intellectual personality, describing, 'without restraint, the whole current of his thoughts and feelings from 1832 to 1860.'

DORA WYNDLOW PATTISON, his sister, was born at Hauxwell, January 16, 1832, the youngest but one of her father's family. She grew up amid her native Yorkshire moors a handsome and healthy girl of remarkable humour, spirit, and vigour, and had her young enthusiasm kindled by the heroic devotion of Florence Nightingale. In October 1861, against the advice of all her family, she started a life of labour for others as schoolmistress at Little Woolston, near Bletchley, and in the autumn of 1864 joined the sisterhood of the Good Samaritans at Coatham, near Redcar. Here 'Sister Dora' underwent severe discipline, but found solace in devoted labours as a nurse, first at North Ormesby, near Middlesborough, and in 1865 at Walsall. Ere long she gave herself entirely to hospital work, and her absolute self-forgetfulness, patience, gentleness, and skill quickly brought her the adoration of the saint from the rough men and women for whom she gave her life. The severest toil, and even the horrors of smallpox in 1868, and anew in 1875, she braved with the serene enthusiasm of her nature, and hundreds of the most brutalised drunkards and harlots of the Black Country were lifted by the example of her life and the magnetic influence of her personality into new and undreamt of horizons of moral and religious duty. But even her uncommon strength at last gave way, and she died a true martyr for Christ's sake at Walsall, December 24, 1878. The whole population of the town followed her body to the grave, and the working-men erected a monument to her memory in 1886.

See *Sister Dora: A Biography*, by Margaret Lonsdale (1880)—a sincere and veracious book, which Mark Pattison, with a characteristic touch, terms 'Miss Lonsdale's romance.'

PAU, the chief town of the French department of Basses-Pyrénées, on the right bank of the Gave-de-Pau, 66 miles by rail ESE. of Bayonne and 143 SSE. of Bordeaux. It occupies a rocky height,

623 feet above sea-level, and commands towards the south most magnificent views of the serrated Pyrenees; indeed, for mountain scenery its situation is surpassed by no other town in France. The ancient capital of the kingdom of Béarn and French Navarre, it has a noble five-towered castle, rising to a height of 110 feet. Rebuilt about 1363 by Gaston Phœbus, Comte de Foix, and restored by Louis-Philippe and Napoleon III., this castle was the birthplace of Henri IV., as also of his mother Jeanne d'Albret; and Abd-el-Kader was a prisoner here in 1848. Bernadotte was likewise a native of Pau, which, beyond a statue of King Henri (1843), has nothing else calling for notice. Linen and chocolate are its chief manufactures; and in the vicinity Jurançon wine (good but strong) is grown, and many swine are fed, whose pork supplies the famous 'Jambons de Bayonne.' Pau is a great English resort, especially during the winter season (October to May), and is famous for its golf-links. Pop. (1872) 25,607; (1886) 28,864. See Count Henry Russell, *Pau, Biarritz, and the Pyrenees* (new ed. 1891).

Paullac, a port on the left bank of the estuary of the Gironde in France, 30 miles N. by W. of Bordeaux by rail, is the place from which the best brands of Médoc (claret) are shipped to Bordeaux. Pop. 2216.

Paul. It is probable that no man ever swayed the religious opinions and destinies of mankind so powerfully as Paul of Tarsus, the Apostle of the Gentiles. He was greater than some of the greatest servants of Christ in many single capacities; a greater preacher than Chrysostom, a greater missionary than St Francis Xavier, a greater theologian than St Thomas of Aquinum, a greater reformer than Luther, a greater organiser than St Gregory the Great. Collectively he exercised over the world a mightier influence not only than all of these put together, but even than his fellow apostles St Peter and St John. The secrets of his unparalleled success were—regarded on their human side—the secrets of all success in the field of religious effort—burning zeal, absolute self-sacrifice, undaunted courage, and a strong conviction that he was fulfilling a ministry to which he had received a special call from God.

Our chief and all but exclusive authorities for his life are the Acts of the Apostles and his own epistles. The few particulars added by Christian tradition are highly dubious, and the calumnious inventions of Talmudic malice and Ebionite heresy may be dismissed with silent contempt. Paley in his *Horæ Paulinæ* has shown with wonderful skill and originality how remarkably the credibility of St Luke's history is supported by authentic touches of autobiography, even in cases where there is a seeming and superficial discrepancy. He shows us that even the undesigned coincidences can be counted by scores. From combination of the two sources we are able to arrive at a true picture and estimate, though both are entirely fragmentary. The life of St Paul is like a manuscript of which the beginning and end are irrecoverably lost. All that we really know of his life lies in the thirty years between 36 A.D. and 66 A.D., which form its central period. We can only form slight and uncertain conjectures respecting Paul's childhood, youth, and early manhood, and respecting all that befell him after St Luke drops the curtain upon his first Roman imprisonment with the words, 'teaching with all boldness unmolestedly.' But even in this central period the records are quite fragmentary. In 2 Cor. xi. 24-33, written about 57 A.D., some ten years before his death, St Paul briefly alludes to the strange and severe diversity of his trials; and yet of those which he mentions

no less than eleven specific trials are not so much as alluded to in the Acts. St Luke does not mention one of the five scourgings with Jewish thongs; only one of the three flagellations with Roman rods; not one of the three shipwrecks, though he minutely describes a fourth. He makes no allusion to the 'night and day in the deep,' and only mentions two of what Clement of Rome tells us were seven imprisonments. Nor, again, does St Luke refer to any one of the perils of watercourses, perils of robbers, perils in the wilderness, perils among false brethren, hunger, thirst, fasting, cold, and nakedness, for which we can only find places in the travels of the apostle by reproducing in imagination the character of the countries through which he made his long and toilsome journeys.

St Jerome, perhaps following a true but confused and anachronistic tradition, says that St Paul was born at Giscala in Galilee, and taken by his parents to Tarsus of Cilicia in early infancy. The conjectural date of his birth is about 3 A.D. Tarsus was at that time 'no mean city.' It was beautifully situated on the river Cydnus, and was a centre not only of political power and commercial enterprise, but also of learning and philosophy. He grew up in the midst of paganism, but was trained 'a Hebrew of the Hebrews,' in profound acquaintance with the Jewish Scriptures, and with some slight knowledge of classical literature. Being of the tribe of Benjamin, he received the famous tribal name of Saul. Tarsus was only an *urbs libera*, but in some unknown way St Paul was a Roman citizen, and it has been conjectured that his father may have been one of the Tarsians carried by Cassius to Rome, and may there have obtained the *civitas*. He was sent, probably as a boy, to relatives at Jerusalem, where in after days he seems to have had a married sister. He there became an illustrious and learned Pharisee of the famous school of the Rabban Gamaliel (q.v.), a grandson of the sweet and noble Hillel. At the feet of this eminent doctor he sat for many years, endeavouring to attain to the legal blamelessness which was the ideal of Pharisaic virtue, but which could give little satisfaction to his deepest yearnings. It was hardly wonderful that he should have imbibed the spirit of fanatical hatred against that new and immeasurable force of the gospel, which to a Pharisee seemed to involve the overthrow of all his most cherished idols and formalities. If, as he seems to imply, he had a vote in the Sanhedrin (Acts, xxvi. 10), he must have been married; and from the context of 1 Cor. vii. 8 it has been inferred that he was a widower, and remained a widower by choice (1 Cor. ix. 5). Gamaliel approved of the wise policy of toleration; but Saul, less wise herein than his teacher, was hurried by what he himself afterwards and remorsefully described as a spirit of frenzied rage (Acts, xxvi. 11) into the attitude of a most violent persecutor. He haled men and even women to prison, hunted them out for punishment through every synagogue, scourged them (Acts, xxii. 4), voted for their execution, and did his best to make them blasphemers. The persecution culminated in the martyrdom of St Stephen by stoning, and on this occasion the executioners laid their garments at the feet of Saul. Fanaticism enabled him to witness that horrible death, but he was haunted long years afterwards by the memory of the angel face (Acts, vi. 15), the light of which he had seen quenched in blood (Acts, vii. 58-60, xxii. 20; 1 Cor. xv. 9; Gal. i. 13).

When he had finished his bad work as an inquisitor at Jerusalem, and had, as he hoped, extirpated the odious sect of Nazarenes, he obtained letters of authorisation from the high-priest, and went as

commissioner of the Sanhedrin to root them out from Damascus. On his journey he met the crisis of his fate. He was, as he regarded it, arrested—apprehended by Christ, dashed to the ground, taken captive, led in triumph, branded as a slave with the stigmata of the Lord Jesus, when the dazzling vision, which outshone the Syrian noon, wrapped him as in a blinding sheet of flame, and filled him with the unalterable conviction that he had both seen and heard his risen Lord. From that moment he was a changed man. He felt that the fire of God had melted the iron sinews, and the hammer of God had shattered the stony heart. What is certain is that from that time forth the proud man became utterly humble, and the fierce persecutor a tender-hearted evangelist. The hard and self-sufficient Rabbi, abandoning for ever his national arrogance, his rabbinic wisdom, his legal scrupulosity, became thenceforth the suffering and despised preacher of an execrated faith.

It is needless to follow in detail the further narrative of the Acts or the personal indications of the epistles. Healed by Ananias of his temporary blindness, he retired for about three years to Arabia, and then returning to Damascus began powerfully to preach the gospel which he had heretofore toiled to destroy. Driven from Damascus by Jewish animosity, he contrived to escape down the city wall in a basket, and made his way to Jerusalem, where, as was natural, he was received with coldness and suspicion, until Barnabas generously intervened to remove the prejudices of the brethren. After a trance and vision in the temple, in which his future destiny was foreshadowed to him, he was driven to Tarsus by a plot to murder him, and there he stayed with his family, waiting and preparing for his work. Meanwhile the capital of Christianity was being gradually transferred from Jerusalem to Antioch, and Barnabas, realising the importance of the vast sphere of labour which was there opening before him, set out to seek Paul as his fellow-labourer. At Antioch he laboured for a year with ever-widening influence, and went to Jerusalem with Barnabas in the year 44 to carry contributions to the necessitous mother-church. Soon after his return began the first stirring of the missionary spirit, and Barnabas and Saul were set apart by divine consecration to preach Christ to the Jew first and afterwards to the Gentile. They set forth accompanied by Mark, who was the cousin (Col. iv. 10) of Barnabas, and sailed to Cyprus, where they converted the proconsul Sergius Paulus, and confounded the false prophet Elymas, by whom he had been duped. From that time Saul assumes the Gentile name of Paul. Thence they sailed to Perga, and travelled through the passes of the Taurus to the Pisidian Antioch. Driven from thence, and afterwards from Iconium, by the jealous fury of the Jews at the success of their preaching among the Gentiles, they went to Lystra, where, healing a cripple, they were at first taken for gods; but a revulsion of feeling against them was again caused by the Jews, and Paul was stoned and left for dead. It is probable that he carried with him to the grave the marks of this cruel martyrdom; but at Lystra he had the happiness of winning a young convert named Timotheus, the beloved son and companion of many later trials and travels, even to the end of his life. From Lystra they fled secretly to Derbe, and thence retraced their steps to Antioch, appointing in each place elders over the infant churches. Such was the first flight of the eagle, the first journey of Christian missionaries. It confirmed Paul in his destined work as the Apostle of the Gentiles.

Shortly after their return to the Syrian Antioch the church began to be troubled by the Pharisaic

converts, who wished to reduce Christianity to the level of a local faction by forcing on Gentile converts the crushing yoke of Jewish circumcision. It is difficult after the lapse of ages to estimate the daring courage and originality which it then required to pronounce obsolete and abrogated, and to characterise as 'weak and beggarly elements,' what all Jews regarded as the infinitely sacred and eternally inspired institutions of that Mosaic ceremonialism which had covered religion with the scurf of petty obligations indefinitely multiplied by tradition and the oral law. But Paul took this part boldly and decisively from the first and at all costs—willingly facing the obloquy heaped upon him as a renegade and a seducer of the people—he carried out to the end the indignant battle which saved Christianity from being degraded into a narrow sect and made it the universal religion of spiritual freedom. It was necessary for Paul and Barnabas to visit Jerusalem to obtain from the first church synod the decision of this great question, and the victory gained in that synod, mainly by the genius of St Paul aided by the manly convictions of St Peter, is the most momentous in the history of early Christianity. It was indeed only a partial victory in the form of a local decision; but it practically conceded the main point of issue, and enabled St Paul to enforce on reluctant Judaists the emancipation of their Gentile brethren from a host of worrying restrictions, which, if unabolished, would have been justly fatal to the spread of Christianity. How strained were the relations between the two divisions of the church we see from the fact that shortly afterwards at Antioch Paul had to rebuke even the chief of the apostles publicly for something like tergiversation, into which he had been led for a moment by fear of his Jewish co-religionists. This was never forgotten, and we see from the Pseudo-Clementine writings that perhaps a century later there were Judaising heretics who because of it dared to indulge in malignant calumnies against St Paul.

It was shortly after this memorable scene that St Paul's missionary ardour led him to propose to Barnabas another evangelistic journey. The wish of Barnabas to take with him his cousin Mark, and Paul's disinclination to admit the companionship of one who in his judgment had put his hand to the plough and looked back in the first journey, led to a sad disagreement between the two friends. This ended in a life-long separation, though much later Paul desired the presence of Mark at Rome because he found him profitable for the ministry. Paul, with Silas as his companion, went through the Cilician Gates to Derbe and Lystra. At Lystra he circumcised and ordained Timothy, who continued to be his dearest companion for many years. Thence they went through Phrygia and Galatia, preaching and founding churches. In Galatia Paul had a severe illness, in which he was cheered by the bright enthusiasm of his Galatian converts. Thence, by providential intimation, they were led to Troas, and there St Paul was joined by St Luke, and saw the vision of the 'man of Macedonia,' which led to the momentous decision to carry the gospel into Europe. They sailed to Neapolis, and were received at Philippi by the generous hospitality of Lydia. The church here founded was the most beloved by St Paul of all his infant communities. The healing of the girl with 'a spirit of divination' led to an uproar, in which Paul and Silas were unjustly and illegally scourged and imprisoned. An earthquake in the night alarmed the Philippian prætors, and the two prisoners, who had converted their gaoler, were honourably dismissed. They went to Thessalonica, and founded another church, where Paul, who was

generally able to support himself by his trade of tent-maker, was aided by the generous Philippians. Another riot, stirred up by Jewish jealousy, compelled their flight to Berea, from which St Paul was again driven by Jewish machinations, and made his way to Athens. He preached on the Areopagus amid the jeers of Stoics and Epicureans, but won some important converts, and proceeded to Corinth. There, with the aid of his fellow tent-makers, Aquila and Priscilla, he founded an important church; but another riot arose in which both Jews and Greeks were involved, which was treated with disdainful indifference by the proconsul Gallio, the brother of Seneca.

After a stay of some months at Corinth, he revisited Jerusalem (his fourth visit), touching at Ephesus on the way. After saluting the church at Jerusalem he went back to Antioch, whence, after a period of rest, he started on his third great missionary journey. He confirmed the churches of Galatia and Phrygia, and then went to Ephesus, where he made a full convert of the eloquent Apollos, and stayed for two years. The immense success of his preaching led to the riot of the silversmiths in the theatre. Compelled to fly, he made his way to Troas and retraced his steps through Macedonia as far as Illyricum, and thence to Corinth. It was during this period that he wrote his most important group of epistles. He was greatly occupied also in raising a contribution for the perennial destitution of the mother-church at Jerusalem, which was taken thither by chosen delegates of the contributing churches. A sudden plot of the Jews to murder him compelled him to return through Macedonia. He spent the Passover with Luke at Philippi, sailed to Troas, where he raised Eutychus from death, and then among the isles of Greece to Miletus, where he had an affecting parting with the elders of the Ephesian Church. A voyage past Coos, Rhodes, and Patara brought him to Tyre, where he was warmly welcomed by the church, and parted from them in prayer on the seashore. At Cæsarea he stayed in the house of Philip the Evangelist, and thence, in spite of the warnings of the prophet Agabus, went up to Jerusalem for his fifth visit. He was the guest of Mnason of Cyprus, and was received by James, the Lord's brother, and the elders, to whom he handed over the Gentile contributions, in accordance with the old instructions of the synod of Jerusalem, 'to be mindful of the poor.' Afraid that his presence in the Holy City might arouse tumults among the Jewish fanatics, St James suggested to him that he should take a share in the expenses of a Nazarite vow. The suggestion turned out unfortunately. He was recognised in the Court of the Women, and charged with having taken Trophimus, a Gentile Ephesian, into the temple. He was rescued from the brutal fury of the mob by the chief captain Lysias, who, taking him for an impostor, was on the point of having him scourged, when he discovered that he was a Roman citizen. Under the protection of the Romans he was tried before the Sanhedrin, but threw the assembly into a tumult by taking advantage of the rivalry between the Pharisees and Sadducees. Amid these perils a vision assured him that he should yet preach the word in Rome. Discovering that forty Jews had bound themselves under a curse to assassinate Paul, Lysias sent him to the procurator Felix at Cæsarea. He was tried before Felix, and made a deep impression; but, as he had no money to bribe the avaricious governor, he was left two years in prison. He was then tried afresh by the fair and energetic Festus, who also gave him an opportunity of pleading his cause before King Agrippa II. and Berenice. Weary, however, with the long and unjust detention, he had appealed to Cæsar, and

Festus sent him, in charge of the centurion Julius, to Rome. St Luke, who, with Aristarchus, was his companion, gives us a minute account of the voyage to Myra, and thence in an Alexandrian wheat-ship to Crete, where they lay windbound at Fair Havens. Continuing the voyage in spite of Paul's warning, the crew were caught in a cyclone called Euro-aquilo, and the ship, in spite of undergirding and every other precaution, became a complete wreck. Amid the despair and misery of all on board, St Paul, comforted by a vision, assured them of their safety, and though the vessel finally became a total wreck at Ras el Koura, in Malta, every life was saved. At Malta he waited three months for another ship. He was held in great honour by the barbarous natives because he had shaken a viper off his hand unhurt, and healed the father of Publius, the Protos of Malta. The prisoners were taken to Italy on board the *Castor and Pollux*, and landed at Puteoli, proceeding by land to Rome. Paul was met by Christian brethren at Appii Forum and the Three Taverns, and went along the Appian Road to the capital, where he was handed over to the *observatio* of Afranius Burrus, the prætorian prefect. For two years he continued a prisoner at Rome, and, as the Jews refused to accept his preaching, he did what he could to make the gospel known to the Gentiles, gaining converts even among the prætorian soldiers and the slaves of Cæsar's household, and being suffered to live in his own hired apartment, under the supervision of the soldiers. From the pastoral epistles we securely infer that his trial ended in a complete acquittal. His next movements are uncertain, but we find traces of his probable visits to Colossæ, Crete, and Nicopolis, and of his final arrest in the house of Carpus at Troas. He seems to have been tried and imprisoned at Ephesus, and again sent to Rome. Meanwhile the Neronian persecution had broken out, and his second imprisonment, in which nearly all deserted him, was far more imperilled and miserable than the first.

At his first trial—perhaps before Nero in person—he seems to have been remanded; but at a second trial we learn from unanimous Christian tradition that he was condemned to martyrdom, probably, as he was a Roman citizen, by decapitation. His 'trophy,' or martyr's memorial, was a familiar object in Rome in the 2d century, but his death was so lonely and unrecorded that not even tradition has preserved a single trustworthy detail respecting it. All that we can see from his last writings is that he remained heroic, indomitable, cheerful, faithful to the end, never doubting, amid an apparent failure which the world might well have regarded as absolute, that the hundredfold harvest of eternity would spring up from the grain which he had sown in tears. Yet it is unlikely that even he, on this side the grave, was at all able to estimate the far-reaching grandeur and many-sidedness of the work which it had been given him to do. He had set an example of lifelong zeal and devotion in the willing endurance of numberless perils and privations, such as has never been equalled, much less surpassed; and he had done this with a mind acutely sensitive to the blasts of hatred which came to him from every region of the Jewish and Gentile world, and with a body weakened by chronic disease. He had formulated the language and systematised the doctrines of theology. He had saved the gospel from dwindling into a Pharisaic Judaism, and had established for ever its freedom from the yoke of priestly and ceremonial bondage. He had carried the faith over a vast extent of Asia from Jerusalem to Antioch, to Ephesus, to Macedonia, to Athens and Corinth, to Rome, and perhaps even 'to the farthest limit of the west.' He had been the founder

of many flourishing churches. He had written epistles of various orders, of which even the most casual is 'weighty and powerful,' and which constitute him one of the greatest moral and spiritual teachers whom the human race has ever seen.

It only remains to glance at these epistles. They are thirteen in number, and fall into four well-marked chronological and doctrinal groups. The first group (1, 2 Thess., written 52–53 A.D., during the second missionary journey) are mainly eschatological, and represent St Paul's earliest stage of thought. The second group, written during the third missionary journey, may be called broadly epistles of Judaic controversy. 1 Corinthians (written at Ephesus in 57) is mainly polemical and ecclesiastical. 2 Corinthians (written at Philippi in 58) is the apostle's *Apologia pro Vita Sua*. Galatians and Romans (written at Corinth in 58) are mainly doctrinal and soteriological. The third group are the epistles written during St Paul's first imprisonment at Rome. Philippians (62) is personal and ethical. Colossians and Ephesians (63) are Christological, Ephesians being especially the epistle of the ascension. Philemon is an exquisite personal epistle, the first charter of emancipation, and was written (63) as a sort of annex to the Epistle to the Colossians. The fourth group contains the pastoral epistles of St Paul's closing years. 1 Timothy and Titus may have been written in Macedonia about 66, 2 Tim. about 67 in Rome.

They may also be classified according to their forms, as (1) Circular letters to the churches (Eph. and Romans), which are rather treatises than letters; (2) Letters to special churches, or little groups of churches (1 and 2 Thess., 1 and 2 Cor., Philip., Col., and Gal.); (3) Letters to friends (Philemon, Titus, 1 and 2 Tim.).

The genuineness of some of these epistles has been fiercely contested. Four (1 and 2 Cor., Gal., and Romans) are absolute *homologoumena*, of which not even the school of Tübingen questioned the genuineness; but they regarded 1 and 2 Thess., Philippians, Ephesians, Colossians, and Philemon as *antilegomena*, of uncertain authenticity, and the three pastoral epistles as spurious. The Christian church has amply met the arguments against the authenticity of all the epistles, and even Renan only rejects the pastoral epistles, and that mainly on historic and chronological grounds, because with many others he holds that St Paul perished in the Neronian persecution in 64 A.D.

The mission of St Paul was fourfold. Had he done nothing more than set the world an example of saintly self-sacrifice, his work would have been sufficiently memorable to make him immortal; but besides this he was a missionary, a moralist, a reformer, and a theologian.

(1) Of his missionary work we have spoken, and have shown that to him pre-eminently belongs the honour of having made known the gospel to the civilised world around the basin of the Mediterranean; so that before his death the Christians had grown from a little community of 120 Galileans in an upper room at Jerusalem into a number of flourishing Asiatic and European churches, and even in that early day Christ had His followers in the Prætorian camp at Rome, and in Cæsar's household.

(2) As a moralist St Paul laid down, with incomparable clearness, the relations of ethics to the gospel, and the secret of the loftiest moral standard as rendered possible by the new life. No moralist before him had more distinctly illustrated the eternal principles taught by Christ, by showing their bearing on the simplest concrete duties of life. To take but one example—no moralist ever dealt with the duty of purity, so universally

ignored in the ancient civilisations, with such unrivalled delicacy yet with such absolute precision. By insisting on the new truth, 'Know ye not that your bodies are the temples of the Holy Ghost, who dwelleth in you?' he placed chastity on a wholly new basis, and contributed indefinite force and meaning to Christ's elucidation of the duties implied in the seventh commandment as extending even to the thoughts of the heart.

(3) As a reformer St Paul not only relieved the world from that yoke of petty Levitic observances which even St Peter pronounced to have been intolerable, but he emancipated all true religion from the burden of external Pharisaic restrictions, from all oral laws and traditions of the elders, and ecclesiastical tyrannies of ceremonialism, and all terror of humanly-invented sins. He was the divinely-appointed champion of the principle 'Ye shall know the truth, and the truth shall make you free.' This is the keynote of one of his most important epistles—that to the Galatians—in which he alludes no less than eleven times to the privilege and duty of 'standing fast in the liberty wherewith Christ hath made us free' (Gal. ii. 4; iii. 28; iv. 22, 23, 26, 30, 31; v. 1, 13). Hence this epistle powerfully swayed Wyclif, Huss, Savonarola, Luther, Tyndale, Wesley, and all great religious reformers. The truths which Luther learned from it became in his hands the instrument for the deliverance of the church from the tyranny of Rome. 'The Epistle to the Galatians,' he said, 'is my epistle. I have betrothed myself to it. It is my wife.' Bengel calls this epistle 'the sum and marrow of Christianity,' and says of v. 1-6 'in these stands all Christianity.'

(4) In the Epistle to the Galatians we also find the germ of that great doctrinal system which makes St Paul the chief founder of Christian theology. In the doctrinal section of the epistle (iii. 1-iv. 30) he had proved the doctrine of our justification by faith. He had shown that justification is not attainable by outward ordinances. His proofs had been drawn from the Christian consciousness (iii. 1-5), from the Old Testament (iii. 6-18), and by establishing the secondary position of the law both objectively (iii. 19-29) and subjectively (iv. 1-18). In the Epistle to the Romans, which was probably a circular treatise, sent round with different appendices of personal greetings to various churches, the theme of justification is more systematically worked out. The keynote of that epistle is the recurrent word *all*, as illustrative of the spiritual universality of the gospel to meet the universality of man's need for the gospel. In this epistle the four main positions are (1) all are guilty before God; (2) all need a saviour; (3) Christ died for all; (4) we are all one body in Him. In Adam all are equally guilty (i. 18-iii. 20), in Christ all are equally redeemed (iii. 21-30). The grand fundamental theme of the epistle is given in Rom. i. 16, 17. It is stated not as a *doctrine* of sin, or a *theory* of imputations, or a theological shibboleth, but as a momentous practical truth. The elements of that great summary are (1) justification; the righteousness of God imputed to man; (2) faith; man's belief, rising first to self-surrender, then to mystic union with Christ, which becomes the germ of a new life in the heart; (3) this plan of salvation by free grace is offered gratuitously to all; (4) the object of this faith is Jesus Christ, whose life and death are for man a ransom and a propitiation; (5) Christ's sacrifice was necessary as a vindication of God's righteousness in the pre-emption of past sins; (6) the end to be obtained was that God might justify every man whose root of life is faith in Christ.

St Paul dwelt therefore on three cardinal points—the Grace of God, the Redemption of Christ,

the Faith of Man. Luther rediscovered this truth theoretically by reading the epistles to the Romans and Galatians in the library of his monastery at Erfurt, experimentally by the facts of his own religious life. Wesley learned it, partly from the Moravians, and partly from Luther's commentary on the Galatians, after his return from Georgia. But this cardinal doctrine of justification by faith is ignorantly misunderstood and perilously misinterpreted when faith is confused with mere belief. Hooker (*Eccles. Pol.* I. xi. 6) long ago corrected this error; and of recent critics, both Baur (*Paul*, ii. 149) and Pfeiderer (*Paulinismus*, sect. 5) have given the true meaning of St Paul. Baur shows how faith, beginning in hearing, and becoming faith in Christ (Gal. ii. 16, iii. 26), and more especially in Christ's blood (i.e. the communication to man of His essential life, Rom. iii. 24-27), becomes more intense as it narrows from stage to stage, and passes from theoretic consent to dominant conviction. Pfeiderer shows that there are ascending degrees and qualities of faith, passing from *dead* faith, which produces no works, and theoretic persuasion, first into faithfulness and moral surrender, and then into *mystic union with Christ*, which does not remain receptive, but becomes the spirit of life—a living power and impulse (1 Cor. vi. 17), so that, in its true sense, as Luther says, 'Faith is a divine work in us, which changes us and creates us anew in God.' The modern sense of faith as a body of doctrines (*the faith*) may, in this connection, be left out of sight altogether, since the word is only thus used in the Pastoral Epistles.

(5) But complete as is St Paul's statement of this central doctrine, which he characterised as *his* gospel (Rom. ii. 16, xvi. 25; Gal. i. 7, ii. 2; 2 Tim. ii. 8)—complete, that is, so far as we can give such a title to truths which touch, on every side, upon insoluble mysteries—we are thankful that the same essential truths are represented in a less controversial and more directly spiritual form in the epistles of the captivity—those especially to the Ephesians and Colossians. The mind of St Paul—as we see at once when we read his epistles in chronological order—was not only intensely susceptible to surrounding conditions of life and controversy, but was also one which was constantly in a state of growth and progress. The theodicy which he had been led to formulate in the 'storm and stress' of Judaic controversy assumed larger, richer, less rigid and antagonistic forms when he had to wean the infant church from the dangerous glamour of incipient Gnostic heresies. Olshausen calls the epistles to the Romans and Galatians soteriological—i.e. they contain, so to speak, the philosophy of the plan of salvation; and the epistles to the Colossians and Ephesians Christological—i.e. they insist on the immediate relation of the soul and of the church to Christ. The epistles are closely connected, though that to the Colossians is less exquisite and gracious than that to the Ephesians, which may well be called the Epistle of the Ascension, the Epistle of 'the heavenlies.' The idea of the Epistle to the Colossians is 'Christ all in all,' and its moral is summed up in the words 'Walk in Him, in Him alone.' The idea of the Epistle to the Ephesians is Christ in the universal church. In the Epistle to the Romans the doctrine of salvation is set forth psychologically. It is built on the moral facts of the universality of sin, the insufficiency of man, the justification of the believer by union with Christ. In the later epistles the statement of the doctrine is theologic. Christ is set forth as the central being of the universe, and we see God's eternal plans realised by the unity of redeemed humanity in Christ with the family of heaven in the heavenlies.

Round these central truths all the other views of St Paul are crystallised. The fierce disputes in which rival dogmatists—St Augustine and Pelagius, the Jesuits and Jansenists, the Calvinists and Arminians, and many others—have combated over his opinions arise from the futile attempt to systematise exorbitant inferences drawn from isolated phrases, to build upon their apexes inverted pyramids of argument, to obscure the whole heaven of Christianity with smoke made to issue 'from the narrow aperture of single texts.' Such attempts must always fail. St Paul's letters were *écrits de circonstance*. They were casual; they were fragmentary; they were the outcome of the special conditions with which they immediately dealt. St Paul 'never recoils before a paradox;' he never cares to remove an apparent contradiction; he knew that truths which apparently contradict others are often complementary truths; he leaves side by side the apparent antinomies which arise from the contact of finite reason with infinite truth. He was well aware that when reason steps beyond the limits of experience it comes into collision with mysteries not only insoluble, but apparently opposite to each other. Since *omnia exeunt in mysterium*, he was not concerned to reconcile the opposite facts of predestination and free-will; of universal restoration and a twofold end of probation, of the necessity for human effort and yet its ineffectualness. He knew that such antinomies involve no perplexity in the region of practical life. While he created the language of Christian theology, and often enshrines a whole world of thought in a single word, he lends no sanction to the theological controversialists who, with mutual bitterness, have persisted in rending Christendom asunder by pursuing the great saving truths of religion into speculative extremes.

The literature bearing on St Paul is vast in extent; the following are merely the names of the more important modern books: (1) LIFE.—K. Schrader, *Der Apostel Paulus* (1830-36); Neander, *Gesch. der Pflanzung u. Leitung der Christl. Kirche durch die Apostel* (vol. i. 1832; Eng. trans. 1851); F. C. Baur, *Paulus der Apostel Jesu Christi* (1845; 2d ed. by Zeller, 1866; Eng. trans. 1873-75); A. Hausath, *Der Apostel Paulus* (1865; 2d ed. 1872); Ch. F. Trip, *Paulus nach der Apostelgeschichte* (1866); Renan, *Les Apôtres* (1866) and *Saint Paul* (1869); F. Bungener, *S. Paul, sa Vie, son Œuvre, ses Épîtres* (1867); M. Krenkel, *Paulus, der Apostel der Heiden* (1869); W. J. Conybeare and J. S. Howson, *The Life and Epistles of St Paul* (1852); F. W. Farrar, *The Life and Work of St Paul* (1879); Lewin, *The Life and Epistles of St Paul* (1851; new ed. 1874); and good shorter studies by O. H. Taylor (1884), J. Stalker (1884), and Professor Iverach (1891).

(2) THEOLOGY.—Ritschl, *Die Entstehung der Altkatholischen Kirche* (2d ed. 1857); A. Sabatier, *L'Apôtre Paul* (1870; 2d ed. 1881); K. Holsten, *Zum Evangelium des Paulus u. Petrus* (1868), and *Das Evangelium des Paulus dargestellt* (1880 et seq.); R. Schmidt, *Die Paulinische Christologie* (1870); O. Pfeleiderer, *Der Paulinismus* (1873; 2d ed. 1890; Eng. trans. 1877), and *Hibbert Lectures* (1885); Ernesti, *Die Ethik des Apostels Paulus* (1868; 3d ed. 1880); J. H. Scholten, *Das Paulinische Evangelium* (1881); E. Menegoz, *Le Péché et la Rédemption d'après St Paul* (1882); H. Gunkel, *Die Wirkungen des Heil. Geistes nach der popul. Anschauung der Apostol. Zeit. u. nach der Lehre des Apost. Paulus* (1888); and Ch. Rogge, *Die Anschauung des Apostels Paulus von die relig.-sittl. Char. des Heidenthums* (1888); also the general works on the theology of the New Testament by Chr. F. Schmid (edited by Weizsäcker, 1853), Baur (1864), B. Weiss (1868; Eng. trans. 1868-69), and J. J. van Oosterzee (1869; 2d ed. 1886).

See also the relevant parts of the *Introductions* of Bleek, Weiss, S. Davidson, Salmon, Holtzmann, &c.; and especially the works devoted to the *Acts* by Overbeck (1870, in De Wette), Zeller (1854; Eng. trans. 1875-76), H. Wendt (1888, in Meyer), and K. Schmidt (vol. i. 1882); also C. Weizsäcker, *Das Apostol. Zeit-*

alter der Christl. Kirche (1886). See also the countless Commentaries on the individual epistles of St Paul, the names of which will be found under the special articles thereon. Of these may here merely be mentioned, as masterpieces in their kind, those of Godet on *Romans* and *Corinthians*, and Lightfoot on *Philippians*, *Galatians*, *Colossians*, and *Philemon*.

Specially noteworthy articles on St Paul are those by Haurath in Schenkel's *Bibel-Lexicon*; Beyschlag in Riehm's *Handwörterb. des bibl. Alterthums*; Lange in the first edition of Herzog's *Real-Encyclopädie*, W. Schmidt in the second edition; and Hatch in the *Encyclopædia Britannica* (9th ed.). The so-called Tübingen theory of the fundamental distinction between the Pauline and Petrine parties in the early church is maintained in the books by Baur (q.v.), Holsten, Zeller, and Scholten, already mentioned. See the article CHRISTIANITY in the present work.

Paul was the name of five popes. PAUL I. (757-767) and PAUL II. (1464-71) were unimportant. PAUL III., Alessandro Farnese, reigned from 1534 to 1549, during a very critical period for the papacy. He was born at Carino in Tuscany in 1468, and was created cardinal-deacon in 1493 by Alexander VI., who had illicit relations with his sister. He showed great powers of diplomacy, and on the death of Clement VII. in 1534 was elected pope. One of his first acts was to give cardinals' hats to two of his boy-grandsons, and throughout his reign he laboured to advance his sons; but his ambitious schemes to secure Parma and Piacenza to the debauched Pietro Luigi were at length frustrated. Yet in other respects he was a wise pontiff, and he had the prudence to surround his throne with good cardinals like Contarini, Pole, and Sadolet. He convoked a general council to meet at Mantua in 1542, but it did not actually assemble (in Trent) until 1545. The bull of excommunication and deposition which he issued in 1538 against Henry VIII. of England is a late example of the exercise of the temporal power claimed by the mediæval popes. The bull instituting the order of the Jesuits (1540) is important as marking the beginning of the Roman counter-reformation. In the contest of Charles V. with the Protestant League in Germany Paul sent a large force to support the emperor, and he opposed the pacification proposed by him upon the basis of the Interim. And in the struggle between the emperor and Francis I. he tried to trim in order to save the peace of Italy and the interests of his bastards. He died suddenly, November 10, 1549.

PAUL IV., named Giovanni Pietro Caraffa, a member of the noble family of that name, was born in Naples in 1476. His early career was distinguished for ascetic rigour. He was appointed Bishop of Chieti, in which see he laboured most earnestly for the reformation of abuses, and for the revival of religion and morality. With this view he established, in conjunction with several congenial reformers, the congregation of secular clergy called Theatines, and was himself the first superior. He showed himself the most rigorous enemy of heresy, and it was under his influence that Paul III. organised the tribunal of the Inquisition in Rome. On the death of Marcellus II. in 1555, although in his seventy-ninth year, he was elected to succeed. He enforced vigorously upon the clergy the observance of all the clerical duties, and enacted laws for the maintenance of public morality. He established a censorship, was the first to issue a full official *Index librorum prohibitorum*, and completed the organisation of the Roman Inquisition; he took measures for the alleviation of the burdens of the poorer classes, and for the better administration of justice, not sparing even his own nephews, whom he banished from Rome on account of their corrupt conduct and profligate life. His foreign relations, too, involved him in much labour and perplexity.

He was embroiled with the Emperor Ferdinand, with Philip II. of Spain, with Cosmo, grand-duke of Tuscany. Under the weight of so many cares his strength gave way, and he died, August 18, 1559. His severity had been hateful to the Roman citizens, who hailed the news of his death with delight.

PAUL V., originally named Camillo Borghese, was born in Rome in 1552. In his early life he was a distinguished canonist and theologian; and, after the ordinary prelatical career at Rome, he rose first to the post of nuncio at the Spanish court, and afterwards to the cardinalate under Clement VIII. On the death of Leo XI. in 1605 Cardinal Borghese was elected to succeed him. His pontificate is rendered memorable by the celebrated conflict with the republic of Venice, into which he was plunged at the very outset of his reign. The original ground of dispute was the question of the immunity from the jurisdiction of civil tribunals conceded to the clergy, who claimed to be tried by ecclesiastical tribunals alone. This claim the senate resisted; and further causes of dispute were added by a mortmain law, and a law prohibiting the establishment of new religious orders or associations unless with the sanction of the senate. Each party remaining inflexible in its determination, Paul issued a brief, directing a sentence of excommunication against the doge and senate, and placing the republic under an interdict, unless submission should be made within twenty-four days. The senate persisted, and an animated conflict, as well of acts as of writings, ensued, in the latter of which the celebrated Fra Paolo Sarpi, on the side of the republic, and on the papal side Bellarmine and Baronius were the leaders. By the intervention of Henry IV. of France the dispute was accommodated in 1607, but not until the pope had been compelled to abandon his claims. Paul's administration was vigorous on behalf of orthodoxy, and he did a great deal for the promotion of useful public works, for the embellishment of the city, the restoration and preservation of antiquities, the improvement of the museums and libraries, and, above all, for the pious and charitable institutions of Rome. Paul died January 28, 1621, and was succeeded by Gregory XV. See T. A. Trollope's *Paul the Pope*, and *Paul the Friar* (1860).

Paul, emperor of Russia, the second son of the unfortunate Peter III. and the Empress Catharine II., was born October 2, 1754, became heir-apparent on the death of his elder brother in 1763, and succeeded his mother on the imperial throne in 1796. The tragical death of his father when he was still a child, and his mother's neglect, exerted a baneful influence on the character of Paul, who was kept in seclusion while Catharine and her favourites governed. His earliest measures were the exile of his father's murderers, and the pardon of Polish prisoners, including Kosciusko. But he soon revealed his capricious and violent temper, as well as his lack of capacity, and irritated all classes of his subjects by vexatious and imperious regulations. Not less unhappy and variable was his foreign policy. After beginning with an attitude of neutrality in the war between France and the rest of Europe, he suddenly declared in favour of the allied powers, and sent an army of 56,000 men under Suvaroff into Italy. Encouraged by his success, he despatched a second army of equal strength to co-operate with the Austrians, but its defeat in 1799 induced him to recall Suvaroff; whereupon he retired from the allied coalition without giving any reason, quarrelled with England, and entered into a close alliance with the First Consul Bonaparte. Paul now concluded a convention with Sweden and Denmark for the purpose of opposing the right insisted on by England of

searching neutral vessels, with the result that the English government sent a fleet into the Baltic under Nelson to dissolve the coalition, at the close of March 1801. He was about to help the Danes, when a conspiracy was formed against him at St Petersburg. Among the conspirators were Count Pahlen, General Bennigsen, and other distinguished officers, and their aim was originally only to compel Paul to abdicate; but a scuffle arose in which the emperor was strangled, March 24, 1801.

Paul, CANONS OF ST. See BARNABITES.

Paul OF SAMOSATA, the Socinus of the 3d century, was born at Samosata on the Euphrates, capital of a district of Syria, and in 260 became bishop or patriarch of Antioch, the most important see of the East. Antioch then belonged to the Palmyrene kingdom, and Paul was practically the vicegerent of Queen Zenobia, from whom he received support in the maintenance of his heresy. This was monarchianism—the doctrine that Father, Son, and Holy Ghost are the one God, and that the Father has from all eternity produced the Logos, who is his Son, but is rather an attribute than a person. Antioch being recaptured by Aurelian in 272, Paul's enemies procured his deposition by the heathen emperor; but his doctrines survived, and he had followers, Paulianists or Samosatenians, till the 4th century.

Paul, VINCENT DE. See VINCENT DE PAUL.

Paula. See FRANCESCO DI PAULA.

Paulding, JAMES KIRKE, an American author, was born in Dutchess county, New York, August 22, 1779. Self-educated, he early showed a tendency to literature, and, being a friend of Washington Irving, wrote a portion of *Salmagundi*. During the war of 1812 he published the *Diverting History of John Bull and Brother Jonathan*; and in 1814 a more serious work, *The United States and England*, a defence against articles in the *Quarterly Review*. This gained him an appointment on the Board of Naval Commissioners. He still continued to write minor satires and humorous sketches, and in 1831 published the very successful novel, *The Dutchman's Fireside*, and in 1832 *Westward Ho!* which attained to a similar popularity. These were followed by a popularly written *Life of Washington* (1835), and *Slavery in the United States* (1836), in which the institution is defended on social, economical, and physiological grounds. In 1837 Van Buren appointed him Secretary of the Navy. Four years later he retired to a country residence at Hyde Park, New York state, where he died, April 6, 1860. The well-known patter lines, 'Peter Piper picked a peck of pickled peppers,' &c., occur in his satirical novel *Königsmarke* (1823). Four vols. of his *Select Works* were edited by his son (New York, 1867-68).

Pauli, REINHOLD, a no less learned than genial historian of England, was born in Berlin, 25th May 1823, studied at Bonn, next paid a long visit for purposes of study to England and Scotland, spent the year 1848 at Oxford, and acted from 1849 till 1852 as private secretary to Bunsen. In 1855 he returned to Germany and *habilitated* at Bonn, whence he was called to a chair at Rostock in 1857. He obeyed a call to Tübingen in 1859, but during the war of 1866 he was punished by being sent to the little *seminar* at Schönhofen for an article on the policy of Württemberg in the *Preussische Jahrbücher*. But he soon left this place, and was appointed to a chair at Marburg in 1867, at Göttingen in 1870. He died at Bremen, 3d June 1882. Pauli's life-long studies were devoted to English history, and the value of his work had long been known to students before it was recognised by the D.C.L. degree conferred by Oxford in 1874. His excellent book on Alfred (1851; Eng. trans. 1852)

induced Lappenberg to commit to him the task of continuing the *Geschichte von England* in the great series of Heeren and Uckert. Pauli's part (vols. 3-5, Gotha, 1853-58) begins with Henry II., and comes down to the accession of Henry VIII., and, while portions of its ground have been more fully treated since, remains still the best history of mediæval England. Other works are *Bilder aus Alt-England* (1860; Eng. trans. 1861), *Geschichte Englands seit den Friedensschlüssen von 1814 und 1815* (3 vols. 1864-75), *Simon von Montfort* (1867; Eng. trans. 1876), *Aufsätze zur englischen Geschichte* (1869; new series, 1883), besides an admirable edition of Gower's *Confessio Amantis* (3 vols. 1856).

Paulicians, a dualistic Eastern sect, who owe their name to their peculiar reverence for the apostle Paul and his writings. Their founder was Constantine of Mananalis, near Samosata, who felt it his mission to revive what he conceived to be the pure Christianity of St Paul, adopted the name Silvanus, and founded his first congregation at Cibossa in Armenia about 660. He was put to death by the emperor's order in 687, his successor, Titus, in 690; whereupon the adherents of the sect fled to Episparis under the Armenian Paul as leader. Later heads were Gegnesius, Baanes, Sergius, who carried them from the persecutions of Leo the Armenian to Argæum in Saracen Armenia, Karbeas, who built the cities of Amara and Tephrica for the remnant saved from the Empress Theodora's merciless severity, and Chrysocheres, with whose defeat and death by the soldiers of the Emperor Basil their power was finally broken. In 970 some of their remnants were transferred by the Emperor John Tzimisce to Philippopolis in Thrace; a century later great efforts were made for the conversion of these, and the new city of Alexiopolis built opposite for the converts. The sect, called *Popelicans* by Villehardouin, continued to exist in Thrace into the 13th century. And it has been affirmed that remnants survived at Philippopolis and in Bulgaria into the 19th century. The Cathari (q.v.) and Bogomili (q.v.) were similar or related sects.

The system of doctrine of the Paulicians was dualistic, the Evil Spirit being regarded as the author and ruler of the visible universe, the Good Spirit of the future world. The only Scriptures which they accepted were the four Gospels, fourteen Epistles of Paul, the three Epistles of John, James, Jude, and an Epistle to the Laodiceans. They rejected the title of *Theotokos*, refusing all worship to the Virgin, as well as any reverence to the symbol of the cross, and even the outward administration of the Lord's Supper and baptism. Photius, Petrus Siculus, and others identified them erroneously as a branch of the Manichæans, the fact being that they anathematized Manes, and only resembled his followers in maintaining a dualistic system. Gieseler and Neander trace them back to the Gnostic Marcionites.

See the Church Histories of Gieseler and Neander; F. Schmidt, *Hist. Paulic. Orientalium* (Copen. 1836); and Lombard, *Pauliciens, Bulgares, et Bons-hommes* (Geneva, 1879).

Paulinus, missionary to Northumbria, counted as the first of the archbishops of York. He was a native of Rome, and may have been named Rūm before his conversion. He was sent on his mission by Gregory in 601, and first laboured under Augustine in the evangelisation of Kent. By him he was consecrated bishop in 625, when he accompanied Ethelburga on her marriage to the still heathen Edwin, king of Northumbria. For a long time he made no progress in his mission beyond baptising the infant princess; but at length a great gathering was held at Goodmanham, near York, to consider

the matter, and in consequence Edwin and his court submitted to baptism at York, in a wooden chapel dedicated to St Peter, the foundation of the Minster, Easter Sunday 627. Paulinus now carried the gospel over Northumbria, but after six years' constant labour the death of Edwin in battle at Hatfield put a sudden end to his work. He did not wait for the honour of martyrdom, but went back with the widowed queen to Kent. In the same year he received the *pallium* as Archbishop of York from Rome, but he never returned, dying on October 10, 644. He was buried in the chapter-house at Rochester. See Dr Bright's *Chapters of Early English History*, and vol. i. of the *Lives of the Archbishops of York*.

Paulinia. See GUARANA.

Paulownia, a genus of trees belonging to the Scrophulariaceæ, with but one species, *P. imperialis*, a native of Japan, and now grown in the United States. It has heart-shaped leaves, and large panicles of purplish flowers. The name is derived from that of a Russian princess Paulovna.

Paul's, St. For the Cathedral, see LONDON; and for the school, see ST PAUL'S.

Paulus, ÆMILIUS. See ÆMILIUS, GREECE, SCIPIO AFRICANUS MINOR.

Paulus, HEINRICH EBERHARD GOTTLÖB, one of the pioneers of German rationalism, was born at Leonberg, near Stuttgart, 1st September 1761. His father's scepticism about the resurrection was cured effectually by a promised appearance of his wife after death, and not unnaturally was succeeded by an eager belief in spiritual visions which brought about his deposition from the office of *Diakonus*. The son studied at the Tübingen seminary, travelled in England, Holland, and France, and was called in 1789 to the chair of Oriental Languages at Jena, which he exchanged in 1793 for that of Theology. Here he produced his laborious but little read *Philologisch-kritischer und historischer Commentar über das Neue Testament* (4 vols. 1800-4); *Clavis über die Psalmen* (1791); *Clavis über den Jesaias* (1793). In 1803 he accepted the chair of Theology at Würzburg, next filled scholastic offices at Bamberg, Nuremberg, and Ansbach, and again in 1811 accepted a chair as professor of Church History at Heidelberg. Here he died, August 10, 1851. Of his numerous works the most important were his *Leben Jesu, als Grundlage einer reinen Geschichte des Urchristenthums* (2 vols. 1828), and *Exegetisches Handbuch über die drei ersten Evangelien* (3 vols. 1830-33). His chief critical principle is an assertion of the impossibility of the supernatural, and the miracles of Christ he therefore explained as due to a variety of mistaken opinions and errors in narration—a series of exegetical miracles postulated to get rid of the historical. Paulus lived long enough to see his own rationalistic theory of Scripture give place to the more scientific mythical theory of Strauss, and that in its turn shaken to its foundations on the one hand by the Tübingen school, on the other by Neander and his school.

See Paulus' *Skizzen aus meiner Bildungs- und Lebensgeschichte zum Andenken an mein 50-jähriges Jubiläum* (1839), and Reiholm-Meldeggs *Paulus u. s. Zeit* (1853).

Paulus Ægineta, a celebrated Greek physician, was born in the island of Ægina, and flourished most probably during the conquests of the calif Omar in the 7th century. Of his life we know almost nothing more than that he pursued his medical studies first at Alexandria, and afterwards in Greece and other countries. He had much knowledge and skill in surgery and obstetrics, and his *Synopsis of the Medical Art* has gone through many editions both in its original Greek and in Latin, English, and other translations.

Paulus Diaconus, the greatest of the Lombard historians, was born at Friuli about 720. He instructed Adelperga, daughter of King Desiderius, and most probably resided at the court of her husband, Arichis, Duke of Beneventum. He became a monk, probably of Monte Cassino, about 774, but seems later to have spent some years at the court of Charles. He died before the coronation of Charles as emperor, therefore not later than 800. Of his works the earliest is the *Historia Romana*, an epitome of events based on Eutropius, with additions compiled from Orosius, Jerome, and Jordanes. This work was again extended with interpolations by Landolf the Wise (c. 1000), and the whole compilation has been known as the *Historia Miscella*; there are editions by Eyssenhardt (1869) and Droysen in *Mon. Germ. Hist., Auct. Ant. ii.* The *Historia Langobardorum* comes down to the death of King Liutprand (744), and is largely compiled from Gregory of Tours, the *Origo Gentis Langobardorum*, the short history (*De Gestis Langobardorum*) by Albat Secundus of Trent (died 612), and other sources. His other works are a *Life of Gregory the Great*, compiled from Gregory's own writings and from Bede; *Gesta Episcoporum Mettensium*, written at the request of Bishop Angilram, containing an interesting account of the rise of the Carolingian house, the founder of which was Arnulf, Bishop of Metz (ed. in Pertz, S.S. ii.); an *Epitome*, or extracts from the *De Significatione Verborum* of Sextus Pompeius Festus (ed. by K. O. Müller); a *Book of Homilies*, consisting of 298 sermons selected from Ambrose, Augustine, Chrysostom, Gregory, Jerome, and Leo; *Poems*, in honour of St Benedict, in praise of the Lake of Como, &c. (ed. by Dümmler in the *Monumenta Germ. Historica, Poetarum Latinorum Medii Ævi*, i.); and *Letters*, to Adelperga, Adelhard, Charles, and others.

Pausanias, a famous Spartan regent and general, the son of Cleombrotus, and nephew of Leonidas. He commanded the confederate Greeks in the important battle of Plataea (479 B.C.), in which the Persians were totally routed, and their leader, Mardonius, slain. He then marched his troops against Thebes, and compelled the inhabitants to give up the chiefs of the Persian party to him for punishment. Elated by this victory, however, he became in an extreme degree haughty and vainglorious, took all the credit to himself, and allowed none to the Athenian generals, Aristides and Cimon, who commanded under him, and treated all the other Greeks as if the Spartans were their lords. Nevertheless, he still continued his conquests, capturing Cyprus and Byzantium. It was here he first began to play false to Greece. He entered into secret negotiations with Xerxes, with the view of becoming ruler, under the Persian monarch, of the whole country, and, in his journey through Thrace, even adopted the dress and luxurious habits of a Persian satrap, and surrounded himself with a body-guard of Persians and Egyptians. He was recalled, on account of these things, by the Spartans, but his former services procured his acquittal. He then returned to Byzantium, where he renewed his traitorous intrigues, was expelled from the city for a criminal assault upon a Byzantine lady, withdrew to the Troad, and there continued his treachery. He was a second time called to account by the Spartan ephors, but again escaped, though with greater difficulty. Yet his passion for the sovereignty of Greece, even though at the expense of the national liberties, once more drove him to play

the traitor. He tried to stir up the Helots, but was taken in his own net. A Helot betrayed him. When Pausanias found his position desperate he took sanctuary in a temple of Athena. Hereupon the people blocked up the gate of the temple with heaps of stones, and left him to die of hunger, his own mother depositing the first stone.

Pausanias, one of the most eminent of Greek geographers and historians, was probably a native of Lydia in Asia Minor, and flourished under Hadrian, Antoninus Pius, and Aurelius. He travelled through almost all Greece, Macedonia, and Italy, and also through part of Asia and Africa, and composed from his observations and researches an *Itinerary of Greece* (*Hellados Periegesis*) in ten books, describing the different parts of that country, and giving a particular account of the monuments of art and of the legends connected with them. His style is unpretentious and easy, although devoid of any special literary grace, but his *Itinerary* possesses the rare merit of being the work of an honest and accurate eye-witness. Pausanias was a man of marvellous industry, and is one of the earliest examples of the antiquary in the full modern sense of that word. Even in his treatment of works of art he is ever the antiquary rather than the critic, and his observations seldom rise out of the prosaic atmosphere proper to the catalogue. But he has the saving grace of accuracy, and his work, bare and meagre as it is, remains one of the most precious records of antiquity that we possess. He has not grasped the distinction between legend and history; or, more correctly, dominated by the instinct of the collector, he has recorded everything that he learned, historical fact and local legend alike. Hence his work is a mine of wealth to the student of mythology and folklore, no less than to the archæologist proper.

The best editions are those of Siebelis (5 vols. 1822-28) and of Schubart and Wals (3 vols. 1838-40)—the latter reprinted in Teubner's series (2 vols. 1862). There are English translations by A. R. Shilleto and J. G. Frazer. See also Kalkmann, *Pausanias der Perieget* (1886); and Margaret Verrall's *Mythology and Monuments of Ancient Athens* (1890).

Pavement, flat stones or 'flags,' seldom exceeding 4 inches in thickness, used for covering footpaths, courtyards, kitchens, &c. (see FLAG-STONES). The name is also given to the stone covering of the carriage-way of streets. The Romans paved both their streets and their highways with stones in a most substantial manner, but until the 12th century mediæval cities were almost all unpaved. At Pompeii the stone pavement of the narrow streets remains in the same state as it was before the city was destroyed, and shows the ruts made by the bigæ or carriages. It is formed of polygonal blocks of stone, like cyclopean masonry, the largest pieces being about 3 feet across the face. This kind of ancient Roman pavement, the remains of which are found at other places in Italy, is laid on a carefully prepared basis or foundation, sometimes composed of several layers of suitable materials.

Modern streets in Europe and elsewhere are still most largely paved with hard stones of various kinds, roughly dressed into oblong blocks, say 12 in. by 4 in. and 6 in. deep, and smaller sizes. These are generally laid on a foundation of sand or very fine gravel, sand being also used for filling up the joints. But the jointing is now sometimes done with pitch. Granite and some varieties of Basalt (q.v.) are extensively quarried for these paving-stones.

Wooden pavement consists of pieces of wood (in northern Europe usually that of *Pinus sylvestris*) about the size of paving-stones, laid end up on boards, with asphalt or concrete below them, and

with the joints of the wood blocks pitched. Vehicles make least noise on this kind of pavement, which, though expensive to maintain, if under heavy traffic, continues in favour. Asphalt pavement is also a good deal used both for foot and carriage ways. It is described under ASPHALT. Both this and wood pavement are apt to be slippery in wet, and the latter in frosty, weather.

For foot-pavement a Portland cement concrete has been much employed of late years. Small stones, such as granite, crushed into small chips like beans, or not much larger, are mixed with the cement, which is laid on a bed of broken whinstone or 'road-metal.' Pavement so made is cheaper than when flagstones are used, but longer experience of it is necessary before we can say that it is in the long run more economical. The frequent necessity for lifting pavement when laying down or repairing gas or water pipes is a great drawback to the keeping of it in good order.

Pavia, a city of Northern Italy, on the left bank of the Ticino, 2 miles above its confluence with the Po, and 21 miles by rail S. of Milan. A covered brick bridge (1353) connects the city with the suburb of Ticino, on the right bank of the river. Pavia is still in great part surrounded by walls, and has an imposing appearance; in former times it was called the 'city of a hundred towers.' Its oldest church is the Lombard basilica of San Michele, which, although the date of its foundation is uncertain, is mentioned as early as 661. The early 'kings of Italy' were crowned within its walls; in 1863 it was granted the title of 'royal basilica,' and was restored 1863-76. The cathedral, containing some good paintings, was commenced in 1488, but was never finished. It shelters the tomb of Boëtius (brought from St Peter's) and Roland's lance; and in a beautiful chapel attached to it are the ashes of St Augustine, in a Gothic sarcophagus ornamented with a great number of bas-reliefs and figures. The Certosa, which lies 5 miles north of the city, is described in a separate article. The castle of the Visconti (begun in 1360), a massive square arcaded structure, once contained valuable collections of MSS., armour, and curiosities, but they were carried away by the French in 1500. The university is said to have been founded by Charlemagne, and was a famous seat of learning during the middle ages; but it was not formally constituted a university until 1361. It is now attended by 1000 students (1800 about 1850), who are taught by sixty teachers. Attached to it are two colleges—Borromeo (1563) and Ghislieri (1569)—for poor students, and a library (1772) of 185,000 vols., anatomical and natural history museums, a botanic garden, a school of the fine arts, &c. There is neither much industry nor much trade. Pop. (1881) 29,836.

Pavia, the ancient *Ticinum* (afterwards *Papia*, whence the modern name), was founded by Gallic tribes, and was sacked by Attila (452) and by Odoacer (476); Theodoric selected it as his capital after 489. Later on the Lombards made it their capital, and then it became the chief city of the kingdom of Italy. Through jealousy of Milan it sided with the emperors (1056-1356); it was then conquered by the Visconti, and subsequently shared the fate of Milan. It was sacked by the French in 1500. Here in 1525 the French were defeated by the imperialists, and Francis I. (q.v.) taken prisoner; but in 1527, and again in the following year, the city was taken and laid waste by the French. It was stormed and pillaged by Napoleon in 1796, and came into the possession of Austria by the peace of 1814. Since 1859 it has been included within the kingdom of Italy. Lanfranc and Pope John XIV. were natives.—The province of Pavia (1312 sq. m.) has a pop. of (1889) 513,983.

Paving. See PAVEMENT.

Pavlograd, a town of South Russia, 45 miles by rail ENE. of Ekaterinoslav, on an affluent of the Dnieper, was founded in 1780 by Zaporogian Cossacks. Pop. 14,442.

Pavonidæ. See PEACOCK.

Pawnbroking. Pawn is a contract whereby the owner of a thing delivers it to a creditor as security for a debt contracted by himself or by a third party. This contract is of great antiquity, as may be seen on referring to the story of Judah and Tamar (Gen. xxxviii.) and the provisions of the Mosaic law (Exod. xxii.). In modern times the superior class of money-lenders have often advanced money on pledges of plate, &c.; this was the business carried on by the Lombard traders, from whom Lombard Street in London takes its name; and it is said that the three golden balls which figure over every pawnshop were taken from the armorial bearings of the Medici family. Property of considerable value is sometimes pawned with bankers and others; and an equitable Mortgage (q.v.) may be described as a kind of pawn. Among the poorer classes, clothes, tools, &c. are frequently pledged when money runs short; like other small money-lenders, the pawnbroker is regarded by his customers as an extortioner, though the profits of the trade are not particularly high. On the Continent efforts have been made to supersede the pawnshop by establishing what are called *Monts de Piété*. In England a quasi-charitable institution of the same kind was started in 1708, but it came to a disastrous end in 1731; another scheme, started during the bubble mania of 1824-25, was equally unfortunate. In Ireland there were, in 1841, as many as eight *Monts de Piété*, but they had all disappeared by 1853. On comparing the rules and charges of the *Mont de Piété* (q.v.) at Paris (the largest establishment of the kind in the world) with those of English pawnbrokers, it does not appear that there is any striking superiority in the French system. It is understood that the Paris establishment is superior to the London pawnshop in two points—it charges a lower rate of interest, and it gives greater facilities for recovering stolen goods. On the other hand, it is said that officialism, which must prevail where a large staff is employed, makes it more difficult for the poor to obtain advances.

The rules of English common law which apply to a contract of pawn are founded in part upon the Roman law. The pawnbroker acquires what is sometimes called a special property in the goods deposited; he has a right to retain them, and, if the debt be not paid within the stipulated time, he has a right to sell; if the sale produces more than the amount of the debt, he must account for the surplus. The pawner has a right to redeem at any time before sale; interest is not due unless there is an express or implied contract to pay. These rules are considerably modified by the Pawnbrokers Act, 1872, which applies to all persons who make a business of taking chattels in pawn, including the keeping of what in England are called dolly-shops, and what in Scotland used to be called 'wee brokers.' Every pawnbroker is required to take out a license; unless in business before 1872 he must obtain a certificate of fitness from a magistrate or a petty sessions court before taking out a license. Pawnbrokers are required to keep books in a prescribed form; their shops are made liable to be searched under a magistrate's warrant. A ticket must be given on receiving goods in pawn; the pawnbroker may charge one halfpenny per month on each 2s. advanced; and there is also a small charge for the ticket. These charges are high, or rather would be high if the

pawnbroker were in the same position as an ordinary money-lender; but it must be remembered that the risks of this business are considerable, and also that the borrower obtains a larger advance by reason of the high interest. Pledges are to be redeemable within twelve months and seven days; if a pledge over 10s. in value is sold for more than the loan and profit due, the pawnbroker must account for the surplus on demand. These rules apply to any loan not above £10; but in the case of a loan of more than £2 the rules of the act may be excluded by special contract. The act extends to Scotland. Special enactments have been made in regard to persons pawning or receiving in pawn property belonging to public authorities—e.g. soldiers' arms and uniforms. See Turner's *Contract of Pawn*, where the statutes relating to this subject are summarised.

The law of the United States is the English law, as altered by the legislation of each state; but the law of Louisiana, which is French in its origin, approximates more closely to the Roman, and is free from the peculiarities of the English system. In New York the rate is limited to 25 per cent. per annum on articles worth less than \$25, and to 7 per cent. on articles of higher value. The rate usually charged is, however, 3 per cent. per month, and there are generally further charges for storage and safe-keeping.

Pawnees, a tribe of American Indians (q.v.), who formerly resided in Nebraska, with branches extending into Kansas and Texas. They surrendered their lands south of the Platte by treaty in 1833; suffered much thereafter at the hands of their hereditary enemies, the Sioux; and in 1876 removed, only 2026 strong, to a reservation of 233,020 acres in Indian Territory. In 1887 they numbered only 918. See Grinnell's *Pawnee Hero Stories and Folk-tales* (New York, 1889).

Pawtucket, a city of Rhode Island, on the Pawtucket River, 4 miles by rail N. of Providence. A fall of nearly 50 feet on the river, and its proximity to the sea, caused it to be selected by Samuel Slater, in 1790, as the site of the first cotton-factory in the United States. It now contains numerous large mills, where cottons, woollens, haircloth, and thread are manufactured, besides great calico-printing works, and bleaching and dyeing establishments, &c. Pawtucket was settled about 1655, and became a city in 1886. Pop. (1870) 6619; (1880) 19,030; (1890) 27,633.

Pax. See KISS.

Paxo, one of the Ionian Islands, lies south-east of Corfu, has with the smaller island of Antipaxo (1 sq. m.) an area of 8½ sq. m. and a pop. of 5000, and produces wine, olives and olive-oil, almonds, oranges, lemons, &c. Capital, Gaion, the seat of a bishop.

Paxton, SIR JOSEPH, English architect and horticulturist, was born at Milton-Bryant, near Woburn, Bedfordshire, on 3d August 1803. He began life as a working-gardener in the service of the Duke of Devonshire, at Chiswick, and was thence transferred to Chatsworth; there he was put in charge of the gardens, and entirely remodelled them, and was made manager of the duke's Derbyshire estates. The experience he obtained in designing capacious glass conservatories at Chatsworth (q.v.) found wider scope in his proposal for a palace of glass and iron for the Great Exhibition (q.v.) of 1851. It was the first time these materials had been employed on so extensive a scale, and visitors found an inexhaustible theme of admiration in a fairy palace so novel, beautiful, and magnificent. His design obtained for him the honour of knighthood. He then designed the Crystal Palace at Sydenham (q.v.), and superintended its construc-

tion from the materials of the exhibition in Hyde Park. He also laid out the terraces, and planned the gardens, with their fountains, cascades, &c. Besides publishing a very popular *Cottage Calendar*, he edited the *Botanical Magazine*, *Paxton's Flower-Garden*, *Pocket Botanical Dictionary*, and other works. He died at Sydenham, 8th June 1865, having represented Coventry since 1854.

Paymaster-general, an officer of the British ministry, but not of the cabinet, who is charged with superintending the issue of all moneys voted by parliament, but has no control over the sums issued, paying merely on the order of the department concerned. He is always either a peer or a member of the House of Commons, and changes with the ministry. Sometimes the paymaster-general's post is unpaid, as in 1891. The paymaster-general is assisted by a treasury remembrancer, and deputy-paymaster for Ireland, and a staff of clerks.

Paymasters, in the British army, are either 'regimental' or 'district.' There is one of the former, either a combatant officer or an officer of the army pay department, to every regiment of cavalry (except the Life and Horse Guards) and battalion of infantry. He receives drafts each month on the accountant-general for the various payments which he has to make, and for the sums required by the captains, who then open accounts with some local bank, and draw upon them for cash to pay their men, &c. The amounts of the drafts are based upon monthly estimates, and all expenditure is accounted for in the 'pay-lists.' These are checked by the district paymaster (an officer of the army pay department), and audited at the War Office, any wrong payments being disallowed. District paymasters also make all authorised payments to persons in their districts not dealt with by the regimental paymasters. On active service and whenever local banks cannot be used, cash is carried in 'treasure chests,' which are in charge of the paymaster. The *Paymaster-sergeant* is clerk to the paymaster.

The naval paymaster is for a ship what the military paymaster is for a regiment; but in addition he has charge of the provisions, clothing, and miscellaneous stores, as well as of money. Paymasters (till 1844 called *pursers*) are commissioned officers, and rank, according to service, with lieutenants, commanders, and captains. The paymaster or accountant officer is responsible for all the accountant and victualling duties of the ship, and under the authority of the captain makes now all disbursements for the naval service, the captain being held responsible that all accounts are sent in by the paymaster regularly, and that the balance of cash is correct. Candidates are nominated by the First Lord of the Admiralty, and, if they successfully pass a limited competitive examination, join as assistant-clerks. They must not be less than fifteen or over seventeen years of age. After one year's service, and being seventeen years old on passing the necessary examination, they are rated clerks. After three years' service in this rank, and having passed an intermediate examination, and being twenty-one years of age, they can pass for promotion, and if successful they receive a commission as assistant-paymaster, ranking first with sub-lieutenants, and after five years' seniority with junior lieutenants. From this time on their promotion, except in very rare cases, goes by seniority to paymaster, staff-paymaster, fleet-paymaster, who ranks with a commander, and paymaster-in-chief. This latter rank, however, is only given on retirement. The pay of an assistant-clerk is 2s. 6d. a day, that of a clerk 4s., while an assistant-paymaster's ranges from 5s. to 11s. 6d. a day according to seniority, with an additional allowance

of 2s. 6d. a day when in sole charge of a ship. The pay of paymasters, staff and fleet, &c. rises according to length of service from 14s. to a maximum of £1. 13s. per diem. All secretaries to flag-officers and the secretaries' clerks are now taken from the paymasters and assistant-paymasters.

PAYN, JAMES, a prolific novelist, was born at Cheltenham in 1830, and educated at Eton, Woolwich Academy, and Trinity College, Cambridge. In 1855 he published a volume of poems, in 1858 succeeded Leitch Ritchie as editor of *Chambers's Journal*, and in 1882 Leslie Stephen as editor of the *Cornhill Magazine*. Of his hundred novels may merely be named here *Lost Sir Massingberd*, *A Woman's Vengeance*, *Carlyon's Year*, *Not Wooded but Won*, *By Proxy*, *Thicker than Water*, *The Talk of the Town*, and *The Heir of the Ages*. These stories maintain a fair average of merit, below which they seldom fall, but above which they never rise. A characteristic note is a somewhat thin vein of humour, which is seen again in *Some Private Views* and *Some Literary Recollections* (1886).

Payne, JOHN HOWARD, the author of *Home, Sweet Home*, was born in New York City on 9th June 1792, made his début as an actor there in February 1809, and in 1813 appeared in London. For thirty years he had a successful career as actor and author of plays, chiefly adaptations. The best known were *Brutus*, *Charles II.*, and *Clari*, which contains the celebrated song for which Payne's memory is cherished. Its music is supposed to have been adapted from a Sicilian air by Sir Henry Bishop. Payne was appointed American consul at Tunis in 1841, and died there, 10th April 1852. It is a singular fact that the man who wrote *Home, Sweet Home* had never a home during the last forty years of his life, and died in a foreign land. His remains were, however, taken to America, and buried at Washington in 1883. See his *Life and Poems*, edited by G. Harrison (Albany, 1875; new ed. 1885), and C. H. Brainard's *J. H. Payne* (1885).

Paysandú, the chief town of the Uruguayan department of that name (5115 sq. m.; 28,417 inhabitants in 1887), is built upon a hill gently sloping from the Uruguay River, 280 miles by rail NW. of Montevideo. It is a busy port, and contains large slaughter-houses, &c. Tinned meat, especially tongues, is exported. Pop. 13,000.

Paz, LA. See LA PAZ.

Pea (*Pisum*), a genus of plants of the natural order Leguminosæ, sub-order Papilionaceæ. Two species, supposed to be natives of the south of Europe and of the East, are very extensively cultivated for their seeds (peas), which are the best of all kinds of pulse—the Common Pea or Garden Pea (*P. sativum*) in gardens, and the Field Pea (*P. arvense*) in fields; both of them climbing annuals, with pinnate leaves, ovate leaflets, and branching tendrils in place of a terminal leaflet; the garden pea distinguished by having two or several flowers on each flower-stalk, the flowers either red or white, more generally white, and the seeds subglobular; the field pea having one flower on each flower-stalk, the flowers always red, and the seeds angular from crowding and compression in the pod. But it is not improbable that they are truly one species, of which the garden pea has, through cultivation, departed farthest from the original type. Peas have been cultivated in the East from time immemorial, although the ancient Greeks and Romans do not seem to have been acquainted with this kind of pulse. Its cultivation was apparently introduced into Europe very early in the middle ages; and it now extends from warm climates, as India, even to

very cold latitudes, the plant being of rapid growth and short life. The pea does not appear to have been cultivated in England even in the time of Elizabeth. According to Fuller, they were then brought from Holland, and were accounted 'fit dainties for ladies, they came so far and cost so dear.' The seeds of the garden pea are used for culinary purposes both in a green and in a ripe state, as are also the green succulent pods of some varieties, known as Sugar Peas or Wyker Peas, in which the membrane lining the inside of the pod—parchment-like in most kinds—is much attenuated. Field peas are used both for feeding cattle and for human food. For the latter purpose peas are often prepared by being deprived of the membrane which covers them, in a particular kind of mill; they are then sold as *Split Peas*, and are much in use for making *Pea Soup*. They are also ground into meal, which is used in various ways, chiefly for making a kind of pottage and unleavened bread. In the countries bordering on the Mediterranean peas are roasted in order to eating.

There are innumerable varieties of the garden pea, but very few of the field pea, those of the former being so much the products of horticultural art that they cannot be preserved without the utmost attention. Some of the kinds of garden peas have long stems, and require for their support stakes 6 or 8 feet in height; others are of humbler growth; and certain dwarf kinds, preferred as most convenient in many gardens, succeed very well without stakes. The largest kinds are sown in rows about 4 or 6 feet asunder. In Britain garden peas are sown at different times from January to the end of June in order to secure a supply of green peas during a considerable part of summer and autumn; and in the southern parts of the island they are also sown in the end of autumn, a very little protection being sufficient for them during the winter. In the United States early peas are sown either in November or in February or March. Certain small kinds of very rapid growth, known as *Early Peas*, formerly preferred for the first sowings, although less productive than many others, are now being supplanted in the estimation of gardeners by larger and superior flavoured sorts, which combine the desirable quality of extreme earliness with the size and tenderness of the *wrinkled marrow* kinds.

Chalky and other calcareous soils are particularly suitable for peas, if to be used green, and in other soils a good field-crop is seldom obtained unless the land has been well limed, or manured with gypsum. The free use of lime is found to be unfavourable to the quality of field peas which are intended for human food, as peas from soil so treated do not readily melt or 'fall' in boiling, and are therefore more indigestible.

Market-gardeners in good districts in England find the pea a most profitable crop. Surrey, Bedfordshire, and Essex are the principal counties whence the supply for the enormous demand for green peas for Covent Garden Market is chiefly drawn. Supplies also are received from France in May, but are inferior in quality to the English. Peas are cultivated to a considerable extent as a field-crop in Britain, but are best adapted to those districts in which the climate is least moist, the seeds being very apt to grow in the pods when moist weather prevails in autumn, by which the crop is injured or destroyed. The most productive kinds, being also in general the most bulky in straw, are very apt to lodge before the pods are filled in wet seasons, and particularly on rich land. The crop is, therefore, rather a precarious one.

The haulm or straw of peas is used for feeding cattle; and for its sake field peas are often reaped before they are quite ripe, great care being taken

in stacking the straw to provide for ventilation, so that it may not *heat*. Pea haulm, when cut and dried green, is more nitrogenous and more nutritious than hay.

Land to be sown with field peas should be very *clean*, and in particular free of couch-grass; otherwise the best management cannot prevent its becoming more foul whilst bearing the pea crop. The seed ought always to be sown in rows not less than 20 inches apart. Various means are employed for sowing peas; they are not unfrequently ploughed under the furrow; but the seed ought not to be buried more than 4 inches under the surface. In the harvesting of peas the sheaves are generally left loose till the haulm is somewhat dry. In drying it shrinks very much. *Winter Field Peas*, a variety with very small seeds, are much cultivated in France and Germany, being sown in October, enduring the severest frosts without injury, and ripening very early.

Besides being one of its most important agricultural and horticultural crops, peas are largely imported into Britain, the quantity sometimes reaching 120,000 quarters. The chief sources are Denmark, Germany, Holland, Morocco, the United States, British North America; and of these Denmark and the North American colonies send the greater part. As an article of food, if not taken too often or without other food, peas are very valuable, as they contain a large percentage of *casein*, which is a flesh-forming principle. This principle in the pea has been called *legumin*, but chemists are now generally agreed that it is identical with the casein of cheese. The chemical constituents of peas will be found in the table at DIET, Vol. III. p. 808; and the dietetic value is discussed at FOOD, Vol. IV. p. 719. Tinned peas are much used, but have little of the delightful flavour of this fresh vegetable.

A plant found on some parts of the shores of Britain, as well as of continental Europe and North America, and known as the Sea Pea, has been commonly referred to the genus *Pisum*, and called *P. maritimum*, although botanists now generally refer it to *Lathyrus*. It much resembles the common pea; has large reddish or purple flowers on many-flowered stalks; and its seeds have a disagreeable bitter taste. Its abundance on the sea-coast at Aldeburgh and Orford, in Suffolk, is said to have saved many persons from death by famine in 1555.—The other species of *Pisum* are few. But the name Pea is often given to species of other papilionaceous genera. The Sweet Pea (q.v.) and Everlasting Pea are species of *Lathyrus*. The Chick Pea (q.v.) is a species of *Cicer*; and the Wood or Heath Pea is *Orobis tuberosus*.—The pods of peas are often injured by the Pea-beetle (*Bruchus pisi*), a small coleopterous insect; by the Pea-maggot, the caterpillar of a moth (*Tortrix pisi*); and by the Pea-weevils (*Sitona crinita* and *S. lineata*), small coleopterous insects.

Peabody, a village and township of Massachusetts, 16 miles NNE. of Boston. Formerly called South Danvers, its name was changed in 1868 in honour of George Peabody, who was born here. The village contains the Peabody Institute, and the township has manufactures of carriages, leather, and glue. Pop. (1880) 9028; (1890) 10,158.

Peabody, GEORGE, American merchant and philanthropist, was born at South Danvers, Massachusetts, February 18, 1795. His parents, who were descended from the Paybods of St Albans, Hertfordshire, were poor, and his only education was received at the district school. At the age of eleven he was placed with a grocer, and at fifteen in a haberdasher's shop in Newburyport. He was manager of a store in Georgetown for a time; in

1814 he became a partner in the dry-goods house of Elisha Riggs in Baltimore, and head-partner of this firm in 1829. In 1827 he first visited England, where he afterwards settled permanently. He established himself in London in 1837 as a merchant and money-broker, and accumulated a large fortune. He invested largely in United States bonds during the civil war; and this, coupled with integrity, industry, and splendid capacity in finance, was the secret of his marvellous success. As one of three commissioners appointed in 1848 by the state of Maryland to obtain the restoration of its credit, he refused all payment, and received a special vote of thanks from the legislature of that state. In 1851 he supplied the sum required to fit up the American department at the Great Exhibition. That same year he started his 4th of July dinners, which were of some account in fostering good feeling between England and America. During his lifetime Peabody gave away in all more than one and a half millions sterling for philanthropic purposes.

Amongst his gifts were \$10,000 to the second Grinnell expedition, under Dr Kane; \$200,000 to the Peabody Institute, South Danvers (now Peabody); \$50,000 to an institute in North Danvers; \$1,000,000 to Peabody Institute, Baltimore; \$25,000 to Phillips Andover Academy, and \$25,000 to Kenyon College; \$150,000 to found an institute of archæology at Harvard, and a like sum for a department of physical science. His two largest gifts were \$3,500,000 for the Southern Education Fund, and his contributions towards building industrial homes in London, which in all amounted to £500,000. Recognition of his beneficence was made by the United States government, while the Queen offered him a baronetcy or the Grand Cross of the Bath. He refused these honours, and was asked what he would accept. His reply was: 'A letter from the Queen of England which I may carry across the Atlantic and deposit as a memorial of one of her most faithful sons.' The Queen's letter acknowledged his 'more than princely munificence'; to this she added her portrait, and both were deposited in the Peabody Institute, South Danvers. Peabody testified that his giving was really a triumph over a naturally parsimonious disposition; he lived and dressed plainly. 'The brave, honest, noble-hearted friend of mankind,' as the Hon. R. C. Winthrop called him, died in London, November 4, 1869. The residue of his fortune, amounting to upwards of £1,000,000 sterling, was left to his relatives. After a funeral service in Westminster Abbey his remains were conveyed to America in the English war-ship *Monarch*, and laid beside those of his mother at South Danvers. There are statues of Peabody in London and Baltimore. In 1889 the London Peabody trustees had eighteen groups of industrial buildings in various parts of the city, their rooms being occupied by 20,000 persons. The net gain from rents and interest was £30,000. See *Life* by P. A. Hanaford (1882), and Robert Cochrane's *Beneficent and Useful Lives* (1890).

Peace is a term of important significance in law. International law regards peace as the normal relation of one state to another; this relation is disturbed by war, but when war is over the combatants revert to their former rights, except in so far as these may have been altered by the war. In municipal law peace means the protection accorded to subjects of an established authority; thus, vassals were within the peace of their feudal lord. All subjects are within the peace of the sovereign, and judges and justices are appointed to keep the peace within their respective jurisdictions. A person who commits an assault, or otherwise wantonly invades the rights of another, is

guilty of a breach of the peace. If a law-abiding person is threatened with injury to himself, his wife or child, or his property, he may seek protection and 'exhibit articles of the peace' before a court or magistrate. Justices are empowered, on sworn information, to bind persons over to keep the peace; parties so bound and their sureties forfeit the amount of their recognisances if they offend. Under a statute of 34 Edward III. parties may be bound over to be of good behaviour. For conservators and justices of the peace, see JUSTICE OF THE PEACE.

The PEACE SOCIETY was founded in London in 1816, chiefly, but not exclusively, by members of the Society of Friends, and was a result of the deep feeling everywhere aroused by the long continental wars terminated by the peace of Paris in 1815. It was from the first a religious body, adopting as the basis of its operations the principle that 'war is inconsistent with the spirit of Christianity and the true interests of mankind.' It has always been unsectarian and international, and has endeavoured to secure the co-operation of Christian men and philanthropists in all countries. It advocates Arbitration (q.v.) as a substitute for war, the ultimate establishment of a code of international law and a court of nations, and the reduction, with a view to the final abolition, of standing armies. This society claims to be the centre of the peace movement, and among its triumphs may be mentioned the solemn recognition of the principle of arbitration in one of the protocols of the treaty of Paris in 1856, secured by a deputation to the plenipotentiaries of the Great Powers. But the most signal token of its influence and success is seen in the fact that since its commencement there have been sixty actual cases of successful arbitration, and a large number of instances in which an arbitration clause has been inserted in treaties. There are in America forty peace societies, and many in Italy, France, Sweden, Denmark, Holland, and Belgium. In England other great associations have been formed under the auspices of the Peace Society. The Workmen's Peace Association, founded in 1870 by members of the Reform League (now the International Arbitration League), is a large organisation of the working-men of London, which has now one hundred honorary agents in different towns. The International Arbitration and Peace Association for Great Britain and Ireland was founded in 1880, and a Universal Peace Congress was held in Paris in June 1889. This proved so successful that it was resolved that such a congress should be held annually in the different great cities of the world (London in 1890, Rome in 1891, &c.).

Peace River, a large river of Canada, rises in two branches in the Rocky Mountains, in British Columbia, and flows north-east to the outlet of Lake Athabasca, where it joins the Slave River by five widely separate mouths. The delta thus formed is, with that of the Athabasca River, the most fertile part of the country. The river has a length of about 1100 miles, but it is much encumbered with rapids. The Peace River was followed by Sir A. Mackenzie (1755-1820) in his expedition of 1792-93 (cf. his *Voyages*, 1801).

Peach (*Amygdalus Persica* of botanists, but now believed on later showing to be of Chinese origin) belongs to the order of Rosaceæ, and is of the drupaceous subdivision. This, the most delicious fruit that ripens in the open air of Britain, is nearly akin to the almond, resembling it closely in wood, leaves, and blossom, but differing widely in the character of the fruit. In the peach the stone is covered, not with a brittle husk, but a fleshy substance, juicy, melting, and of the finest flavour when matured and mellowed.

The peach-tree, like the almond, is of moderate stature, more or less spreading, according to variety, deciduous (though some are called ever-green), and, when left to itself, deep-rooted. The leaves (which contain some prussic acid) are lanceolate, on short footstalks, differ much in size, have their edges serrate or crenate, and have glands near the stalk, or are glandless. The serrate leaves, as a rule, are glandless; the crenate have glands, and the glands are either globular or reniform. Gardeners know it to be the case, but as yet know not the cause of it, that mildew (both of fruit and leaf) attacks the varieties with glandless leaves, while the glandulose have immunity. And for this reason *Royal George* (one of the finest of peaches, but having boldly serrate leaves without any glands) is seldom planted now against the open wall where mildew has paid one visit. The many varieties of the peach pass into divisions and subdivisions, according to the point regarded. There is first the decisive difference in the clothing, flesh, and flavour of the fruit, which has established the broad distinction between peach and nectarine. A very close observer is the man who can pronounce in winter, unless the trees happen to be his own, which of twain is nectarine, and which is peach. In summer there is a certain difference, perceptible, but not easily described, in the tint and cast of foliage; while the fruit on the other hand leaves no doubt, even from its first appearance, as to its proper title. Tales have been told on good authority as to the co-existence of the bald and the downy, the nectarine and peach, on the self-same twig, and even of a fruit which was peach on one side of the suture and nectarine on the other. To deny what is outside one's own experience, however large that experience may be, proves it capable of increase; but to doubt the adverse instance is permissible. The present writer has grown hundreds of thousands of peaches, and some myriads of nectarines, but has never seen either become the other, though they often grow amicably on the same branch *after budding*. Peaches and nectarines, while distinguished as above, pass alike into the other three divisions which have been established concerning them—to wit: (a) those which have large and those which have small blossoms; (b) those which have glandless leaves and those whose leaves are glandular; (c) those that have fruit which adheres to the stone and those whose fruit parts freely. Neither of these points affects the other two, and hence arise cross-divisions.

(a) As to size of bloom, it is hard to say why, but all known peaches and nectarines have blossom either very conspicuous or almost insignificant. Other fruit trees have blossom larger or middle-sized, or small, according to variety. Some gardeners fancy that the smaller bloom suffers less

Fig. 1.—Peach.

from the attacks of frost; the larger petals certainly show the nips more sadly, but the internal injury is received in either case. The colour of the blossom ranges from snowy-white to pink and rose (the latter being the most usual tint), and even to bright carmine.

(b) The leaves of the peach and nectarine, being as above described, furnish another classification according to the absence or presence of glands, and the form of glands when present. The gland is a small accretion or concretion upon the petiole, or at the base of the leaf itself; sometimes there is one gland at either edge, sometimes two, and at times even three. In form the glands vary from round to reniform; or even lenticular; but their function, if any, is not yet understood. Probably they take no active part, but are merely the tokens of a constitution adverse to fungoid overtures. However that may be, they afford one more division of the peach and nectarine, according as they are glandless or glandulose, the latter subdivided into those which have round and those which are gifted with long glands.

(c) Again, the peach and nectarine are palpably divided (according to the inner construction of the fruit) into *clingstones* (or *Pavies*) and *freestones*.

Fig. 2.—Fruit of the *clingstone* (a) and *freestone* (b) varieties, cut across to show the seed.

In the former the stone seems to radiate, as it were by tentacles, into the flesh, and the eatable part will not quit hold without great loss of the delicious juice. These peaches are therefore only fit to be sucked, for to quarter them fairly is impossible. And it is a sad indictment against the peaches of America that they belong mainly to the non-seccable section. But the freestones, chiefly grown in Europe, part from the stone with little rupture of tissue, and melt in the mouth instead of gushing on the plate. All the above being cross-divisions, the classes of the peach grow manifold; but the cultivation is the same with all. When grown on its own roots or on peach-stock the tree is short-lived, and being treated thus in America is worn out in some twenty-five years. In France it is worked upon the almond or the plum; in England the mussel-stock is the most approved; and upon this it attains the greatest age. But grow it as we may, it is impatient of the knife, and must receive its orders at a very early date. In the southern parts of England both nectarines and peaches ripen well upon the open wall, or even on dwarf standards in fine summers, and fruit so ripened is the best of all; but the summers of recent years have much discouraged our faith in nature, which is now becoming confidence in glass.

Though many good varieties have been added lately by the skill of nurserymen, the older kinds are not yet obsolete; and the chief gain, if any, is in the lengthening of the period when ripe peaches of some sort can be gathered out of doors. American kinds, such as *Alexander*, *Amaden's June*, and *Waterloo*, may ripen on the open wall in July; but like other prematurity are little worth. As yet we find nothing arisen newly to surpass our ancient friends *Noblesse*, *Galande*, *Grosse Mig-*

nonne, and the like, well known for many generations, and chiefly of French origin.

[In the United States peaches are grown profitably as far north as 40° N. lat. at least; enormous quantities are sent to the markets, and the fruit, in some form, is brought easily within the reach of all classes. The principal peach-growing states are Delaware, Maryland, Virginia, Pennsylvania, and New Jersey, in this order; but the fruit is also largely cultivated in Georgia, Florida, and Texas for the early market, from near the great lakes all down the Mississippi valley, and in California and Oregon. The canning of peaches is an important industry.]

For description of varieties, see André Leroy's *Dictionnaire de Pomologie*; R.H.S. *Catalogue of Fruits*, edited by Thompson; Dr Hogg's *Fruit Manual*; *The Orchardist*, by John Scott; *The Growth of Fruit under Glass*, by Thomson; and the treatises of the late Thomas Rivers.

Peachwood. See DYEING, Vol. IV. p. 138.

Peacock (*Pavo*), a genus allied to pheasants and other game-birds, including at least two species—the Indian and Singhalese *P. cristatus*, domesticated in Britain and other countries, and the Malayan *P. muticus*, inhabiting Java, Borneo, and similar regions. The Indian peafowls live in flocks, especially in mountainous and wooded districts, and are often accompanied by the tiger; though whether the tiger derives benefit from the wariness or flesh of the birds is uncertain. The birds roost in trees, and eat omnivorously—worms, insects, small snakes, seeds, &c. At the pairing season rival males display the well-known beauty of their tail-coverts before their desired mates, and strut about after the fashion of many game-birds. They sometimes fight fiercely with their rivals, and the females sometimes pay court to the males. Polygamy prevails, but there seems no truth in the old stories about the cruelty of the males to their mates. The usual cry is a shrill *Pao*, and strange noises are made by rattling the quills. The females lay, according to the climatic conditions, from April to October; the eggs, of a brownish colour, are numerous (eight to ten), and are laid without a nest in some concealed part of the jungle. At first both sexes are alike in plumage, but after a year or so the males gradually acquire their gorgeous feathers, which are perfected about the third year. It is not necessary to describe these colours, so delightfully familiar to all, but it may be noted that they are for the most part of a physical nature, being due not so much to pigment as to external markings, which produce iridescence. As to the evolution of the eye-like markings, which occur in varying degrees of perfection, we have on the one hand to recognise with Darwin that the more beautifully decorated males are selected by their mates, and on the other hand that we do not know to what precise conditions of feather-growth the marvellous beauty is due. The Javan peafowl is said to be even handsomer than the familiar species. Its 'crest, head, and neck are rich green, the breast bluish green margined with gold, the back bright copper-colour barred with green and light brown, and the upper tail-coverts rich green with gold and copper-colour reflections.' White or pied peacocks occasionally occur as sports, and yet more remarkable is the 'japanned' breed, which seems to have arisen quite abruptly.

The peacock seems to have been well known in Greece after Alexander's Indian expedition, but it was known in Judæa even in the time of Solomon. From Greece it spread to Rome and gradually westwards. In many different ways it has touched human life and fancy: it was the bird of Juno to the Greeks and Romans, and emblematic of a glori-

fied body to the early Christians; its feathers have adorned many a throne and shrine, and the perverted luxury of the later Roman empire made an entrée of the tongues or brains. The eggs and the young are edible, but domesticated peacocks are now kept almost solely for their beauty's sake, and that at some cost, for they are apt to do mischief both in garden and poultry-yard.

Peacock, THOMAS LOVE, satirist, was born at Weymouth on 18th October 1785, the only child of a London merchant, who died three years afterwards. His boyhood was passed at Chertsey, and for six and a half years he was sent to a private school on Englefield Green, but from thirteen he was self-educated, growing up an accomplished scholar. The chief events of his uneventful life were the loss of his first love (1808); his under-secretaryship to Sir Home Popham on a warship at Flushing (1808-9); his close friendship with Shelley, whom he first met in Wales in 1812, during one of his many walking tours; his employment from 1819 to 1856 in the office of the East India Company, as clerk, correspondent, and chief examiner; his marriage in 1820 to the 'Beauty of Carnarvonshire,' who bore him one son and three daughters, and died in 1852 after twenty-six years of ill-health; and the important part he bore in the introduction of iron steamships to Eastern waters (1832-40). In 1823 he had taken a cottage at Halliford on the Thames, and here he died, aged eighty, on 23d January 1866.

Peacock's literary activity extended over more than half a century. Of his half-dozen booklets of verse, published between 1804 and 1837, the best, *Rhododaphne*, offers nothing so good as some of the gay lyrics scattered throughout his seven 'novels'—*Headlong Hall* (1816), *Melincourt* (1817), *Nightmare Abbey* (1818; its hero is Shelley), *Maid Marian* (1822), *The Misfortunes of Elphin* (1829), *Crotchet Castle* (1831), and *Gryll Grange* (1860). And these 'novels' are interesting chiefly as a study of character—the author's own. A Rabelaisian pagan of the 18th century, egoistic, protean, such was Thomas Love Peacock, and in Thomas Love Peacock we have the Alpha and Omega of his writings. They mirror his likings (for nature, music, the classics, madeira, and good living generally), and his stronger, if exaggerated, dislikes (for field-sports, reviewers, political economy, all things Scotch and American, and, above all, Lord Brougham). They leave on one the impression that the little he did not know was to his mind not worth knowing, that because, for example, he had not been at a university and was not religious, therefore Oxbridge and heaven were beyond his microcosm. They may still find admirers in the cultured few, but the steely wit and erudition of their dialogues can never touch the great heart of the people. They are—trite though it sound—'caviare to the general.'

See Sir Henry Cole's collected edition of Peacock's works, with a preface by Lord Houghton and a memoir by his granddaughter (3 vols. 1875); also an article by Spedding in the *Edinburgh Review* for July 1875, and one by Mr Gosse in vol. iv. of Ward's *English Poets* (2d ed. 1883).

Peacock-stone, the name under which the dry cartilaginous ligaments of some large lamellibranchiate molluscs, as the pearl-oyster, have been sold by jewellers.

Pea-crab (*Pinnotheres*). See CRAB, COMMENSALISM.

Peak, the hilly district of north-west Derbyshire, having Castleton for its capital, 10 miles N.E. of Buxton. Measuring some 30 by 22 miles, it is watered by the Dove, Derwent, and Wye, and culminates in Kinder Scout (2082 feet), other emi-

nences being Axe Edge (1810 feet) and Mam Tor (1710). The Peak Cavern or Devil's Hole near Castleton penetrates 750 yards; and crowning a rock above the village is Peveril Castle, so named from its first lord, a bastard of William the Conqueror's. The wonders of the Peak were celebrated early by Thomas Hobbes (1666) and Charles Cotton (1683); recent works are by Croston (1862; new ed. 1889), Bradbury (1879), L. J. Jennings (1880), and Leyland (1891), besides others cited at DERBYSHIRE.

Pea-nut. See GROUND-NUT.

Pear. The pear (*Pyrus communis*), a member of the Pomaceæ, a sub-order of Rosaceæ, is a tree very largely cultivated for the sake of its fruit, which contests with that of the peach the first place in the list of the British Pomona, and vastly exceeds it in endurance. The pear is a native of Europe and the more temperate parts of Asia, and is still found wild in Britain, but in that state is of lesser girth and stature, with thorny branches and small harsh fruit, and jagged and sometimes pinnate leaves. Under cultivation the tree attains a height of 40 to 60 feet, with a trunk of a yard or even more in diameter, while the thorns disappear, though in some kinds they linger for years after grafting; the leaves are simple, ovate, serrate, or crenate, and sometimes almost entire, glabrous on the upper surface, sometimes tomentose on the under side while young; the flowers are in corymbs of five to eight or nine or even more, each bloom having five petals, generally white, though in some varieties touched or striped with pink, differing also in size and curve according to variety. The stamens are numerous, and the styles distinct, generally five in number and enclosed within the calyx-tube. With the growth of the fruit the ovaries become united, and form what is called the core, consisting usually of five cells, and each cell has one or two seeds or pips, which in many of the best kinds are imperfect. The fleshy mass which is formed around these constitutes what we call the fruit, differing greatly in form, size, and substance, according to variety, health, climate, and other influences. But the normal form of the pear, when we use the word as one of description, is cylindrical, long, and tapering from the stalk to the part just above the eye, where the diameter is greatest.

The pear-tree is grown upon divers stocks, as well as in many shapes and manners, by English gardeners. (1) As to stock—which partly governs other treatment—gardeners use either pear or quince, (a) the pear (which is called the free stock) being raised for that purpose from seed or otherwise, and grafted when strong enough, or budded, with the sort required. This is the way to obtain large trees, lusty and enduring, but loth to give fruit until they have found long experience. *Infecunda quidem, sed læta et fortia surgunt*. Whence the old distich—'The man who plants pears is a-planting for his heirs.' This has told much against the liberal stock, but in common with the race of proverbs is exaggerative. (b) The quince-stock, shallow-rooted, less vigorous in habit, and of briefer date. Upon this stock the pear, when congenial to it, begins to fruit even in the second year from working, gives larger, more beautiful, and sometimes better produce than it could afford upon its closer kindred, but does not grow to the bulk or stature which nature intended for it. It is a mistake, however, to suppose that the tree so wrought is cut short of life, unless of a nature that spurns the union, as some of the finest pears have always done. Other pears, indeed the great majority, thrive upon the quince for from ten to twenty years; and some kinds there are which show every sign as yet of a life as long and almost

as large as they could have attained without transmigration. (c) Other stocks whereupon the pear will grow are the hawthorn, the Sorbus, the *Cydonia japonica*, and several other members of the pyric race. Some kinds of pear will do well on some of these. But in spite of all local and paradoxical flourish, the stern fact remains that the success is fitful, comparatively brief, and scarcely worth the trouble.

(2) The shape and manner of growth are also manifold. In the northern parts of Great Britain and the bleaker portions of the south the pear—unless it be of an early kind—will not ripen well without the aid of glass or the shelter and warmth of a garden-wall. It is not largely grown under glass as yet, and for many good reasons, though very fine specimens are thus obtained. But as a wall-tree it is to be found in almost all fruit-gardens, and much of the finest fruit is thus produced. There are four modes of training now chiefly in vogue—viz. the old horizontal, the fan-shaped, the rectangular fork (with from two to twenty prongs), and the cordon, diagonal or horizontal, single, double, or treble, &c., and sometimes tortured into spirals. But, wherever the pear will ripen without the absorbed and reflected heat of a wall, the simplest and cheapest form of growth is that which our nurserymen call the dwarf pyramidal—more correctly termed the conical—or, with some few varieties which spurn that form, the less compact outline of the bush. Some diligence is needed at least twice a year to keep any of these in discipline.

(3) The varieties of pears are almost countless, as are those of apples, and nine-tenths are unworthy of the census. If this was so in the time of Virgil, we must not be surprised at the catalogue now. No year, however barren, lacks new kinds on paper, which are to supersede all previous issue. But the historical fact survives that pears were as well worth eating in the days of our ancestors as they are now, and that not more than some half-dozen of the hundreds introduced within the last forty years have earned their too obsequious welcome. And of this select band there are only three that deserve to be a joy for ever—*Doyenne du Comice* (perhaps the crown and the criterion); *Beurré superfin*, a noble satisfaction; and *Josephine de Malines*, an exquisite refinement. Also there is a grand pear of English origin, the *Pitmaston Duchess*, not of the finest quality, but good enough to be allowed to plead its beauty. To these the gardener will add, according to liking or locality, the best of the older kinds that have stood the test of generations, such as *Jargonelle*, *Williams' Bon Chrétien*, *Louise Bonne*, *Marie Louise*, *Knight's Monarch*, and *Fondante d'Automne*, and some ten or twelve others, preferring merit to magnitude, and bearing in mind the simple truth, though a stumbling-block to the million, that all fruit is better without wall or glass, when it can be so brought to perfection.

[In the United States the favourite variety is the *Bartlett*, which is exported in large quantities. The *Seckel* is a smaller fruit, but of a more delicate flavour. The states in which the pear is chiefly grown are California, Georgia, and Florida.]

See Hogg's *Fruit Manual*; *The Orchardist*, by John Scott; the Report of Pear Conference at Chiswick; and the *Pomological Dictionary* of André Leroy.

Pear, PRICKLY. See PRICKLY PEAR.

Pearl, a peculiar product of certain marine and fresh-water molluscs. Most shell-bearing molluscs are provided with a secretion with which they line their shells, and give to the otherwise harsh granular material of which the shell is formed a beautifully smooth surface, which prevents any

unpleasant friction upon the tender body of the animal. This secretion is laid in extremely thin semi-transparent films, which, in consequence of such an arrangement, have generally a beautiful iridescence (q.v.), and form in some species a sufficient thickness to be cut into useful and ornamental articles. The material itself in its hardened condition is called *nacre* by zoologists, and by dealers mother of pearl. Besides the pearl lining of the shells, detached and generally spherical or rounded portions of the nacre are often found on opening the shells, and there is great reason to suppose that these are the result of accidental causes, such as the intrusion of a grain of sand, or the frustule of one of those minute siliceous vegetables known as diatoms, or a minute parasite, or even one of the ova of the pearl-oyster itself, which, by irritating the tender body of the animal, obliges it in self-defence to cover the cause of offence, which it has no power to remove. Around this foreign body thin layers of nacre are deposited one after another, like the successive layers of an onion, until the object is completely encysted, and a pearl is formed. The pearl is formed of concentric layers of carbonate of lime of extreme tenuity, but of the same general character as those composing the shell.

The most famous pearls are those of the East; the ancients obtained theirs mainly from Ceylon (Taprobane) and the Persian Gulf, whence many of the best pearls still come. Other pearl-fisheries are in the Sulu Archipelago, off New Guinea, off some parts of the Australian coast, and amongst some of the Polynesian islands. In the Persian Gulf the most important pearl-yielding mollusc is the *Avicula (Meleagrina) fucata*. It is specially fished for pearls, and yields them in greatest number and of the finest kinds. It has a much smaller shell than the species which has been long known as the pearl-oyster, *Avicula (Meleagrina) margaritifera*. This last and another species (*A. macroptera*) are also extensively fished for in the gulf; but, though pearls are found in both, they are much more valuable for their shells than for the pearls they sometimes contain. Like the *A. margaritifera*, the *A. macroptera* has also a large shell. All three species are chiefly fished about the Island of Bahrein on the west side of the gulf. The centre of the trade is the port of Lingah, but all the pearls that come hence are called Bombay pearls. A steamer with a diver and diving-dress on board was sent out by an English firm of merchants in 1884 to try to obtain shells and pearls in the deeper water on the east side of the gulf, but the experiment did not succeed.

Of the Ceylon pearl-fishery, which, like the Indian ones on the Madras side of the Strait of Manaar, is under government supervision, and is only allowed at irregular intervals, some account is given at CEYLON, Vol. III. p. 78. The method of fishing may be thus described. The season of the fishery, when permitted, lasts from four to six weeks. For each diver there is provided a diving-stone, weighing about 40 lb., which is fastened to the end of a rope long enough to reach the bottom, and having a loop made for the man's foot. To each boat there is usually allotted a crew of thirteen men and ten divers, five of whom are descending whilst the others are resting. This work is done very rapidly; for, notwithstanding the stories of divers who can remain below for four minutes (see DIVING), the best divers cannot, as a rule, remain longer than eighty seconds below, and few are able to exceed sixty. The greatest depth they descend is thirteen fathoms, and the usual depth about nine fathoms. When the diver gives the signal by pulling the rope he is quickly hauled up with his net and its contents. Probably the

rarity of accidents from sharks, usually so abundant in tropical seas, is to be attributed to the bustle and to the excitement of the waters during the fishery frightening away those dreaded creatures. The divers are sometimes paid fixed wages, others agree for one-fourth of the produce. When a boat-load of oysters has been obtained it returns to shore, and the cargo, sometimes amounting to 20,000 or 30,000, is landed and piled on the shore to die and putrefy, in order that the pearls may be easily found. In Ceylon, in 1889, in twenty-two days fifty divers brought up 11 million oysters, which sold for 24s. per 1000 shells, the government receiving £10,000 and the divers £3200. When the animals in the shells are sufficiently decomposed the washing commences, and great care is taken to watch for the loose pearls, which are always by far the most valuable; the shells are then examined, and if any attached pearls are seen they are handed over to the clippers, who, with pinchers or hammer, skilfully remove them. Such pearls are only used for setting; whilst the loose ones, being usually quite round, are drilled and strung, and can be used for necklaces, &c.

The pearls vary much in size; those as large as a pea, and of good colour and form, are the best, except unusually large specimens, which rarely occur, the most extraordinary one known being the pearl in Mr Beresford Hope's collection at South Kensington, which measures two inches in length, and four in circumference, and weighs 1800 grains. The smaller ones are sorted into sizes, the very smallest being called seed-pearls. A considerable quantity of these last are sent to China, where they are said to be calcined and used in Chinese pharmacy. Amongst the Romans the pearl was a great favourite, and enormous prices were paid for fine ones. The single pearl which Cleopatra is said to have dissolved and swallowed was valued at £80,729; and one of the same value was cut into two pieces for earrings for the statue of Venus in the Pantheon at Rome.

The finest pearls are found within the mantle of the mollusc, close to the lips of the shell, or in the soft part of the oyster near the hinge of the shell; the worst pearls are those found within the close, coarse fibres of the adductor muscle. At intervals they are found loose in the shell outside the body of the oyster, and may when large get washed out of the shell and thus be lost. Lastly, pearls are often found embedded more or less deeply in the shell, having in some cases escaped from the soft tissues. It is notable that the adherent pearls occur almost invariably in the flat or lower valve; occasionally, it is true, they are found embedded in the rounded or upper valve, but in such cases it is observed that the shell has been found lying at the bottom in the reverse position. The pearls found embedded in or under the 'muscular impression' are always small, irregular, and worthless, similar to those found embedded in the adductor muscle itself. Pearls are found in infinite variety of form, and the consecutive layers vary in brightness, colour, and perfection. The most highly prized pearls are quite spherical, and it is evident from their shape that these must have been formed free in the mantle or in the soft tissues of the mollusc, and not cemented to the shell. Some pearls show defects caused apparently by the contact of new foreign substances, organic or inorganic, such as a grit or film of weed; and in some cases it requires a number of layers to completely hide these defects. Thus every new layer secreted changes the value of the pearl. When a pearl that has been cut from the shell presents a hemispherical surface, it is sometimes called a 'perle bouton'; such a pearl is flat on one side, and rounded or convex on the other. If a solid pearl has an irregular shape,

having grown over a rough object, it is known as a baroque pearl. Sometimes warty pearls are hollow, and pass under the name of 'coq de perle.'

Pearl-oysters frequently renovate their shells, and are in the habit of burying such intruders as they cannot otherwise dispose of. Stones, mud, small shells, wood, and especially layers of weed are found thus embedded in shells forming unnatural excrescences on the surface. These protuberances are gradually removed by the oyster secreting thinner layers of nacre on the top of them than on the base until the surface becomes again level. Slowly, but steadily, the exterior surface of the shell decays and disappears, until the foreign substance, of whatever nature it may be, comes within the reach of advancing dissolution, and thus the oyster literally passes a stone or other intruder through its shell. In the Natural History Museum, South Kensington, and in the Museum of Practical Geology in Jermyn Street there are specimens which clearly illustrate the processes of relining the shell and of burying foreign substances. They are flat shells (the lower valves), with a number of the figures of Buddha lying embedded at equal distances apart, on the upper portion of the shell near the lips, but not so deeply buried as to be hidden. These are produced artificially in China; the little figures are slipped carefully below the mantle of the oyster, and the process of deposition covers them with nacre.

The value of a pearl depends upon its size, shape, colour, brightness, and freedom from defects. The most valuable pearls at the present time are those which are perfectly round; the button-shaped ranks next, and then comes the drop or pear-shaped pearl. Perfectly round pearls over 25 grains in weight are extremely scarce, and secure high prices. They are greatly sought after to form the centre of necklaces, and large pearls of this character are safe and very profitable investments. The varying tints and colours of pearls are less difficult to understand than some of their eccentricities of growth. The changing condition of the sea, both as regards purity and temperature, the health of the oyster, accidents, such as the discharge of the inky fluid of the cuttle-fish in the neighbourhood of the oyster, all will probably affect the colours of the successive growth-periods of the pearl. Pearls, when of extraordinary beauty, size, and brilliancy, will sell for sums which appear extravagant.

The chemical composition of the pearl is carbonate of lime associated with a small proportion of organic matter. It is easily affected by acids and fetid gases, and may be calcined by exposure to heat. Its sp. gr. is 2.5 to 2.7. Three varieties of pearls being examined, British, Australian, and Singalese, the qualitative analyses showed that they all had an identical composition, and that they consisted solely of water, organic matter, and calcium carbonate. There was a total absence of magnesia, and of all the other mineral ingredients of sea-water, from which the inorganic part of pearls must of course be obtained.

The most important marine pearl-fishery on the American continent is that of Lower California, the central point being at La Paz. The largest and finest black pearls which come into the market are the specialty of these fisheries. In Australian waters pearls are fished on the coast of West Australia and of Queensland, and in Torres Strait.

River-pearls are produced by fresh-water mussels in Scotland, Wales, Ireland, various parts of Russia, Germany, Canada, and the United States. British pearls are spoken of by Tacitus and Pliny; and in the end of the 17th century the Scottish pearl-industry was of some importance. The Spey, Tay, South Esk, Doon, Dee, Don, Ythan, and Forth have

all yielded pearls; and a temporary revival of the industry took place in 1860 and succeeding years. In the United States the chief river-pearl fishery is in the Little Miami, in Ohio; but China is the great headquarters of the trade in river-pearls.

False pearls are made by blowing very thin beads or bulbs of glass, and pouring into them a mixture of liquid ammonia and the white matter from the scales of the bleak, and sometimes of the roach and dace. The scales of the lower part of the fish are very carefully washed and put to soak in water, when the pearly film falls off and forms a sediment at the bottom of the vessel, which is removed and placed in liquid ammonia for future use. This pearl mixture, when of the best quality, is very costly, being as much as £4 or £5 per ounce. For use it is diluted with ammonia, and injected into the glass beads, so as to thinly coat them inside; afterwards the better kinds have melted white wax or mucilage of gum-arabic poured in, which renders them much more durable. In this way are produced imitations of the finest oriental pearls, such as only the practised eye can detect. The art of giving the irregular forms of large pearls to the glass bulbs increases the resemblance; and the glassy appearance caused by the exterior glass coating is removed by exposing it for a short period to the action of the vapour of hydrofluoric acid. *Roman pearls* are lighter, as they have the coating of pearly matter on the outside.

See *Streeter's Pearls and Pearl-Life* (1886), and G. F. Kunz's *Gems and Precious Stones of North America* (New York, 1890).

MOTHER OF PEARL. The shells of several species of molluscous animals are popularly known as mother of pearl, those, for instance, of *Avicula macroptera* and of some species of *Haliotis*. To the shells, however, of *Avicula (Meleagrina) margaritifera* the term mother of pearl is properly applied. This species has a wide distribution in tropical seas. Macassar mother of pearl, from white-edged shells, is the most highly prized; the Manila yellow-edged shells are not much inferior; and the shells from some parts of Australia are also of a high quality, but those from Sydney and Auckland are of a gray texture. The poorest shells come from Panamá. By far the greatest supply of mother of pearl is now got from the north and north-west of Australia, but large quantities also are obtained from the Straits Settlements, the Persian Gulf, and the islands of the Pacific. The total annual value of what is imported into England is between £250,000 and £300,000, but much of this is sent to continental Europe.

The shell of the large pearl-oyster is thick, of slow growth, and sometimes measures nearly a foot across. Until the Australian fisheries were commenced about 1865 the supply of mother of pearl was diminishing, while the demand for it was and is constantly increasing. In France about 4000 and in Austria some 8000 persons are employed in working this substance for parts of fine furniture, inlaid-work, fans, buttons, &c. In England it is also largely made into buttons, cutlery handles, and ornaments for papier-mâché boxes, trays, &c.; in China and Japan lacquer-work has long been

decorated with mother of pearl. In Cashmere it is used for the inscriptions on gravestones; and fish-hooks are made of it in the South Sea Islands. For the beautiful play of its colours, see **IRIDESCENCE**.

Pearl Ashes. See **POTASH**.

Pearl Powder. See **BISMUTH**.

Pearson, JOHN, a learned English divine, was born 28th February 1612, in the same year as Jeremy Taylor, at Great Snoring, Norfolk, the son of the rector of that parish and Archdeacon of Suffolk. He was educated at Eton and at Queen's and King's Colleges, Cambridge, and became Fellow of the last in 1634. Five years later he took orders, and was collated to a prebend in Salisbury Cathedral. In 1640 he was appointed chaplain to the lord-keeper Finch, and soon after was presented to the rectory of Thorington in Suffolk. In 1650 he was appointed preacher at St Clement's, Eastcheap, London, and here in 1659 he published his admirably learned and judicial *Exposition of the Creed*. It was dedicated to his flock, to whom the substance of it had been preached some years before in a series of discourses, and it is still esteemed one of the very ablest works produced in the greatest age of English theology. During the same year (1659) Pearson edited the *Golden Remains of the Ever Memorable Mr John Hales of Eton*, with an admirable preface; and next he had a share in editing the *Critici Sacri* (1660). At the Restoration honours and emoluments were lavishly showered upon him. Before the close of 1660 he was presented by Juxon to the rectory of St Christopher's, in London; was created D.D. by Cambridge, and chaplain in ordinary to the king; installed prebendary of Ely and Archdeacon of Surrey; and made Master of Jesus College, Cambridge. In 1661 he was one of the most prominent commissioners, and the principal antagonist of Baxter, in the famous Savoy Conference; later in the year he received the Margaret professorship of Divinity, and gave up his Sarum prebend and London living; in 1662 he was made Master of Trinity College, Cambridge, and early in 1673 he succeeded Wilkins in the see of Chester. His *Vindiciæ Epistolæ S. Ignatii* (1672) was an able answer to M. Daillé, who had denied the genuineness of the epistles. In 1684 appeared his *Annales Cyprianici*. He died July 18, 1686. Pearson's posthumous works in Latin on sacred chronology were published by Dodwell (1688); his *Orationes*, his *Conciones ad Clerum*, and his *Determinationes Theologicæ* contain much valuable matter, for, as Bentley used to say, Pearson's very dust was gold. Baxter had a hearty respect for the learning and moderation of his weightiest antagonist; Evelyn valued his friendship highly; and Bishop Burnet thought him 'in all respects the greatest divine of his age,' and adds, but apparently without sufficient grounds, that he was 'a much better divine than a bishop.'

Admirable editions of the *Exposition on the Creed* are those by the Rev. Dr E. Burton (1833) and the Rev. Temple Chevallier (1849); of the *Minor Theological Works*, by Canon Churton (2 vols. 1844).
